

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 39.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The next number will be published on Monday, January 15, and advertisements should be sent in by January 10.*

*Subscribers to THE ACADEMY who find it difficult to receive the numbers regularly through the newsagents may secure their regular delivery on the day of publication, post-free, by order to the publishers, at 12s. per annum, or 6s. for 6 months, payable in advance.*

**The present Number begins the Third Volume of THE ACADEMY. The second Volume (October 1870 to December 1871) is now ready, bound in cloth, price 15s. Covers may be had of the Publishers, price 2s.**

## General Literature.

**Newman's Essays, Critical and Historical. Pickering, 1871.**

It is fortunate that the distinguished author has been induced to give these essays in an accessible form to the world at a time when they may still be useful in enabling contemporaries to understand him as far as it is possible to understand such an enigmatical figure at all. At present there is a tendency to regard him as a sort of second Pascal, a sincere and passionate sophist or a dialectician inspired by despairing love according as the individual reader happens to agree with his conclusions or to disagree. Without entering into a premature discussion of the relative rank of the two thinkers, it may be well to point out the more obvious traits that separate him both from Pascal and from another writer to whom he owes more if he do not resemble him more—we mean from Bishop Butler. Both Pascal and Butler stand of course in living relation to their age, but the argument of both is independent of their historical position. Dr. Newman will soon require as long an historical commentary as any Anglican divine of the seventeenth century. Again, though he shares with Pascal the irresistible tendency to extreme alternatives, he is as far as possible from Pascal's eager, impatient, diseased impetuosity; his mind moves cautiously and slowly, with perfect self-possession under all kinds of self-imposed moral and intellectual restraints. Then Pascal delights to throw everything into lurid picturesque antitheses. Dr. Newman prefers sober massive adumbrations of truth; he is only a dogmatist because he is penetrated with the importance of viewing religion as something thoroughly objective, as dealing with an order of definite spiritual facts, which exist in and for themselves before they exist for us. But this kind of dogmatism is not incompatible with such an abiding recognition of the inadequacy of language and thought as inclines him to resent the necessity of attempting precision at all, and to speak more than once as if the definitions extorted from the Church were one of the worst effects of heresy. Pascal and Butler are essentially sceptics: Butler seems to have no intellectual interests beyond the narrow circle of moral and spiritual probabilities to which he labours to bring every thought into captivity; Pascal uses his mastery of one form of positive knowledge to disparage that and all the rest. Newman, on the contrary, has a sincere respect for history and literature because he understands them; even his tendency to apply transcendental

VOL. III.—NO. 39.

solvents to the results of physical science is increasingly justified by the spontaneous progress of science, and of itself would hardly amount to scepticism. Perhaps it is this comprehensive justice rather than the undeniable difference of circumstances which accounts for the difference between him and his predecessors in their treatment of opponents. Pascal avowedly treats the world as a world of madmen who will think him mad; Butler does not affect to disguise his contempt for the frivolity of the persons of freethinkers any more than his concern at the gravity of their arguments. Newman, on the contrary, has no instinctive contempt for a thorough-going adversary at all; he feels that he is confronted by a complete, substantial, intelligible view with plenty to say for itself, by a view which he can enter into, nay, which he might easily share but for considerations which he feels in the last analysis are personal, though he necessarily believes that they are also normal. Or, to put the same thing in another way, Newman is tolerant of the worldly man's philosophy of the world, because to him the world is a good and beautiful thing in itself, although it was never the best thing and is now shamefully marred; Pascal, like Bossuet, can only see *le vide et le néant au fond des choses*; Butler can only see a theatre for moral action; Pascal is a Christian Nihilist, Butler is a Christian Stoic, Newman is a Christian Platonist.

Of course the characteristics of such a many-sided writer manifest themselves in different degrees in different works; in the present volumes the reader is struck principally by the thorough, not to say cruel, mortifications under which the writer's intellect has maintained its vigour, and by the way in which that intellect is, so to speak, encrusted with all kinds of historical accidents. For this last reason we are glad that the essays were republished while they are still intelligible: Dr. Newman is probably mistaken in thinking that there is any danger of their being reprinted "to serve the cause for which they were written;" at least it is hardly possible to imagine an Anglicanism of the future which anything like an honest reprint could serve; but it is also certain that a more disinterested curiosity would sooner or later insist on a complete edition of his work, and we have to thank him for meeting a demand which his modesty does not permit him to anticipate.

Writers who devote themselves to ecclesiastical subjects make many sacrifices, and not the least is that they subject themselves to the necessity of being useful: they have to refute everybody who for the moment is dangerous; they have to esteem all unobjectionable people who are doing good service; they have to answer every question which occupies the public, if possible in the very terms in which the public states it. For instance, in the admirable essay on Private Judgment, Dr. Newman has really given the *coup de grâce* to that interesting fetish, by showing that the majority of mankind never dream of exercising anything that can be called by the name, even when they set themselves seriously to choose or change a religion, and that if they attempted to exercise it the attempt would only bring out their utter incapacity. The work has been done, and it has not needed to be done again: those who maintain that assent ought upon the whole to follow the balance of producible evidence have been permanently driven back upon the uncomfortable and demoralising doctrine that the majority of mankind ought definitely to recognise their utter incompetence for rational assured belief, and make up their minds to get on as well as they can with feelings and practices, opinions and interests. If this had been all, it might have been ungracious to regret that the writer had done no more. But such rough iconoclasm was too unedifying to be really effectual, it was necessary to find pre-

cedents and promises in Scripture for the exercise of something that might be called private judgment in the sense of being individual, and to argue in the very spirit of Puritanism that whatever these did not cover was *ipso facto* illegitimate: while the whole is crowned by developing Butler's paradox that the contents of a revelation can never be criticised into the solemn conclusion that the only proper subject for private judgment is to be found in the two questions, What is the Church, and where is it? Of course, when the essay was written these things were more important than any historical enquiry into the origin of the enormous influence of the phrase and of the circumstances when it was least unmeaning, but the importance of such things does not last so long. There are too many illustrations of the same misfortune in the two volumes. No writer of Dr. Newman's eminence, except an ecclesiastical writer, would have condescended\* to take a man like Mr. Abbott seriously, only an ecclesiastical writer could have recommended a book so full of tedious shallowness, of ingenious dulness, as Palmer on the Church, without being blind to the defects which make the work an abomination to the natural man. But there are other peculiarities of the writer's position which illustrate ecclesiastical history on a side which is not repulsive. In these essays Anglicanism presents itself probably for the last time as a genuine product of the Church of England: not as a sort of dialectical necessity as the only hypothesis which meets the intellectual, historical, and moral conditions under which Englishmen can permanently maintain a religion, but as the sum of duties incumbent upon the Church of England man as such, hardly more disputable than tithe-paying or church-going, though some of them might be less obvious. Of course this involved a hearty acceptance of the positive side of the Protestant tradition, which had been renewed by the unexhausted influence of Methodism within and without the Establishment. Accordingly, in the very remarkable review of Milman's *History of Christianity* we find the doctrine of the Forgiveness of Sins put forward as the distinguishing essential feature of the Gospel dispensation. No doubt, as Dr. Newman points out, Milman's determination to conceive his subject in a purely external historical way led to the suppression of some of its most important aspects, of which this is certainly one. On the other hand, there is a whole school of Fathers with whom the forgiveness of sins, if not quite so completely thrown into the background as with Milman, is very far from being the centre of Christianity: it may almost be said in general that to converts from Judaism (and from forms of Christianity which may be said to Judaize) forgiveness is the important point, and deliverance and a new life to converts from heathenism (including the Neopaganism of almost all civilisation since the Renaissance). The fact is that it is much easier to be judicial when in possession of a complete system guaranteed by tradition and external authority than when a thinker has to construct one for himself out of a mass of incoherent texts and precedents by the aid of two or three principles with nothing to co-ordinate them. And this is the reason of Newman's severity to Erskine and Abbott. Their principle that nothing is admissible as dogma which cannot be translated into devotion might almost seem legitimate as the converse of the famous canon "*Lex orandi lex credendi*;" but in their hands this principle was a solvent of traditional orthodoxy, so they and their principle are branded as rationalists, whereas in truth they are no more rationalist than their critic when he makes forgiveness of sins the key to Christianity; the fact is, all three are Protestants. Another very remarkable feature of the essay on Milman is

the way in which the reviewer meets the attempt of that author to get rid of three-fourths of the doctrines and practices of the post-Apostolic Church by pointing out analogies (mostly fallacious) outside of Christianity. He sees that the analogies are fallacious, but he does not stop to prove it; he is willing to grant that they are genuine, that the Church really adopted these ideas from without, he only contests Milman's inference. Milman argues, "If so, it is so much the worse for the Church." Newman answers, "No, so much the better for the ideas which the Church has consecrated." This way of looking at things gives ecclesiastical authority all the advantages and all the disadvantages of flexibility.

The essay on the Catholicity of the Church of England is certainly one which believers in its doctrine would wish to have forgotten. Doctrines present themselves now full-grown, and Anglicanism among the rest: they walk the world unveiled, seeking believers where they can find them, alluring them by their sweetness, fascinating them by their stringency, subjugating them by their authority, rejoicing if they meet with any already half-converted by his habits or his desires, but willing to accept any convert as he comes, and to transform him afterwards. Newman, on the contrary, insists upon a preparation of the heart as a preliminary to the legitimate assent of the intellect such as no school of religionists ever ventured to demand except the earlier and better Jansenists, and even they undertook to reward by a certainty. Dr. Newman in 1840 knew the Fathers much too well to attempt to establish the Anglican position as certainly orthodox. And yet he was so much under the dominion of his inherited position as to take some kind of comfort in the thought that the claims of Rome were equally uncertain. He actually looked forward to bringing over his countrymen to the practical reception of a system morally and intellectually most exacting, and at the same time neither satisfying nor stimulating, although he could offer them nothing more than a presumption that their service was after all acceptable, and did not dream of denying that it was more than possible that, when they had done all, they would be still in heresy and schism. Pascal and Butler had contemplated the possibility of the believer being wrong, but even Pascal imagined no worse consequence of the error than that the Christian might find he had lost this world for nothing; to Butler, who thought it established that one ought to practise the virtues of Epictetus upon any hypothesis, the probability that his rudimentary Christianity was true could only be clear gain. The epilogue to this depressing production is a series of admirable reasons for dismissing the "dreary" question about Parker's consecration from the controversy between Rome and Canterbury: it is remarkable that even in this context it seems not to have occurred to the writer to examine the controversy between Rome and Constantinople, which turns exclusively upon questions equally "dreary." It is hard to say to what extent the notes are intended to be taken as complete, whether they contain all that Dr. Newman is inclined to add or the least that he thinks sufficient to neutralise what now seem old mistakes. Even on the latter theory they give the impression of a strange repose, as if the gigantic struggles of the author had been crowned at last by the inestimable blessing of being able to believe without having to remember why. He does not appear careful to refute his former self: he is satisfied when he has shifted the burden of proof.

The other essays must be briefly dismissed. The first on poetry is, if an horribly irreverent word may be pardoned, "donnish," its Platonism consists in a confusion of moral excellence with the poetical ideal; it is chiefly valuable for the observation that Byron's reputation rests largely on his rhetoric. In the third, the "fall" of Lamennais is treated

\* It is interesting to know that Mr. Abbott profited by the condescension, vol. i. p. 100.

without any of the sympathy which later revolts have excited among the representatives of Dr. Newman's old opinions. The fifth, on the theology of St. Ignatius, is an admirable piece of dialectical exposition: in the note the authority of the shorter Greek text is maintained against that of the Syriac by the usual conservative arguments; it was hardly to be expected that the writer should have followed the details of the controversy. For instance he does not mention the acute argument of Dr. Lightfoot from the variation in the superscriptions. The sixth, on the prospects of the Anglican Church, has been falsified by events. The author over-estimated the power of the school he founded, and he under-estimated the power of the traditional religion of England for both resistance and reaction. In the seventh, after summing up Dr. Caswall's statistics, Dr. Newman rebukes the Anglo-American Church for making a fetish of the Prayer-book, though he himself makes such a fetish of the parochial system as to be shocked to learn that the congregation always pay for their seats. In the eighth, the biographer of Lady Huntingdon and her surroundings are exposed with adequate severity: her ladyship is treated with incomprehensible generosity. The tenth summarises Dr. Todd's history of the origin of the superstition that the Pope is Antichrist, and reinforces his arguments by an ethical comparison of Bishop Newton and others, who made this superstition popular among Anglicans with some saints of the Counter-Reformation. The twelfth is a spirited review of Bowdler's *Hildebrand*: it has an appendix (from Father Ryder's reply to Mr. Ffoulkes) on the false Decretals, which does not contain a retraction of the statement in the text that St. Gregory VII. exceeded his legitimate powers when he deposed Henry IV., as much as Henry IV. did by deposing him. The admirable essay on Mr. Davison will leave, at least on those who did not know him, an impression that the writer was led to overrate his abilities by reverence for a singularly deep and earnest character. The fifteenth, on Keble, written for the *Dublin Review*, *à propos* of the *Lyra Innocentium*, contains a wonderfully just and delicate appreciation of one from whom the writer had so recently parted.

G. A. SIMCOX.

**Travels in Baltic Lands.** [*Utsäts a Balt-Tenger Vidtkein.*]

By P. Hunfalvy. Pest: Rath.

M. PAUL HUNFALVY is one of a small body of philologists in Hungary who have received from their less scientific countrymen the nickname of "Finn hussars," from their insisting on the claims of the Ugrian dialects to kinship with the Hungarian language. It would therefore be *à priori* probable, even if we were not expressly told so in the preface, that the attraction which drew him to the shores of the Baltic was a desire to make personal acquaintance with the closely related populations of Esthonia and Finland, whose dialects he had studied so long. At the same time, St. Petersburg, Stockholm, and Copenhagen were, as he says, too important points to be left out of a picture of that part of the world. His visit was made in the year 1869, and he was thus enabled to take part in the jubilee of the emancipation of the Est peasants, and in the Fourth Pre-historic Congress, held at Copenhagen.

The book has the defect into which many travellers fall, of mixing up personal experiences with statistical and other information which it scarcely requires a journey to collect. Considerable portions of it are evidently adapted to the meanest understanding. For an author to be able to assume on the part of his readers complete ignorance of the subject treated of is, to some extent, an advantage. It has enabled M. Hunfalvy to treat such questions as the geography of

Finland and the mutual connection of the Ugrian languages with a completeness which but few English writers of books of travels could venture on. Anxious to give the Hungarian public as much solid information as possible, our author has occasionally overloaded his pages with indigestible statistics, occasionally dwelt at length on subjects which scarcely come within the scope of his book, *e.g.* the emancipation of the Russian serfs.

The Baltic Provinces of Russia are a part of Europe comparatively little known, and what is known of them is derived from German sources alone. M. Hunfalvy himself is by no means a witness biassed against the Germans. In the first place he belongs to that party among the Hungarians who think their country's safety and prosperity best secured by a strict alliance with the German element in Austria. Like the great majority of his countrymen, he, too, shares in that feeling, half terror, half hatred, with which Russia is regarded in Germany, not to speak of more western countries. And he is withal a philologist. Still, the picture he gives of the country is drawn from a point of view so different from the Teutonic that the proportions of the various objects are materially altered. Nor does our author ever forget his own countrymen, or leave unimproved an opportunity of calling their attention to their many shortcomings. As he justly remarks in his preface, it is not good for the Hungarians to be always casting longing eyes on the power and greatness of fully developed nations, as it is easier to learn from them the airs of sovereignty and superiority than the means and methods by which they made themselves powerful. On the other hand, smaller and obscurer peoples afford oftener an instructive example of conscientious labour and a rational accommodation to the force of circumstances. Further, for a Hungarian, in whose country several nationalities struggle for existence of which even the strongest is not perfectly assured, the study of similar phenomena in other countries is full of instruction. The instances of Esthonia and Finland are the more instructive on account of the contrast each presents to the other. The Est nationality in Esthonia and Livonia was for centuries subject to the heavy yoke of servitude imposed on them by the feudal lords who represented the German conquerors of the country. The two provinces were continually exposed to Russian invasion while under the rule of the Teutonic Order, of Poland, and Sweden. Since 1819 the Est has been emancipated from servitude, but he is still subject to the many social disabilities which the feudal system leaves behind it. Finland, on the other hand, appears in our author's pages as an illustration of the dictum, "Happy is the country that has no history." Once conquered by Sweden (1157-1293), and subjected to the same system of government as that country, she had no reason for attempting to revolt. The most disastrous period of her history was that of her gradual annexation by Russia (1714-1809). Here it is worth observing that the Finns speak of the final annexation of their country by Russia as the recovery by Finland of the portions first conquered. The fortunate geographical position of Finland, lying as it does outside the main stream of European political movements, renders the relations between Finland and Russia almost as friendly and wholesome as those which formerly existed between Finland and Sweden.

Our traveller opens his book with a short description of the impressions made on him by the singular mediæval aspect of Danzig. His journey by railway to Königsberg affords him an opportunity of giving a brief sketch of the history of the Teutonic Order as well as a fellow-passenger's opinion of the Poles, whose history he considers an instructive warning to the Hungarians. In

Königsberg he is, of course, struck with the stamp the Hohenzollerns have left upon Prussia, and then hurries by the railway to Riga, the first point of his journey where he comes in contact with the Ests. But the elaborate German mediæval constitution, both of the city and the province, detains us for several pages. From Riga the author proceeds by sea to Reval, then by travelling all night arrives in Dorpat in time to witness the jubilee of Est freedom. Everywhere he finds traces of the subordinate position of the Est, and the prejudices entertained on the subject by the German *bourgeoisie*. Many of the citizens of Dorpat had expressed no little anxiety with regard to the behaviour of the *kuule*. This Est word, the imperative of the verb "to hear," is in Esthonia used by the Germans to designate the peasant. Before the Emancipation Act of 1819, peasant lands could only be let to Ests or Letts; the few Swedes and Russians in the three provinces being placed in this respect in the same category as the privileged Germans. On his way back to Reval by a different route, M. Hunfalvy traverses the country to which have attached themselves the mythological names of the Kalevipoeg, an inferior version of the Kalevala preserved by the Ests. From Reval he proceeds by steamer to St. Petersburg, to which capital he pays a flying visit, still keeping in the society of Ests and Finns, and from thence by like conveyance to Viborg, and from Viborg to Helsingfors. The farthest point in the interior of Finland to which he penetrated was through Tevastehus to Tammerfors, and from thence to Abo on his way to Stockholm. His journey through Finland was for the most part a succession of visits to fellow-philologists, of some of whom he had already made personal acquaintance during their visits to Hungary. Under such circumstances it is perhaps not to be wondered at that his pictures of the countries through which he hurried are somewhat too rose-coloured. Even of the Russians, his hostility to whom he does not disguise, he speaks with respect when he comes personally in contact with them. As to the Swedes and Danes he observes that the standard of comfort among them is superior not only to what he was accustomed to in his own country but even to that of Germany; and at the Prehistoric Congress he was struck by the superiority in stature and appearance of the Danes over their guests.

On two occasions he was gratified by a spontaneous and unexpected recognition on the part of Finns of their relationship to the Hungarians. In one case it was a small farmer in the south-western corner of Finland who entertained him on the strength of their kinship, which fact he had learnt through the medium of a Finnish periodical. In the other instance a colonel in the Russian army, who had taken part in the war against Hungary in 1849, told him that once during the campaign he particularly wanted to get some butter, but the Hungarian peasant-woman in the lonely *puszta* understood neither Russian nor German. In his eagerness he addressed her in Swedish and French, forgetting that these languages would be still more foreign to her. At last in his impatience he exclaimed in Finnish, *Anna minulle voita*, "Give me butter." Word for word the Hungarian translation would be, *Adj nekem vaját*. The similarity in sound of the two accusative cases at the end of the sentence was sufficient to enable the peasant-woman to understand and comply with his request.

The most interesting portion of the book contains an account of the preservation and discovery of the old poetry of the Ugrian peoples. After Lönnrot had written for two whole days from the dictation of a peasant in Russian Finland, who was eighty years of age, the old man exclaimed, "Ah, Sir, not one of my sons will become a singer as I did after my father; they prefer the vile new-fangled

songs with which I would not soil my mouth. Of the old songs which I learned in my youth I have forgotten the greater part, but if you had come in the days when my father was a fisherman in the lake of Lapukka, you would not have been able in two weeks to write down what he knew." Tears welled into the old man's eyes as he thus spoke, and Lönnrot himself could hardly control his emotion. As for the songs of the Voguls, the Hungarian traveller Reguly arrived just in time to collect the last of them. When Ahlqvist visited that country only ten years later, they were already forgotten. With regard to those of the Ests, M. Hunfalvy himself quotes from one of their own songs:—"As for the lays of old time, a thousand have been scattered to the winds, a thousand buried in the snow, a thousand have gone down into the tomb, and the fourth thousand slavery hath destroyed; as for those which the *munk* (knight of the Teutonic Order) swept away, the prayer of the priest overwhelmed, a thousand tongues were not able to recount them."

Whatever may be the fate reserved for the Ugrian peoples and their literatures, the sympathy felt for them by their Hungarian kinsmen (a result of philological culture which M. Hunfalvy's book seems intended to popularise) is a pleasant incident of the development of "nationalitarian" consciousness.

ARTHUR J. PATTERSON.

The Drama of Kings. By Robert Buchanan. Strahan and Co., 1871.

IN the decline of Greek art there arose an interesting school of painters who were called *ῥηπαρογράφοι*; their Parisian successors are known as realists. They painted still life with a predilection for rags and dunghills, and women whose hearts were better than their reputations and their circumstances. A few years ago the large and estimable class who are always on the watch for the coming poet believed that Mr. Buchanan was about to inaugurate a similar school of poetry, and rejoiced that the costermongers had found their Wordsworth. Of course the ideal calm and dignity of Wordsworth's dalesmen was neither possible nor desired; but London life abounds with situations which no one had dared to treat, and which, if treated with courageous sympathy, could not fail to be effective. Mr. Buchanan knew how to present the outside of a heartrending tragedy of the gutter or the garret with frank minute fidelity, and how to ventriloquise from inside of it with eloquence which was sometimes prolix and generally shrill, but always too inventive not to be telling. His admirers naturally expected that having struck a fruitful vein he would continue to work it; but they were mistaken, and really they ought to have known better. His *Undertones* had shown that he already possessed the inclination for transcendentalism of subject, though he had not yet learnt elevation of handling, and had to fill up a well conceived classical outline with stuff that a schoolboy might write for a music-hall. In the *Legends of Inverburn* he endeavoured without much success to relieve the homely texture of the idylls by the juxtaposition of weird mediæval grace; but the attempt itself was significant. The *Book of Orm* with all its elaborate indolent incompleteness of execution, and its multitude of metrical experiments, which owed more to the printer than to the poet, showed that the attempt was not unwarranted: the writer's ingenuity was as unmistakable, though not so conspicuous, as his fervour; he showed he could imagine as well as insist. One poem, *The Lamb of God*, even recalls the *naïve* audacity of Blake, though it has little of his swift fiery child-like subtlety. The *Drama of Kings* will confirm the impression which must have been left upon more than one reader of the *Book*

of *Orm*. Mr. Buchanan is essentially a spasmodic poet. His affinities are with *Festus* and *A Life Drama* and *Balder* and *The Roman*. He is free from the vagueness, the perplexity, the obscurity of his predecessors; he always writes as if he knew what he had to say, though Mr. Bailey's surviving admirers would probably maintain that that gentleman had something profounder to say if he could only say it; as compared with other poets Mr. Buchanan is long, as compared with his predecessors he is not tedious. The curious thing about him is that in his growing exaltation he should have almost exactly reversed the stages through which Mr. Alexander Smith subsided into a *littérateur*. But with these minor peculiarities he has all the essential characteristics of the school, its profusion of forcible conceits, the far-fetched paradoxes of its rhetoric, which serve to adorn and disguise its commonplace conceptions, and with these the disinterestedness, the genuine elevation, which comes of being habitually exercised in great matters which are too high for a man, and above all the perpetual excitement, the fever of composition, which is as nearly related to inspiration as prurience to passion. The delirium of this fever has its disadvantages and its compensations: it inflames the mental vision till it is incapable of appreciating the delicate harmonies and the noble repose of the ideal, or the real either for that matter; it flushes everything beautiful or no with a radiance that sometimes for the reader and always for the author supplies the place of beauty. Mr. Buchanan tells the adept in his note on mystic realism that he has hardly patience to read a book or look at a picture, and we who are not adept might have believed it even if we had not been told. At the same time it would be a mistake to suppose that in his more ambitious works he is remarkable for his independence of writers who had gone before him. It would be unreasonable to ask an *improvisatore* to be scrupulous in avoiding plagiarism. Only those who are calm enough to enter into the ideas of others are calm enough to foster their own till they are fit to appear full-fledged without the aid of borrowed plumage. Mr. Buchanan is quite considerable enough to have a manner of his own, at present he seems to be falling more and more into the least admirable manner of the author of *Songs before Sunrise*.

He is quite right in asking us to read through each play of his trilogy, or, if possible, the whole, at a sitting. This brings out the principal artistic merit of the volume—the skill with which the writer can strike into a new key at the beginning of a chorus, and relieve the passion, too often the coarseness, of the preceding scene. Besides, what was written eagerly ought at any rate to be read rapidly, so that the reader may be carried quickly over the roughness and vulgarities and prolixities that disfigure the rendering of a series of moods, which seem as if they might be elevated, if not subtle, but for the pervading lack of nobleness and intensity of expression, a lack not to be compensated by any amount of vigour, or ingenuity, or metrical fluency. The volume begins with a dedication to Auguste Comte: it is a hymn on the martyrdom of Paris, sweet, stately, solemn, and at least three times too long for its ideas. Then a proem full of empty double rhymes, a luxury the writer should leave to Mr. Swinburne, who can get at it without giving more than it is worth. Then a prelude in Heaven which serves its purpose well enough, being grandiose and inoffensive. A prologue spoken by Time, who announces himself at the end as Death, comes next: it is upon the whole impressive—it reminded me of Tennyson's *Tithonus*, but the impression remained. The first play of the trilogy shows Napoleon at Erfurt; the insolent *bonhomme* which he liked to affect is caught well enough. The admirers of

Louisa of Prussia will be disconcerted to find her celebrated appeal to Napoleon at Tilsit turned into a parody of a Shakespearian scolding-match, in which all the sovereigns at Erfurt take part. The anachronism is nothing, perhaps the aggravation of Napoleon's brutality is not much, but the writer has vulgarised his heroine. The dramatic climax of the play is that Napoleon quarrels with the pope, and is cursed by a cardinal, whereupon the chorus of spirits debate with really lyrical ingenuity whether they shall echo the curse. Napoleon soliloquises at great length on—

“What men call Liberty, and Gods call Peace.”

The thought of this soliloquy is admirably resumed in a choric interlude called the Titan, which is much the best thing in the volume: it is well conceived as a whole, and though the beginning may be rather overloaded, it grows up to perfect simple sweetness at last: it is, of course, too long to quote entire, and it would be cruelty to mutilate it. *O si sic omnia*.

The second part of the trilogy has less action than the first. Napoleon at Wilhelmshöhe hears news, and moralises and discusses the situation with a bishop, who states the cynical view of the strength of Catholicism with a certain imaginative *verve*. The ex-emperor is plausibly represented as a kind of pottering fatalist, who would be acute if he were not puzzle-headed and superstitious, who would be devout if he were not sceptical, and benevolent if querulous egotism had not made him heartless. It is superfluous to add that a great dramatist does not start with a string of adjectives, and try to animate them. The second choric interlude is on the refusal of English intervention. The first half is good political verse, musical, eloquent, passionate; the second a dull description of the perfect state, in the metre of Hood's *Bridge of Sighs*.

The beginning of the third play shows the advantage of remoteness of subject. Mr. Buchanan is quite right in thinking that the greatest art is never in revolt against the age which produces it or anxious to emancipate itself from its spirit; but he forgets that great art is generally the expression of a great epoch, and that artists of an epoch which is not great may do well to fly from what they cannot subdue, and what is hardly worth subduing. For himself he is resolved to idealise the present by foul means or fair; he will not look for a period in which women might meet and appeal to the chief of an invasion; he will introduce the sisters of the red cross wrangling with Bismarck, who, of course, forgets that he is speaking to ladies, and overwhelms them with foul and elaborate invective. If Mr. Buchanan did not think that a poem ought to be a pamphlet, and were not too earnest to study the appropriate, there are germs of fine things in the scene. A scene between the chorus and a deserter and several odes have something of the heroic extravagance of Victor Hugo. The chancellor's soliloquy and the scene between him and a deputy from Paris (Thiers and Favre rolled into one) recall the best heart-searchings of our esteemed contemporary the *Spectator*. There is nothing else to remark but Lucifer's statement in the epilogue that he took the parts of Bismarck and the two Napoleons because no one else would.

In a second edition, if Lucifer must tag his speech with Greek, the title had better be *δράμα κομπάνων*, and as Mr. Buchanan seems particular about acknowledgments, he had better remember that his dedication is in the metre of Mr. Browning's *Aben Ezra* (which had been already used for two hymns in the *Christian Year*), and that Shelley's *Hellas* is “a serious attempt to treat great contemporary events in a dramatic form,” and is certainly not more unreal than the *Drama of Kings*. The main faults of the book are

incurable, but the writer is not too old to learn. If he will clear his head once for all of his inflated notion of what poetry in general and his own poetry in particular ought to be, and would feed his imagination on something wholesomer than humanitarian rant, he might come to write verse that will live, or, if it is too late for that, he might come to leave off writing verses.

G. A. SIMCOX.

#### NOTE.

The Lord Chief Justice of England has undertaken to sum up, in a series of critical articles, the whole of the circumstantial evidence respecting the authorship of the *Letters of Junius*, including that of handwriting, as lately brought forward by the Hon. E. Twisleton and Mr. Chabot. The first article of the series will be published in our next number, January 15.

### Art and Archæology.

Raphael of Urbino and his Father, Giovanni Santi.

By J. D. Passavant. Macmillan, 1872.

THE coming of the New Year is now always heralded by the appearance amongst us of the richly illustrated gift-book, but it is very rarely that the New Year brings us a work of that class so excellent in its kind as the present volume. The only fault to be found with it is that the character of the contents is not sufficiently indicated by the title. The title leads us to expect a translation of Passavant's work, *Rafael von Urbino und sein Vater Giovanni Santi*, a book which, though possessed of independent literary merits, is pre-eminently a work of learning and research, for both in the French and German editions passages of general interest are buried out of sight beneath the conglomeration of professional criticisms and catalogues necessary to fit the work to take its place as a permanent authority and book of reference for students. Such professional criticisms and catalogues have been by the present translator and editor carefully suppressed, and the volume entitled *Raphael of Urbino* is not a translation, nor even an abridgment, of Passavant's book: it is not and does not assume to be intended for the use of students; the title can mislead but for a moment, and the briefest inspection reveals a magnificent *Prachtwerk* of a very high order of merit, especially calculated for the pleasure and profit of intelligent amateurs.

Twenty good engravings by some of the best artists, from some of the finest works of Raphael, have been admirably reproduced by the Woodbury autotype process. These engravings form the distinguishing feature of the book. The text indeed in all works of this class must necessarily be subordinate to the illustrations, and is usually vastly inferior to them. This last, however, is not the case in the present instance, as the photographs are accompanied by selections from the standard work of Passavant. Every passage of interest to the general reader is to be found in these pages. The preface to the German edition is given entire, and is succeeded by four chapters which contain substantially all that is known of Raphael's parentage and of his short and brilliant life with its varied relations and changing circumstances. The valuable chronologically arranged catalogue of his paintings follows, then comes a table of the same arranged according to subject, and the book is completed by a careful alphabetical index to its contents. From the popular character of the work it will be readily inferred that Raphael is regarded almost wholly as a painter, for unfinished work, even by the greatest of all

popular painters, has but a limited public; the catalogues therefore of his sketches and drawings, which would have weighted the volume to no purpose, have been omitted.

The translation, which has been very conscientiously done, shows even signs of something more than mere painstaking exactness, and though each word seems to have been carefully chosen, the language is markedly free and simple. Nay more, it preserves too something of a certain quaint charm of diction which exists, it is true, in the original, but which would only have been perceived and caught by a person of cultivated taste. Amongst the illustrations which have been selected so as to exemplify the different stages in the development of Raphael's genius, three may be specially mentioned as less well known to the public, and as being also particularly successful in point of reproduction, viz.: the Madonna of the Alba family, in the Hermitage, from the engraving by Desnoyers; the Christ on the Cross, in the possession of Earl Dudley, from the engraving by L. Grüner; the Coronation of the Virgin, in the Vatican, from the engraving by Stölzel, in which we find almost the full wonder of strange compound of early mysticism with the admirable science of later days. The outside of the book is not attractive, but the type and paper, as in all works printed at the Chiswick Press, are remarkably excellent.

E. F. S. PATTISON.

#### MR. HOLMES' CONCERTS AT ST. GEORGE'S HALL.

THE five chamber concerts under the direction of Mr. Henry Holmes, the last of which was given on Wednesday evening, the 20th ult., at St. George's Hall, have proved some of the most attractive of the many attractive concerts which have of late made Michaelmas Term—to Londoners once musically a blank—the most interesting of the year. The programmes have shown research and judgment. A place has been found in every one for some specimen of a composer comparatively unknown or as yet unaccepted, or for some comparatively unknown specimen of a well-known and accepted composer; while the remainder has generally been made up of compositions concerning the merits of which learned and unlearned have long ceased to differ, even among themselves. Thus, at the first concert, opened by a thoroughly characteristic and therefore beautiful specimen of Haydn's quartets, and closed by another of Mendelssohn's, we had a third—for pianoforte and bowed instruments—by Brahms, to many the most interesting of living and producing musicians. In like proportion, like compositions by Gade, Schubert, Schumann, Cipriani Potter, W. Sterndale Bennett, and Walter Macfarren have been heard after and before others by Haydn, Mozart, Beethoven, and Mendelssohn; these being intermixed with shorter, if not always lesser, solos, vocal as well as instrumental, performed by competent singers or one or other of Mr. Holmes' *collaborateurs*. These are Messrs. Foulkes (2nd violin), Burnett (viola), and Signor Pezze, assisted, when a second viola is needed, by Mr. W. H. Hann. Over and above the individual excellencies of these *virtuosi*—the fable of the bundle of sticks has no application to musical performance—they have been brought together by a community of sentiment, and have, by long association, attained to a power of expressing it which would inevitably be missed in the continued utterances even of greater artists who did not stand in the same relations to one another. The performance of Beethoven's quartet in C sharp minor, op. 131, at the last concert, might be confidently cited as having exhibited conception, finish, and sustaining power that it would be impossible to surpass. The interest of these concerts has been greatly increased by the appearance at two of them of Mr. W. H. Holmes, a pianist known and esteemed as he deserves to be among "experts," but whose public performances have of late been too few. The enthusiasm with which he was received, especially at the last concert, will, it may be hoped, tempt him on to the platform a little more frequently in future. It is understood that Mr. Henry Holmes and his party have made arrangements for another series of concerts after Christmas.

JOHN HULLAH.

## ART NOTES.

As French society reconstitutes itself, day by day, fresh gaps are perceived. The *Chronique des Arts* on the 10th December consecrates a notice to the memory of M. Émile Bellier de la Chavignerie, who died on the 6th February last, at the age of 49. His genius was distinguished by the rare union of zeal for laborious research with natural appreciative power in matters of art. He first became well known to the public by his charming biographies of Miger and Lantara. Only a few numbers of his *Dictionnaire général des Artistes de l'École française* have been published; and it is much to be regretted that his premature death should have put a stop to the completion of a task for which he had prepared himself by the arduous labours of twenty years. He entered an ambulance at the commencement of the siege of Paris, and through his untiring exertions for the sick and wounded, to whom he devoted himself, he contracted an illness which proved fatal.

Bernard-Romain Julien, born at Bayonne in 1802, died in his native town on the 3rd of last month. M. Julien was a pupil of Gros, but he very early abandoned painting for the lithographic pen, which has made him famous. In 1840 he published his first *Étude à Deux Crayons*, and achieved a popularity which never after abandoned him.

The *Moniteur universel* tells an extraordinary tale as to the preservation of the riches of Fontainebleau from the enemy. At the approach of the Prussians, M. Boyer, the *conservateur* of the *château*, hid every valuable in the labyrinth of cellars which exists beneath it. Prince Frederick Charles and all his staff were engaged for three months trying to find the treasure, without success; so they beat M. Boyer, stripped off his clothes, and put him in prison. As the article ends with suggesting that M. Boyer should be handsomely recompensed for running the risk of his life in the public service, we may hope that some one, in his zeal for the pecuniary interest of the honest *conservateur*, has embellished M. Boyer's statements. The *Moniteur* quotes as its authority no less a person than M. Pfnor, the well-known writer on the ancient *châteaux* of France.

The great room which precedes in the Bibliothèque Nationale the gallery in which is located the department "des Estampes," has been re-opened. Of old the walls of this room were covered by examples of the chef-d'œuvres of all the different schools. M. Henri Delaborde has now decided to have nothing but French work, in order to prove to the French, who are, he thinks, too inclined to think little of their nationality, that their own school is equal to all others.

In the *Gazette des Beaux-Arts* M. Firmin Didot calls attention to the curious similarity of style and subject existing between a picture now at Compiègne and a mark of the printer, Nicolas du Chemin, which is generally considered to have been designed by Jean Cousin.

In the annual report made by the abbé Cochet to the prefectoral administration of the Seine-Inférieure mention is made of the discovery of a Merovingian burying-place. Some of the tombs had been already violated, but still an abundant harvest remained to be reaped. There were found—38 vases of which 36 were pottery, 2 glass; a great quantity of coloured glass beads, forming a bracelet and two necklaces; iron was abundant, 14 lances, 8 axes, &c.; bronze yielded a vase, fibulas, 5 Roman coins, of which one was of Hadrian and 3 of Tetricus; gold was also very abundant; amongst various articles of less importance there occurred a pin for the hair set with lapis-lazuli, and 2 magnificent fibulæ, decorated with garnets and filagree. The crowning treasure was a unique silver coin of Theodebert 1st king of Austrasia (534-548); it is an imperial coin, adapted for the barbarian king. We see a Merovingian prince thus

substituting himself in the Arles workshop for the Cæsars of Rome and Byzantium.

The ruins of the magnificent cathedral of the ancient town of Parthenion have come to light. A new road is in course of construction in the Crimea, which passes at the foot of the Aion Dag, through a little eminence which has hitherto attracted no attention. In cutting through this elevation the workmen came upon walls. M. Stronkoff commenced excavations at once; the high altar has been laid bare, and a marble slab, which bears an inscription to the effect that the cathedral was built in the fifteenth century, during the episcopate of Theodore, in honour of the holy apostles.

Mr. W. Smith, vice-president of the trustees of the National Portrait Gallery, has empowered Mr. Redgrave to make a selection from his collection of water-colour paintings of as many rare examples as would illustrate the early period of the art. The works selected he has generously presented to the nation, and they will shortly be exhibited to the public at South Kensington.

Mr. Millais, R.A., has at this moment on the easel another large autumn landscape; and yet another, with figures, the subject of which is a ferry on the Tay. Mr. Leslie, A.R.A., has been painting a ferry on the Thames. The evening shadows over the river landscape are full of sentiment, and help the imagination to divine the story of the coming boat, in which a gentleman with two horses is ferried over, whilst a girl dressed in her riding-habit awaits him in eager expectation on the bank. A second picture by Mr. Leslie treats "Azaleas." Mr. Calderon, R.A., has been engaged on a portrait. Mr. Watts, R.A., has been modelling a life-size figure, "Psyche." Miss Durant is engaged on a portrait bust of a daughter of Mr. Frederick Lehmann.

M. Charles Blanc, director of the fine arts, has just received the sanction of the government for his scheme of forming at Paris a collection of copies which is to represent all the most important pictures of foreign galleries.

Several of the most important portions of the Louvre have been re-opened, viz., the Musée des Antiques; the hall of the Roman emperors; the small room of Diana with the doe, which unites that part of the Musée des Antiques which is in the old Louvre with the ground-floor of the Louvre of Louis XIV.; and also the nine rooms of the Musée Napoléon, in which the Campana collection is preserved.

The opening of the Salon for the exhibition of paintings is fixed for the 1st of May. Some remarkable alterations have been made in the conditions for the admission of works. First, there are to be no *exempts*; next, there are to be two classes of medals, and one grand medal to be conferred on the most important of the four sections; then, the jury is to be composed of members of the Institut, to whom the actual holders of medals will add a certain number of artists; finally, the entry will be gratuitous.

The bronze statue of the late Lord Holland, the work of Messrs. Watts and Boehm, will shortly be erected in the centre of the south side of Holland Park. Part of the park wall has already been removed.

The auction of the duplicates of the etchings and engravings of the Berlin Museum has been so far a great success. Dürer's "Hieronymus in his Cell" fetched 70 thalers. Tiny leaves of Altorfer hardly an inch square went for more than 26; the "Adam and Eve" of Burgmaier for 70; the "Adam and Eve" of Marc Antonio for 70; this, too, was a damaged example.

An exhibition of pictures representing the principal episodes of the history and siege of Paris has just been opened, 11, rue Le Peletier.

The committee formed for the erection at Macon of the statue to Lamartine has selected the Place de la Barre for the site.

It has also been decided that the statue shall be cast in bronze, although marble, "qui a les étincelles, les rayonnements et la pureté du génie de Lamartine," would have been preferable, did not its beauty suffer so soon from the influences of climate.

Baron Seymour Kirkup's library was brought to the hammer last week in London. The Baron was the hero of the discovery of the portrait of Dante, painted by Giotto on the wall of the Podestà at Florence (see *Academy*, vol. ii. pp. 59, 60). One of the most interesting items of the sale was a volume of the *Amoroso Convivio*, on the inside of the cover of which was a small but accurate drawing of the fresco of Dante, before it had been destroyed by modern restoration. The book fetched 5/.

The exhibition of Old Masters at the Royal Academy this winter promises again to be of great note. The Queen has lent twelve pictures, amongst which is a Holbein and a Vandyck. The Duke of Buccleuch, Sir Richard Wallace, and Mr. Baring have also liberally permitted selections to be made from their collections.

### Selected Articles.

Hans Lüttelburger, *Le Graveur des Simulacres de la Mort d'Holbein*. Edouard His. *Gazette des Beaux-Arts*, December, 1, 1871.

Ein Manuscript über die Statuen im Belvedere, C. Justi. *Preussische Jahrbücher*, December 1871. [The manuscript from which this article derives much of its interest was preserved in the library of the Colombaria Society at Florence. It appears to have been the joint work of Mengs and Winckelmann, and is especially noteworthy as throwing light on how much Winckelmann owed at first to the special knowledge of men like Mengs and Stosch.]

Die Basilica Julia am Forum zu Rom, A. Klugmann. *Im Neuen Reich*, No. 50, 1871. [A careful and exact report of the excavations and restorations now going on under the direction of Signor Rosa.]

Gött. gel. Anzeigen (Dec. 6) reviews Michaelis' important book on the Parthenon, which contains all the materials, and carefully distinguishes between what is certainly known and what is merely probable or possible. The reliefs on the east side represent the battles of the Giants; on the west those of the Amazons. The north side seems to contain Trojan scenes. The reviewers think it probable that the south side was devoted to the Argonauts. A careful analysis of the whole book is given.

*Nachrichten*, Nov. 29.—Sauppe discusses the inscriptions lately found in the temple at Selinas, which he thinks is a temple of Zeus Agoraios. Demeter is called *Μαλοφόρος*, Persephone *Πασικράτεια*, Ares perhaps *Φόβος*. The *β* in the word has the curious shape which accounts for *φοβος* and *φονος* being confused. The inscriptions seem to belong to the beginning of the fifth century B.C.

*Literarisches Centralblatt* (Dec. 16) notices Ilg's edition of Cennini's Book of Art (he was a painter of the Florentine school in the 14th century), and Allihn's Studies on Albert Dürer, at some length. The former is part of a collection of books on the history of art; and the reviewer recommends a similar collection for architecture, e.g. as to the first development of the Gothic in England and France, Suger's chronicle of his administration, and Gervasi's book on the burning and restoration of Canterbury. The latter tries to ascertain Dürer's meaning from the ideas of his time and the literature to which he had access, and is a good instance of the historical method.

### Theology.

The Religion of Israel. [*De Godsdienst van Israel.*] By Dr. A. Kuenen. Part I. Haarlem: Kruseman, 1869.

A STRICTLY historical description of the Israelitish religion is one of the fruits of modern critical theology. It was quite impossible, as long as the contents of the Old Testament were regarded almost exclusively as revelation. For revealed truth is inflexible, and can only be properly represented in the form of a dogmatic system, whereas religious ideas are bound up with the intellectual life of nations, and like it are subject to change; in other words, they have a

historical character. But although a strictly scientific method, as applied to the religion of Israel, is of modern origin, it is noteworthy that even the elder orthodox critics were able to distinguish something akin to a law of development. Who, indeed, could fail to observe that the outlines of prophetic religion were more distinct, and its affinities more evangelical, than those of Mosaic religion? The Biblical idea of the education of the human race was sufficient of itself to break up and paralyze the notion that the contents of Revelation must necessarily be of permanent validity.

Yet it must be owned that even those writers who have attempted to treat the religion of Israel historically have hitherto been very much inclined to presuppose the traditional authorship of the books of the Old Testament, and to assume that they are all of equal value as authorities for the ages to which they refer, rather than for those in which they were composed. And even if they admitted that the Hebrew writers had infused many ideas of their own time, the additions were regarded as unimportant. On the other hand, the critical basis (where such existed) of the earlier historical descriptions of Israelitish religion was easily shown to be untenable, as in the case of Vatke's *Biblische Theologie*, a work which did not deserve to fall so soon into oblivion.

The work we are about to review, from the pen of one of the ablest Dutch scholars, goes a step farther. Since it is the object of all science to make the nearest possible approximation to actual facts, we are bound, says Dr. Kuenen, as students of the religion of Israel, to investigate above all that portion of its contents which may be known with absolute certainty. This description, however, will not answer to Mosaism, though all other accounts of the Israelitish religion, not excepting those which follow an undogmatic method, begin with this period. It is extremely difficult to ascertain how much of the Pentateuch and its legislation really belongs to Moses, much more so than to sketch the broad outlines of the external events. For the very notion of a gradual modification, a Becoming, of religious ideas, is remote from those primitive times; we have no right, therefore, to apply a modern standard of historical fidelity to the early Hebrew chronicles. Consequently we must begin our investigation of the religion of Israel with the period which is comparatively well known to us, that of prophecy. Here, at any rate, we have access to numerous records, composed for the most part by the very men in whom religious enthusiasm reached its highest point, and who were animated by the religious idea in its greatest clearness.

And this is a point of view which cannot be reasonably impugned, especially when it is carried out with such learning and acuteness, such distinctness and moderation of tone, as in the work before us. Dr. Kuenen's method, therefore, is rather that of investigation than of description. The latter indeed corresponds better to the idea of a history, which seems to require a chronological thread, and the author will doubtless adopt this method as soon as we have reached a more definite knowledge of the earliest times of the Mosaic religion. But whichever method be preferable at the present moment, it is certain that we must decide at once whether we regard the books of the Old Testament as the absolutely faithful reflection of an immediate revelation, or as human writings, which exhibit the religious belief of the nation. The former is the older as it is still the popular opinion, and in its earliest stage, before it had received a logical precision, was not directly opposed to the latter. The author is quite right in insisting on the later view as the only possible basis of an impartial and purely scientific enquiry. Orthodoxy itself is obliged to exercise some criti-

cism on the contents of the Old Testament; since it regards Christianity as a more perfect religion than Judaism. It is obliged to distinguish between the belief of inspired and prophetic men and that of the people, and so to place the discourses of the friends of Job in quite another relation to the fountain of revelation than the words of Isaiah, though even in these it cannot yet discover the broad daylight of the Gospel, unless it is prepared to abolish the distinction of the divine covenants altogether. All these results are attained with greater thoroughness and completeness by the modern scientific method.

There is, however, another assumption on which our author in his introduction lays greater stress. He thinks we must regard the religion of Israel not as the principal religion outside Christianity, but only as one of the principal religions. It is difficult to see why this assumption should be of great importance for his particular task, which is simply to describe the Israelitish religion, not to compare it with others. Besides the antithesis is not precise enough. For if Israel had the principal religion, there may still be several other religions, which occupy an eminent position among their sisters. Before I have compared Judaism with these principal religions, I can say it belongs to the class of these principal religions. But if we are to estimate the comparative value of these religions, we cannot content ourselves with saying, This or that religion is one of the principal ones; but we must place it either above or beneath Buddhism, or Parsism, or Brahmanism. This is the function of the comparative history of religion, which has been so well described by Max Müller in his *Chips*. But our verdict, whatever it may be, can exercise no influence on our description of the religions themselves. It is another question whether the Israelitish religion alone is to be referred to a divine revelation, or other religions also. The former view is commonly regarded as that of the church, the mythology represented in the Greek and Roman poets being supposed to be the single source of the heathen religion; a view which conflicts with that of many of the fathers, who perceived traces of Christianity even in the heathen religions. As for the latter view, Dr. Kuenen rightly observes that it ought not to be based on the assertion of those who profess these religions. It rather depends—partly on the religious and moral value of a religion, which is determined by the contents of the latter—partly on a philosophical consideration of the origin and development of the various religions. For "revelation" points only to the highest cause of religion. The rejection of such a comparison of religions could only spring from the opinion that one religion alone was suitable for every race, but this error of the ancient world has been contradicted by history itself; not only Christianity, but also Islam and Buddhism, have passed from one great race to another; the alterations produced in a religion by such transitions are not fundamental. Another consequence of Dr. Kuenen's assumption is that he absolutely rejects the primary idea of "Jahvism," viz. that the Israelites were the chosen people of Jahveh. This position may be justified in two respects—1, in so far as the idea of election is merely an expression of national pride; and, 2, in so far as limited geographical knowledge made it impossible even for the prophets in their pictures of the future to bring the peculiar religious development of Israel into relation with the divine government by any other means. We must, however, guard against confusing the idea of election as originally conceived and expounded by the prophets with the fantastic notion of the Pharisees. With the prophets it denotes an act of divine grace, and involves more duties than privileges. We should also not forget that the limits of the religious community were ever much wider and more elastic than those of the

nation. Considered more closely, the idea of election seems to be the sound, though imperfect, expression of a vivid presentiment that the most distinguished rank in the religious development of humanity is assigned to this people—a presentiment which has also received the full sanction of history.

Following the method mentioned above, the author, in chap. i., describes the religion of Israel, as it appears in the great prophets of the eighth century. Jahveh is here the One God, who has chosen Israel, whom the nation has to obey, who declares his will distinctly through the prophets, and whose most conspicuous property is righteousness; in fact, we have before us the very essence of religion in all its grandeur and beauty. But this is not the only result to be gathered from the writings of the prophets. We learn, too, that the popular creed differed in many respects from that of the prophets. Jahveh was often forced to share his honours with other divinities; he himself was not yet recognised as the highest spiritual power; the popular conception brought him into too close a relation to natural elements, especially fire.

This mistaken and impure faith, which was often shared even by "prophets," is referred to repeatedly and in the clearest terms in the Old Testament. Dr. Kuenen has given an excellent picture of both kinds of the faith in Jahveh, although we should have liked to see many *momenta* in the purer creed (viz. the divine activity and the hope of salvation) drawn out at greater length. This slight deficiency, however, is almost justified by the fact that descriptions of the religion of Israel are still too often loaded with Christian and other foreign elements, which a strict historian and interpreter is compelled to disallow. In the second chapter, the author takes a retrospective view of the earlier eras. First, he gives us a historical survey of the history of Israel from the Exodus to the rise of the two kingdoms of Israel and Judah. Full and careful use is everywhere made of the latest researches. But little historical matter is found by the author in Genesis. This critical position approaches most nearly to Ewald's, combined with that of Graf, Bunsen, &c. He dates the Exodus B.C. 1320. In many points of detail we naturally differ from him, but we need not trouble the reader with all these, as the entire section refers to matters which must be presupposed, or, at most, sketched in outline, rather than proved, or drawn out at length, in a history of the Israelitish religion. One point only shall be mentioned. No doubt the purely genealogical view of history is "unhistorical" (p. 113); no doubt, too, geographical vicinity has often been converted into a proof of national kinship. But the numerous plurals and names of nations in Gen. x. prove clearly enough that the genealogists often intended to refer to nations and not to individuals, and the mere fact that the Philistines and Horites find no place in the framework shows that such writers were not by any means devoid of discrimination. On the other hand, we must beware of maintaining the converse; otherwise we shall have to deny any real affinity whatever, and forget that a nation is composed of families, and that a tribe might easily take its name from its first chief, or from the ruling family. There is no alternative but to subject each separate link in the genealogies to a searching examination, and it seems to us a mistake to allege the nature of the framework as in itself conclusive against an ethnological connection. Even the well-known capriciousness of late Arabic writers in the construction of genealogies (comp. Sprenger's *Life of Muhammad*) gives no better right to pass such a verdict. We hasten to add that this warning applies only to a very small extent to Dr. Kuenen, whose calm and temperate criticism is largely dis-

played in his treatment of this subject, but rather to other recent historians.

The third chapter discusses the formation of those communities of religious men incorrectly termed "the schools of the prophets," an important share in which, though scarcely one to be estimated precisely, belongs to Samuel. The author brings out very well the importance—often overlooked—of these communities; they continued long afterwards in both kingdoms, even in the time of the great prophets (Isaiah viii. 16), and were in many ways the chief support of the pure religion of Jahveh. Dr. Kuenen investigates with equal clearness "the Canaanitish origin of propheticism," which hitherto has not been adequately observed. It is true that the forms of Hebrew prophecy adduced for the purpose of comparison are the elementary ones. Not only did prophecy, through being spiritualised, receive quite other ideal contents than before, but its whole character was changed. No wonder that the Hebrew prophets, whose writings we possess, are infinitely remote from that primitive stage, and only the false prophets betray the origin of prophecy with comparative clearness.

The most difficult and at the same time most interesting question is discussed in the fourth chapter: What was the *earlier* development of the religion of Israel? Two views are possible, according to the author (p. 218, &c.). Either the impure elements in that religion were the consequences of a national *defection* from the pure and spiritual worship of Jahveh, or else they represent the original, out of which the more spiritual form developed itself by degrees through the agency of the prophets. Dr. Kuenen decides for the latter alternative. This view is supported by unmistakable expressions in the Old Testament, e.g. Josh. xxiv. 2, 14; Ezek. xx. 5; Amos v. 25, 26. And there is really no passage to be found where the whole people are said to have been faithful for any length of time to the pure worship of Jahveh. As the author very justly points out, Elijah and Elisha do not seem ever to have come forward against the calf-worship in the kingdom of Israel. Sensuous and spiritual elements are found side by side in the conception as well as in the cultus of Jahveh. The prophets indeed degraded the former into symbols, but they were once integral parts of the popular belief. Dr. Kuenen well illustrates this view by several usages in the worship of Jahveh, which reveal the early connection between Jahveh and fire in the popular mind, the bloody nature of his sacrificial ritual, and the absence of any specific distinction between him and nature-divinities like Molech and Kemosh. The view thus carried out in detail is in essential agreement with the opinion long current among critics, that impurities in the idea of Jahveh could not but tend to assimilate it to the type of the neighbouring divinities. It has also been generally recognised that a large number of the Pentateuch laws by no means institute new rites, but only modify or devise new motives for customs already in existence. Here, of course, we are restricted to conjectures, but to such as can be raised to a high degree of probability. Our author certainly deserves great credit for his description of the primitive popular belief. We think, however, that the distinction between the sensuous conception of Jahveh and the polytheistic requires to be drawn out still more sharply; we must not infer polytheism when we have barely proved the existence of other deities, not their worship. And even in the latter case we must still enquire whether these deities were co-ordinate with or subordinate to Jahveh. The discovery that monotheism and polytheism are by no means contradictory, but that the most various combinations and transitional stages occur, is the key to the comprehension of all the forms of historical religion, especially on Semitic soil.

But *how* did the sublime religion of the prophets develop out of this ancient popular faith? Was the latter the only germ out of which the former proceeded? Why, for instance, did not the religion of the Moabites, with which, perhaps, that popular faith had many points in common, develop in the same way? Was this great result produced, or, so to speak, distilled, in Israel by a kind of internal fermentation, which separated the spiritual from the sensual? Not a few are inclined so to imagine the process. It sometimes appears as if Dr. Kuenen were of the same opinion. But it is only appearance. New ideas, not involved in the popular belief, must have been introduced—ideas of sufficient power to effect a complete transformation in the several elements of the religion of Jahveh. And the representatives of these ideas were prophets. To what period, then, are we to assign the undisputed prevalence of that mixed popular belief? Dr. Kuenen recognises in Moses himself a prophet who introduced such new ideas. The period we are in search of must therefore fall before Moses, *i.e.* before the national life of Israel can strictly be said to have begun. But the tradition that Moses stood in a close relation to older and yet higher, and not merely Egyptian, conceptions of religion—is it a complete delusion? If it is not so, we shall arrive at those obscure times in which the Israelitish nation was gradually developed. And we shall be unable to deny the possibility of prophetic action even in those early times in the Semitic group from which the people of Israel sprang. A further question which arises is this: How far did the conviction of these ancient prophets deviate from the popular belief which they sought to transform? The answer is difficult, as we have no contemporary evidence for this primitive period. It is only too natural that scholars should differ on a point in which so much depends on conjecture. In the case of Moses, Dr. Kuenen admits unreservedly the fact of such a deviation, but he thinks that it did not go so far as the negation of image-worship and the assertion of the absolute uniqueness of Jahveh. If, however, we estimate the difference between Moses and the people at too low a rate, we shall hardly be able to explain the intense veneration for the former embodied in the tradition. The narrative of the golden calf is not so much a piece of historical evidence as the symbolical expression of the view that the priests took comparatively a slender share in this religious movement.

The picture of the early religion of Israel drawn by Dr. Kuenen appears at first sight to differ considerably from the ordinary one, though the former, as we have seen, corresponds pretty closely in its main outlines to the results as yet gained by criticism. The dispute is to a large extent about mere words. By the "religion of Israel" we may mean either the old popular belief marked with the stamp of heathenism, or the purer conception of the prophets. Which has the best claim to the title? In our opinion, the latter alone. The crude notions of the mass of the Jews have as little right to be called by this name as the religious ideas of the Neapolitan peasantry to be accepted as the standard of Roman Catholicism. Besides, there is no specific distinction between the popular belief of the Jews and that of their neighbours, while the expression "religion of Israel" is absolutely unmeaning, unless it sums up that which was peculiar and distinctive; in other words, the essential elements of the prophetic ideas. History itself imposes this condition. The Jewish nation, when arrived at maturity, have, through their representatives, only preserved those writings as records of their true religion which exhibit the higher and purer faith. No literary record stands only on the foundation of the old popular belief. Even the "Mosaic" laws were not generally recognised until Deuteronomy—a genuine prophetic work—had been appended as a key and corrective. As for

the purely religious point of view, it is at any rate justifiable in explaining the origin of the prophetic movement, since it is a mere evasion to reply that its leaders were religious geniuses; the continuity, consistency, and strangely transforming influence of the prophetic spirit cannot be accounted for by phrases of this sort. Of course this religious theory, true as it is, or rather because it is true, ought never to be allowed to check the course of historical enquiry; it can only be properly applied to illustrate the ultimate causes of historically developed facts. To speak of "revelation" at this point is allowed, or rather demanded, by science itself.

We know but little for certain as to the religion of primitive times, and the author is disposed to confine the true prophetic influences of the period within very narrow limits. It is probable enough that there were still many soothsayers of the class of a Balaam in addition to the prophets, and this is confirmed by the historical and prophetic books. Dr. Kuenen proceeds to describe the times of the judges and the kings, with the object of arriving at the average belief of the people themselves. His description is not incorrect; on the contrary, this part of his book contains some interesting contributions to criticism. It is not a declension from Jahveh, as the religious theory of the Book of Judges regards it, which characterizes the time of the judges; but the worship of the *local* deities by the side of Jahveh. The latter was recognised as the god of the nation and the country, but the lesser deities, the Baalim, stood in a more intimate relation. The more religious Israelites indeed had a special reverence for Jahveh, but made no attempt to disturb the other divinities; in short, even they did not regard Jahveh as the one only God, beside whom the gods of the heathen were things of nought (*Eilim*). This is proved in the cases of David and Solomon, Asa and Jehoshaphat. The exclusive recognition of Jahveh was first attained in the northern kingdom, when Jahveh was in danger of being supplanted by Baal as the one supreme God. This attempted revolution fortunately provoked a reaction, and the victory over the supreme Baal involved a victory over the lower Baalim. Not indeed at once, but gradually. These results have a rather monotonous aspect, in so far as the extent of Jahveh's power, rather than the mode of his operations, sometimes almost seems to form the only contents of the higher religion. The author does not go so far as to regard this notion (Jahveh *by the side of* other deities) as the only test of the value of this religion, as it is essentially an act of the understanding; still he is on the verge of doing so. The notion is in his view a sign of a "barbarous" age. Dr. Kuenen involves himself in some difficulty by placing the transition from a more than semi-heathenish form of religion to the pure conception of the prophets Amos, Hosea, and Isaiah as late as the ninth century. We are afraid this giant-stride is not sufficiently explained. He estimates the popular belief of the southern kingdom in no essential respect more highly than that of the north, although there was no struggle between Jahveh and Baal in the south analogous to that in the north, while the prophets of Judah even dwell with emphasis on the unique character of Jahveh. Another striking fact is that in the prophetic expositions of the latter doctrine there is scarcely any vestige of a conflict with Baal, although on Dr. Kuenen's hypothesis we might expect some such involuntary allusions. We may infer therefore that the importance attached to Jahveh in the popular religion of Judah is rather underrated by our author. It is equally improbable that a purer idea of the nature of God was preserved by tradition in a few families alone. The worship on the "high places" was certainly not altogether so "innocent" as many have supposed. Dr. Kuenen indeed accepts the judgment of the Book of Kings,

and regards the "high places" as entirely idolatrous. Were this, however, exclusively the case, the earlier prophets would certainly have been much louder in their denunciations. Besides, the command to worship Jahveh only in Jerusalem points to the existence of numerous sanctuaries consecrated to Jahveh, but too much withdrawn from the sacerdotal control. In short, the author has looked sharply after the dark side of Israelitish religion, but in so doing has missed much of the light. He follows the religious criticism of the historical books; indeed, his judgment turns out even more severe than theirs. On the other hand, he bestows much too little attention on the Psalms and the Proverbs. He deems scarcely any statements but such as are unfavourable to the state of religion historically "certain." But though it is impossible to fix the precise dates of the Psalms, it is highly improbable that no song of the collection falls earlier than the ninth century. And if even a part be earlier, it must be employed as a historical authority. The author's view that the more ancient portions of the Pentateuch were not in existence before the eighth century is equally improbable, and opposed to that of most critics. At any rate he cannot avoid the task of analyzing these records, with the view of detecting still more ancient records, and employing them in his description of early religion.

The foregoing criticisms are obviously directed not so much against the results of Dr. Kuenen's enquiry as against its completeness. They are not intended to depreciate in the least the great importance of his work for the scientific study of the Old Testament. No doubt he has dealt a severe blow to the custom of writing Jewish history from a dogmatic point of view. Truth, however, has sustained no real injury. Many, very many, of his details are still questionable; it could not however be otherwise, considering the abundance of the material. Each chapter is followed by valuable notes, which often contain long and important excursions, e.g. that on the chronology (chap. ii.), and the argument in proof of the genuine Israelitish character of the name and doctrine of Jahveh. We hope for an early opportunity of noticing the second volume; the present concludes with the Babylonian exile. L. DIESTEL.

#### DISCOVERY OF A PSALMIST.

##### TO THE EDITOR OF THE ACADEMY.

SIR,—In the prayer-book of the Jews alphabetical hymns are of very frequent occurrence. It is an invariable rule with them to express the name of the author in the verses following the end of the alphabet. If the  $\Pi$ - or  $\aleph$ -verse (in case the alphabet is used in the inverse order) is followed by anything else, we are sure to find שמעון, שלמה, or יצחק, or some other name, marked by the acrostic.

If we apply this rule to Psalms xxv. and xxxiv., where the  $\Pi$  verse is followed by a single verse, which does not belong to the alphabetical arrangement, we are entitled to say that the author of Psalm xxv. was one פדהאל, the author of Psalm xxxiv. one פדהיה, as of course the  $\aleph$  of פודה, Psalm. xxxiv. 23, did not originally form part of the text. Phadael is undoubtedly the person mentioned in Nehem. viii. 4 as a contemporary of Ezra, and who held a high rank in the Jewish community at that time. Phadaias might have been a brother of Phadael. The orthography פדהאל is as עשהאל, פדהצור. The name Phadael itself is written פדהאל, Num. xxxiv. 28.

So for the first time the true name of a psalmist has come to light.

Göttingen, Dec. 6, 1871.

PAUL DE LAGARDE.

#### Intelligence.

Two of the most difficult German authors, Ewald and Dörner, have been singularly fortunate in their translators. The standing-point of the *History of Israel*, the third volume of which, in two parts, has just

appeared in a delightful English dress, received a careful appreciation in the *Academy* (vol. i. pp. 201–203). A similar attempt to "orientate" the reader of the *History of Protestant Theology* is unnecessary, in spite of the misconceptions which in England have gathered round the name of Dörner, because the main difficulty in understanding that author is caused by the obscurity of his style, which is reduced to a minimum in this very readable version of his most intelligible work. On the other hand, the principal obstacle to a just estimate of Ewald is, not the cumbrousness of his style, but his natural incapacity for discussion, a defect which cannot be remedied by any translation of his works, however skillfully executed. Without pledging ourselves by any means to agreement with all Dörner's views, we strongly recommend his *History* to those who are beginning the scientific study of theology. The third book, in particular, on the theology of the nineteenth century, deserves the closest attention of the student, who may be surprised to find how much critical and speculative liberality enters into the composition of a German "orthodox" leader. It is characteristic of the wide information of the author that he concludes his work with sketches of contemporary foreign theology. These are of very unequal merit, but none the less welcome, as indications of a broader conception of the history of theology than is perhaps common in Germany. The sketches of Dutch, Scotch, and English—or rather Anglican—theology are the least satisfactory. The best passage on the latter is the criticism on Dean Mansel (vol. ii. pp. 494, 495); the worst, that on *Essays and Reviews* (p. 496), where the author, strangely enough, deserts the very principles of exegesis which he has previously recognised. A severe article by Prof. Diestel in the *Jahrbücher für deutsche Theologie* is still the best thing which has been written on that celebrated work. In the earlier English theology and philosophy, as well as, of course, in those of his own country, the author is evidently at home, and even those who differ, as most occasionally will, from his interpretation of facts, will appreciate the moderate tone in which it is stated.

#### Contents of the Journals.

Archiv f. wiss. Erforschung d. Alten Test., Bd. ii. Hft. ii.—M. J. De Saulcy before the tribunal of truth and science, by T. Tobler.—Philonian studies, by C. Siegfried. [Seeks to show that Philo participated in a traditional knowledge of Hebrew.]—The 70 shepherds of the book of Enoch and their interpretations, with especial reference to the Barkochba hypothesis, by O. Gebhardt. [Concludes that the Ethiopic version is too inaccurate to be a safe guide in obscure passages.]—The Targum on Proverbs dependent on the Peshita, by Th. Nöldeke.—Job xxx. 11, by Ad. Merx.

Monatschrift für Gesch. u. Wiss. d. Judenthums.—Dr. Grätz has published a series of striking articles on the Scriptures subsequent to the return from the exile. Daniel is treated in the August, September, and October numbers, the canonicity of Esther in that for November, and the 119th Psalm—which is ascribed to Onias, founder of the temple at Leontopolis—in that for December.

Centralblatt, Dec. 16.—Merx's Job, rev. by E. S. [Rejects the author's principles of text-correction, but agrees with him in taking the half-verse as the metrical base.]—Kleinert on Deuteronomy, by the same.

Jahrbücher für deutsche Theologie, vol. xvi. No. 4.—See especially reviews of Scholten's Aeltestes Evangelium, Meyer on the Gospel of John, Krenkel's Paulus, by Weizsäcker, and of Martensen's Christliche Ethik, by Palmer.

#### New Publications.

BEGNI, G. L' Ecclesiaste secondo il testo ebraico. Doppia traduzione con premio e note. Florence: Cellini. [Said to be the work of a good Orientalist, who is extensively acquainted with modern and even Protestant works on the subject.]

COLENSO, J. W. The Pentateuch and Book of Joshua Critically Examined. Part VI. Longmans.

FFOULKES, E. S. The Athanasian Creed, By Whom Written and By Whom Published. Hayes.

GRÄTZ, H. Schir ha-Schirim, od. das Salomonische Hohelied. Vienna: Braumüller.

ORIGENIS Hexaplorum quae supersunt. Concinnavit etc. F. Field. Tom. I. Fasc. i. Clarendon Press.

RAUWENHOFF, L. W. E. Geschiedenis van het Protestantisme. Parts 1–3. Haarlem.

TESTAMENTUM NOVUM Graece [Tischendorf]. Ed. VIII. Fasc. 9. Leipzig: Giesecke und Devrient.

## Physical Science.

**Blood Crystals.** [*Blutkrystalle.* Von W. Preyer. Mit 3 gefärbten Tafeln.] Jena: Mauke.

THIS is one of those monographs, unfortunately too rare in our own country, which are so useful to those engaged in special enquiries, as giving in a continuous and condensed form all the more important facts and opinions up to the date of publication. It must not, however, be supposed that it is a mere literary compilation. On the contrary, it is the production of one who has himself contributed much to the subject by his own investigations, and contains a considerable amount of original material. Though the title of the work is *Blood Crystals*, it is, strictly speaking, an account of what is known respecting the physical and chemical characters of the red colouring matter of the blood (hæmoglobin), and of various products derived from or closely connected with it. From whatever point of view we look on this substance, it must be regarded as one of the most important and remarkable presented to us for investigation. Though it may be obtained in perfectly well-defined crystals by methods described by the author, yet it has the characters, not of a crystalloid, but of a colloid substance, and will not diffuse through membranes. The chemical composition is also most remarkable. Besides the usual carbon, hydrogen, nitrogen, and oxygen, it contains iron and sulphur as essential constituents, and has the extraordinarily complex constitution expressed by the formula  $C_{400}H_{200}N_{164}Fe_2S_2O_{170}$ , the atomic weight being no less than 13332 ( $H = 1, O = 16$ ). Such being the case, it is no wonder that the products of its decomposition already known should be very numerous, and that very much still remains to be learned. The optical characters of hæmoglobin are remarkable, and very characteristic. As far as they are concerned, no difference can be detected between that met with in different animals. It is the same, not only in all the Vertebrata, but also in some Crustacea, Mollusca, and Annelida. It however appears to be satisfactorily proved that there is some essential difference even between the hæmoglobin of different species of Mammalia. The crystals belong to two distinct systems (rhombic and hexagonal), and differ further in the secondary forms, and in solubility. Whether this depends on the hæmoglobin itself or on the presence of some other substance, it is manifestly an extremely interesting question, not only in connection with physiology, but also in its practical application in the examination of blood-stains. The value of this test is however much impaired by the necessity of our examining fresh and unaltered blood; and the author concludes that it cannot be relied on as a means for distinguishing human from other blood; but at the same time the facts are so striking that perhaps it would be premature to abandon all hope of being able to make use of such a test in certain cases.

One of the most remarkable peculiarities of hæmoglobin, and that which enables it to play such an important part in the animal economy, is the property it possesses of combining loosely with oxygen when exposed to the air, and readily giving it up to oxidizable substances. According to the author the constitution of the oxidized modification may be expressed by  $O_2\{Hb$ . These two atoms of oxygen can be removed by the air-pump, and the crystals of the deoxidized modification (Hb) are of the same form as that of the oxidized, but of a different colour, and give an entirely different spectrum. This loosely combined oxygen may also be replaced by other gases, according to a special law, not that of actual chemical substitution. Thus in the case of

carbonic oxide, CO replaces  $O_2$ , and not simply O. Other similar substitutions occur, the principal of which are given by the author in the following manner, though the constitution of some is so far somewhat hypothetical:  $NO, Hb ; CyH \left\{ \begin{smallmatrix} O \\ O \end{smallmatrix} \right\} Hb$ , which can be reduced by deoxidiza-

tion to  $CyH, Hb ; \left\{ \begin{smallmatrix} S \\ O \end{smallmatrix} \right\} Hb$ , which may in a similar manner

be reduced to SHb. The compounds  $\left\{ \begin{smallmatrix} S \\ S \end{smallmatrix} \right\} Hb$  and  $\left\{ \begin{smallmatrix} H_2 \\ S \end{smallmatrix} \right\} Hb$  are also very probable. This substitution of O with other gases in great measure explains their poisonous action. According to the author deoxidized hæmoglobin can be restored to the oxidized modification by no other means than exposure to oxygen in a gaseous state.

The products of the decomposition of hæmoglobin are very numerous, and present many facts of great interest. One of these is the only pure albuminous substance hitherto prepared. Though that is such a complex body, yet hæmoglobin is so much more so that it splits up into coloured compounds, and this colourless albumen. When exposed dry to the air, blood or pure crystalline hæmoglobin gives rise to a new substance of albuminous nature, for which the name *methæmoglobin* has been most generally adopted; and, since this compound is of great interest in connection with blood-stains that have been exposed for a while to the air, I have myself made it the object of very special study, and this leads me to differ from the author in certain particulars. He appears to me to have overlooked the changes produced in the spectrum by the presence of alkalis and acids. According to my experiments, when the solution contains as much of some weak acid as the methæmoglobin will bear without decomposition, the absorption-band in the red is so much increased in relative intensity that it may almost be said to exist alone. When nearly neutral, the spectrum shows four bands, as described by the author; but on adding excess of ammonia, two of these, which are nearly in the same position as those of oxidized hæmoglobin, are made much darker, that in the red is removed, and an entirely new band developed in the orange, so as to give the author's spectrum, plate ii. fig. 8. This he describes as that of a product of the oxidization of oxidized hæmoglobin, with which view I entirely agree; but that it is only the alkaline modification of methæmoglobin is proved by our being able to change it into the ordinary four-banded spectrum, backwards and forwards over and over again, just as we can restore the blue colour to litmus reddened by an acid. The nature of methæmoglobin is, in my opinion, well shown by the following experiment. To a solution of oxidized hæmoglobin, giving the spectrum distinctly, carbonate of ammonia and a slight excess of ammonia are added, and then a very small quantity of a solution of permanganate of potash, until the spectrum is seen to have three much less dark absorption-bands of nearly equal intensity. On adding a little citric acid to neutralise all the free ammonia and cause slight effervescence, so that the solution may contain free carbonic acid, but no free citric, the four-banded spectrum may be recognised, and then the addition of a very minute quantity of the double sulphate of protoxide of iron and ammonia gradually changes this directly into the original spectrum of oxidized hæmoglobin, without the intermediate production of the deoxidized modification. I therefore contend that methæmoglobin is derived from oxidized hæmoglobin by the introduction of a small quantity of oxygen, in such a manner that it may be removed by deoxidizing reagents, and the hæmoglobin restored to its original state.

The chief coloured products of the decomposition of hæmoglobin described in detail by the author are hæmin,

hæmatoin, and hæmatin. He also notices more briefly some less understood colouring matters met with in living animals, which may perhaps be derived from the colouring matter of the blood, and various artificial products obtained by Hoppe-Seyler. The number of products that could be obtained from such a complex substance is no doubt great, and I could myself add five or six which give entirely different and well-marked spectra.

Hæmatin contains no albuminous substance, is free from sulphur, but contains iron as an essential ingredient. According to Hoppe-Seyler its composition is  $C_{68}H_{70}N_8Fe_2O_{10}$ . Hæmin contains chlorine as well as iron, and its composition is  $C_{68}H_{72}N_8Fe_2Cl_2O_{10}$ . Hæmatoin is free from iron, and its composition  $C_{68}H_{74}N_8O_{12}$ , being thus hæmatin -  $Fe_2 + 2$  aq.

According to the author, what has hitherto been considered to be the spectrum characteristic of acid hæmatin is really that of hæmatoin. He contends that when a free acid is in the solution the hæmatin is deprived of its combined iron, and is changed for the time into hæmatoin, but that on adding an alkali the iron re-combines, and hæmatin is reproduced. What he thus names *hæmatoin*, he thinks is probably identical with the iron-free hæmatin formed by the action of concentrated sulphuric acid on hæmoglobin, &c. (Thudichum's *cruentine*). These views are very simple and ingenious, but I must confess that my experiments lead me to believe that there are really several distinct substances, and that the facts are much more complex—at all events too complex to be described now.

The chapter on the detection of blood by the spectrum method is, in my opinion, not on a level with our present knowledge, but fully confirms the views of those who argue that no other known substance gives the same spectra as those of blood. The methods described by the author would enable an experimenter to recognise a moderately small quantity of fresh blood on an inert fabric, but they would probably fail if the stain had been exposed for a few days to the impure air of a large town, and certainly if the quantity were very minute, if particular mordants had been used in dyeing the fabric, or if it had been soiled by dirt or perspiration, and still more so if it were on leather and had been partially removed by water.

In the last chapter the author discusses certain points connected with the physiological action of the red colouring of the blood. He shows that nearly all the oxygen of the blood which is available for oxidizing purposes is that loosely combined with the hæmoglobin, and argues that the difference between the arterial and venous blood in the fœtus proves that oxygen may pass from the red globules through the membranes of the capillaries; in this case, of course, through those of the placenta. He also shows that almost the whole of the iron in the blood is that contained as an essential constituent in the hæmoglobin. In conclusion, the work contains a list of about two hundred memoirs connected with the subject, with full and complete references.

Though I have thus somewhat freely criticised certain portions, yet I must express my great admiration of the work as a whole, and recommend it strongly to the attention of those interested in such an important subject as physiological chemistry.

H. C. SORBY.

### Scientific Notes.

#### Physiology.

**The Tone of the Voluntary Muscles.**—Georg Heidenhain contributes an essay (*Pflüger's Archiv für die gesammte Physiologie*, Band iv. Heft. x.) on the influence of the posterior roots of the spinal cord on the excitability of the anterior. These experiments deal essentially with the nature and cause of the tone of the voluntary muscles. Harless

conceived that the stimulus to maintain this tone was constantly being transmitted by the sensory fibres of the muscle in a direction contrary to that in which they ordinarily convey impressions; whilst Cyon maintained that the motor nerves were constantly being excited by peripheric irritations, which stimulated the sensory nerves, and were conducted by them in the ordinary mode through the posterior to the anterior roots. Heidenhain is opposed to both views, and believes that no influence of the kind is exerted. The tone of the muscles, it would appear from Schwalbe's and Heidenhain's experiments, is simply their natural condition of healthy nutrition, independent of the nervous supply; for if, as the former has shown, the sciatic of a frog be so suddenly utterly destroyed that no convulsion of the gastrocnemius occurs, it will be found that this muscle does not undergo the slightest elongation.

**Tension of the Gases of the Blood of the Capillaries.**—Siegfried Wolffberg (in the same part of *Pflüger's Archiv*) discusses the tension of the gases of the blood in the capillaries of the lungs, gives the results of many experiments, and arrives at the following conclusions:—(a) The tension of the oxygen of the blood entering the capillaries of the lungs amounts on the average to 27 millimetres of mercury. (b) The tension of the carbonic acid in the capillaries of the lungs is on the average equal to 24 millimetres of mercury. (c) The expired air contains on the average 2·8 per cent. carbonic acid and 16·6 oxygen. (d) The tension of the carbonic acid of the blood of the pulmonary artery is equivalent to an atmosphere containing from 3·6 to 5·1 per cent. of carbonic acid.

**The Metamorphosis of Tissue.**—Dr. Paalzow has a paper in the same Part on the influence of irritation of the skin on metamorphosis of tissue. He shows that when tracheotomized rabbits were immersed in water charged with carbonic acid, and kept at an even temperature, no increase in the amount of carbonic acid expired occurred; but when mustard was added, there was a considerable increase in the amount of oxygen inspired, and of carbonic acid expired, showing augmented metamorphosis of tissue.

In *Pflüger's Archiv*, Band iv. Heft x., moreover, Gustav Strassburg describes the action of acids on the oxygen of the hæmoglobin of the blood, and shows that their action is to diminish the quantity of oxygen with which it is combined. The same author gives a modification of Pettenkofer's test for the detection of the biliary acids in the urine, by means of which he can detect 3·100000ths of a grain. It consists in dipping a piece of filtering paper in the urine, to which cane sugar has been previously added, drying it, and then dropping some concentrated sulphuric acid upon it. A beautiful violet tint appears.

Prof. A. Heynsius and Dr. J. F. F. Campbell communicate at considerable length their researches on the products of the oxidation of the biliary colouring matters, and their absorption bands when examined with the spectroscope. In an introductory chapter they give a very complete résumé of Städeler's and Jaffé's observations, as well as the more recent ones of Maly, Thudichum, Bogomoloff, and others.

*Pflüger's Archiv*, Band iv. Heft xii., contains only three papers, the last of which however is of considerable length. In the first, Heidenhain endeavours to refute the theory recently advanced by Cyon in regard to the centric origin of the vascular nerves. In the second, the same author, Heidenhain, gives the details of his experiments on the much discussed question of the relative temperature of the right and left sides of the heart. He agrees with Bernard and G. Liebig that there is always or almost always a difference between the two; the right being  $0^{\circ}1$  to  $0^{\circ}3$  or in extreme cases as much as  $0^{\circ}6$  Cent. higher than the left. The last paper is by M. Eichhorst on the absorption of albuminates in the large intestine. The essay is a valuable one; and the author gives the results of his observations as follows. The Succus entericus both of the large and small intestine is destitute of any peptic ferment. It has no action even on fibrin. The Succus entericus of the small intestine contains a diastatic ferment; but this is absent in the secretion of the large intestine. This last has no other function than that of lubricating the lower part of the bowels. The secretion of the small intestine can prevent solutions of gelatine from solidifying; this he thinks is due to the action of a special ferment. When introduced into the large intestine, the following substances are capable of being absorbed: a-b-c peptones, pieces of meat, albuminous substances of milk, dissolved myosin and Lieberkuhnian alkali-albuminate, ordinary albumen of egg mingled with salt, solution of gelatine, and Liebig's extract of meat. On the other hand, pure ovalbumen, solution of syntonin, ser-albumen, undissolved fibrin, syntonin, and myosin are not absorbed.

*Pflüger's Archiv*, Band v. Heft i., contains eight papers:—1. The action of the constant current on the pneumogastric nerve, by F. C. Donders. Chiefly dealing with the electrotonic conditions of the vagus established by currents of various strength. 2. The chemistry of respiration, a dissociation-process; by the same author. 3. The white corpuscles of the blood, and the alterations they undergo from the action of quinine; by G. Kerner; who shows that they are rendered motionless, round, and darkly granulated by this agent. 4. Movements in nerve fibres on excitation, with intermittent electrical currents. In this paper Dr. Th. Engelmann calls attention to certain contractions indi-

cated by wrinklins of the sheath of the nerve, but not accompanied by shortening of its length, if a fibre be removed from an animal and submitted to the action of induction shocks whilst lying in a weak solution of common salt. The current passing on breaking the connection is the most effective. No wrinklins are visible in naked axis cylinders. He attributes the changes observed to the thermic action of the current, and to consequent changes in the succulency (Quellungszustandes) of the sheath. 5. Fick gives the results of a series of experiments he has made during the past summer on the effects of heating and cooling the blood passing to the vasomotor and cardiac nerve centres, and states that to his great surprise he has obtained only negative results, though when such changes were produced in the blood passing to the respiratory centres, very marked effects were observed. 6. The next essay, by the last-named author, is on the function of the peptones in the blood. He regards them as compounds capable of easy disintegration, and as supplying by their non-nitrogenous portions the combustible materials for the muscles and other organs, their nitrogenous constituents being speedily eliminated from the body. 7. Friedrich Schultze gives the results of his analysis of the air contained in the swimming bladder of carp and tench. The smallest amount of oxygen was 1.1 per cent., of carbonic acid 1.4 per cent.; the highest of oxygen 13.2, of carbonic acid 5.4: the rest being nitrogen. 8. The last essay is one by Fr. Goltz, showing that the nerve centres have a direct and immediate influence on the process of absorption.

### Geology.

**The Fossil Plants of the Devonian and Upper Silurian Formations of Canada.**—It has been pointed out by Hall and Dana that during the earlier part of the Upper Silurian period North America was covered by a great internal ocean, partially separated from the Atlantic by a belt of sandbanks or islands, representing the older portions of the Appalachian range, and bounded on the north by Laurentian and in part by Lower Silurian deposits. At the close of the Upper Silurian the area of land in North Eastern America was at a minimum. At the beginning of the Devonian a slow and gradual emergence, unaccompanied by any faults or other physical disturbances, appears to have commenced. Contemporaneously with the very beginning of these changes appeared the Erian (by which is meant the Devonian peculiar to Canada) or Devonian flora. Already, before the close of the Upper Silurian, the first patches of emerging land must have become clothed with Psilophyton, and by the time of the Middle Devonian the flora had, at least on the Atlantic coast, culminated. At the time when the Erian or Devonian flora attained to its greatest extension, there must have been in Canada a considerable extent of Laurentian and Lower Silurian land; and the Erian flora appears to have enjoyed climatic and atmospheric conditions similar to those of the Carboniferous period, but with a smaller continental area and greater proportionate irregularity of surface. At the close of the Devonian period great physical disturbances occurred in the regions lying east of the Appalachians. In the west these disturbances were delayed till after the Carboniferous period had begun, but even in the west the Devonian flora disappears at the beginning of the Carboniferous period. Generically the flora of the Erian is in the main identical with that of the Carboniferous, and the most important and characteristic Carboniferous genera are also among those best represented in the older flora. On the other hand, while some Carboniferous genera have not yet been recognised in the Devonian, the latter possesses some peculiar generic forms of its own, which are especially abundant in the lower part of the system. As examples of such genera may be named Psilophyton, Prototaxites, Leptophleum, and Arthrostigma. Perhaps the most remarkable of all the generic differences of the Carboniferous and Erian flora is the occurrence in the latter of the exogenous genus *Syringoxylon*, a type otherwise altogether unknown in the Palæozoic age. As regards its species the Devonian flora is almost altogether distinct from the Carboniferous. A comparison of the fossil plants of the Devonian rocks of Canada and of Europe is very difficult, since the Devonian formation is limited in Europe to so small an area. It is known that during the Carboniferous epoch the Appalachian range constituted a more important physical barrier than the Atlantic, and that the flora of the Atlantic slope of America was much more closely allied to that of Europe than that of the great internal plain of the American continent. The genus Psilophyton of the Erian of Canada was not found in Europe until 1870, when Dr. T. W. Dawson visited England and recognised (*Rep. Geol. Survey of Canada*, 1871) in several specimens of Devonian rocks from Germany and England the American Psilophyton. On comparing the Erian with other floras, the author concludes that no plants other than Lycopodiaceæ or allied forms have been detected below the Lower Devonian. Should it prove certain that Acrogenous plants allied to Lycopodiaceæ, and perhaps such prototypes of Gymnosperms as Eophyton, extended back to the Primordial period, we might look for the actual origin of land vegetation in the Laurentian. These views respecting a primitive Silurian and Laurentian flora are strengthened by the fact that the plants of the Lower and Middle Devonian

have the aspect of the remains of a decaying flora verging on extinction, while those of the Upper Devonian give us a great number of new forms allied to those of the Carboniferous.

**Congeria Beds in the Rhone Valley.**—C. Mayer discovered a short time ago (*Verhandl. der k. k. geol. Reichsanstalt, Vienna*, No. 15, 1871) beds of yellowish and grey sandy marl near the town of Bollène in the Département de la Drôme, which yielded, besides four species of *Congeria*, four *Cardiæ*, a *Melanopsis*, and the two *Neritinae*, *N. picta* and *N. Grateloupi*. The deposit, which consists almost entirely of these shells, resembles more the character of the Crimean *Cardiæ* beds than the typical *Congeria* beds of Austria and Hungary. The beds rest on a coarse marly sandstone, which may be the marine equivalent of the Cerithium beds of Eastern Europe and the Limnæus beds of Switzerland.

**Cetotherium Remains in Southern Russia.**—These occur here in three horizons (Th. Fuchs, *ibid.*). *C. Raikhei* is found in a compact yellowish-grey limestone, with casts of *Ervilia podolica* (Sarmatian beds). The dolphins of Stavropol are embedded in a loose porous limestone of oolitic character, together with Foraminifera, doubtful casts of a small *Cardium* (*C. obsoletum*), and other fossils. The Foraminifera are the same as those found in the uppermost beds of the Sarmatian deposits, below the *Congeria* beds in the Vienna basin. Other *Cetotherium* species come from a yellow ferruginous sand of the vicinity of the fortress of Anapa, associated with *Cardium carassatellatum*, Desh., *C. edentulatum*, Desh., and *Mytilus (Congeria) rostriformis*, Desh., thus resembling the *Cardiæ* beds of the Crimea. The occurrence of marine Mammalia, not only in the older Sarmatian beds, but also in the brackish *Congeria* strata, is of the highest importance, as it confirms the views, long held, that the *Congeria* beds of Europe assume marine characters, the farther east we travel.

### Chemistry.

**The Diamonds found in Xanthophyllite.**—It was announced in the *Academy* for 1st July, 1871, that v. Jeremejew had met with minute crystals of diamond in great abundance in a microscopic examination of the above-named rock. He recognised their forms, hexakistetrahedra, with somewhat rounded faces. G. Rose (*Ber. Deutsch. Gesell. zu Berlin*, No. 17, 1871, 903) now states that v. Helmersen has succeeded, by treating the xanthophyllite with acids, in isolating the diamonds in the form of a fine powder, which burnt away, leaving no residue, and abraded and rendered dull the smooth and brilliant faces of the hardest minerals, such as corundum. The greenish grey, less transparent varieties of xanthophyllite contain the diamonds in greater abundance than the yellow transparent plates of this rock.

**Ilsemanite.**—In the *Jahrbuch für Mineralogie*, 1871, 566, H. Höfer gives this name to a new mineral occurring in some heavy spar from Bleiberg. Between the crystals of this mineral occurs a bluish-black or black cryptocrystalline mass, which becomes more blue by exposure to the air, is soluble in water, and proves to be molybdate of oxide of molybdenum. On boiling a specimen with water, a dark greenish-blue solution is found, which after the lapse of some hours becomes deep blue, resembling the colour of a solution of sulphate of copper and ammonia. By the evaporation of this liquid and the separation of a quantity of gypsum which is present, a salt is finally obtained which dissolves in water with a magnificent dark blue colour. Ilsemanite appears to be the  $\text{MoO}_3 + 4\text{MoO}_3$  of Berzelius, and it is supposed to be a product of the decomposition of wulfenite.

**Dissociation of Ammonium Carbamate.**—In conducting an experimental enquiry into the phenomena of dissociation, A. Naumann (*Ann. der Chemie*, October, 1871) found the above salt,

adapted to the purposes of this research through the ease with which it is rendered gaseous, and the absence of all corrosive action of the products of its decomposition—carbonic acid and ammonia—on the mercury made use of for the apparatus. He noticed that ammonium carbamate is not volatile without decomposition, being split up, on its taking the gaseous form, into carbonic acid and ammonia. In the case of the products of the decomposition of this body there exists a dissociation tension (usually only attained after some time has elapsed, and greatly delayed under certain circumstances) constant for each temperature as tension of equilibrium where, however varied the conditions may otherwise be, in the same time exactly as many molecules of ammonium carbamate are decomposed as are reproduced from the products of decomposition. The curve of this tension from ammonium carbamate is continuous: as the temperature rises, the increments of tension for equal increase of temperature becoming augmented, as in the tension curves of vapours of solid and liquid bodies. The dissociation and reproduction of ammonium carbamate takes place but slowly, the tension of equilibrium of any given temperature being arrived at only after the lapse of hours or even days, according to the relation borne by the surface of the solid ammonium carbamate to the capacity of the vacuum. The velocities of

dissociation and reproduction diminish the more nearly the actual tension approaches the tension of equilibrium. The velocities of dissociation, under otherwise similar conditions, in which are to be included equal removal from the tension of equilibrium, appear to be greater at higher temperatures than at lower. An explanation of the lengthened times of dissociation and of reproduction of ammonium carbonate may perhaps be to some extent sought in the necessary rearrangement of the atoms during decomposition and reproduction, not however in the solid state of aggregation of the body as such, for the duration of evaporation and condensation of solid bodies is but brief.

**The Meteorites of the Mexican Desert.**—With the object of fixing with greater precision the geographical position of the meteoric masses that have been from time to time met with on the Bolson de Mapini, Dr. J. Lawrence Smith has communicated a paper to the *Am. Jour. Science*, for November, 1871, 335. There were already known the Cohahuila meteorite of 1854 (1), the Cohahuila meteorite of 1868 (2), the Chihuahua iron of 1854 (3), still at the *Hacienda de Concepcion*, and weighing about 4000 pounds, and the Tucson iron (4), found in 1854 on the north of the Rio Grande, and having the form of a ring; this mass weighs from two to three thousand pounds. A fifth mass (5) has since been heard of on the western border of the Mexican Desert, that has received the name of the *San Gregorio meteoric iron*. It measures 6 feet 6 inches in length, is 5 feet 6 inches high, and 4 feet thick at the base; on one part of its surface 1821 has been cut with a chisel. Its weight is calculated to be about five tons. An examination of a fragment showed it to be one of the softer meteoric irons; it has a specific gravity of 7.84, and consists of 95 per cent. of iron and 5 per cent. of nickel, inclusive of a little cobalt. Still more recently news has arrived of the discovery, in the central portion of the desert, of a huge meteorite (6) larger than any yet found in this locality. Dr. Lawrence Smith's paper is illustrated with a little map indicating their relative positions. He believes they are the result of two falls. The Tucson iron has characters that distinguish it from the remaining five. The latter, he considers, fell at an epoch probably far remote, moving from northwest to southwest during their descent: 1 and 2 fell first, 85 miles apart. The distances between the larger masses are,—from 2 to 6, 135 miles; from 6 to 5, 165 miles; and from 5 to 3, about 90 miles.

**The Separation of Magnesia from the Alkalies.**—After an examination of the numerous methods for effecting the separation of these bodies for the purposes of quantitative analysis, T. Scheerer recommends the following process (*Jour. prakt. Chem.*, 1871, No. 10, 476). The liquid containing the chlorides which may contain ammonia salts is to be evaporated nearly to dryness in a platinum dish, then treated with an excess of powdered ammonium oxalate, thoroughly dried and gently ignited. Care is to be taken that the whole of the contents of the vessel is exposed to the high temperature. On boiling the mass with water and passing it through a filter, the magnesia is collected on the paper as insoluble magnesium carbonate, and the potassium and sodium carbonates are to be found in the filtrate. Ammonium oxalate is only converted into ammonium carbonate at a temperature higher than that at which the latter salt volatilises. If therefore ammonium carbonate be employed in the place of ammonium oxalate, the separation does not take place.

**Preparation of Absolute Alcohol.**—Of the many substances that have been used to remove the last traces of water from alcohol, such as potassium carbonate, anhydrous copper sulphate, anhydrous potassium ferrocyanide, caustic lime, caustic baryta, &c., Mendeleeff, after many trials, gave the preference to lime. He states that after drying alcohol of 0.792 specific gravity with an excess of burnt lime for two days, an anhydrous product is obtained. Erlenmeyer (*Ann. der Chem.*, November, 1871, 250), who finds however that those portions of the distillate only which pass over when the operation is advanced halfway are actually free from water, suggests the following modification. He keeps the alcohol in contact with the lime for about half an hour or an hour in the water-bath at the boiling temperature, providing the vessel with a cooling tube that shall carry all the condensed spirit back into the flask. In this way the whole of the distillate is anhydrous. If the alcohol contain more than 5 per cent. of water two or more treatments are necessary.

### Philology.

#### THE PRONUNCIATION OF LATIN.\*

##### VII.

AFTER the Latin pronunciation controversy had slept for six months, it was not without a qualm that I saw it once more reopened in the last number of the *Academy*, and by no less an authority than Prof. Max Müller. It was with real satisfaction, therefore, that I found he has now given his sanction, practical as well as theoretical, to the uniform hard sounding of *c*. As, however, with regard to the much-vexed consonant *u*, which occupies by far the larger part of his article, he is good enough to say that he now leaves the decision with my Oxford colleague and myself, I feel it due to him to show as briefly as I can why I do not acquiesce in his arguments for a *v* sound, but still advocate one much nearer our *w*.

He begins by saying that "the general result of the discussion seems to be that in Latin *v*, as a consonant, must have been as close to the vowel *u* as a consonant can be. So far all parties are agreed." The *w* advocates certainly: but are all parties agreed? He himself admits afterwards that, if a language possesses both the labial and dento-labial *v*, the former would be the nearest approach. An unsophisticated Italian tongue seems incapable of pronouncing the English, or the South-German *w*, or the French *ou* of *oui* or *ouais*; but Italian ears seem now to be, and for more than twelve centuries to have been, most susceptible to the difference in sound between these and their own *v*, finding *gu* to be a much nearer approximation. Whereas the ancient Romans appear without the least misgiving to have in all cases reproduced the German *w* by their own consonant *u*. Why should we suppose their ears less acute than those of their modern descendants? and why, if their *v* was sounded exactly like the modern Romance *v*, could not the old Romans have used some combination of *g* and vowel *u* to express the old German *w*? For, assuming the Latin *v* to have closely resembled the ancient German *w*, it is surely a most striking coincidence that, as Mr. Rhys has shown, the ancient Welsh, having no initial *w*, would appear to have heard in the old Roman *vallum* and *vagina* something very like *gwallum* and *gwagina*.

Such considerations seem to me to go far towards supporting the "hypothesis that, at some time or other, but certainly before the Romans came into permanent contact with their Teutonic neighbours, they changed their old pronunciation of the *v* from the labial to the dento-labial." Now, so far as I can gather, one of Mr. M. Müller's two main arguments for the dento-labial is that such an hypothesis, though not impossible, is extremely artificial. But are not such hypotheses forced upon us by the phenomena of most

\* We are compelled to postpone to our next an important and elaborate paper of Mr. Alexander J. Ellis on the same subject.—ED.

languages with whose history we are acquainted? Unless I quite misapprehend what he tells us of Sanskrit, he deems it most probable, or at least not improbable, that exactly the same thing has happened with its labial breathing; that, once a labial, it has become a dento-labial. A very similar phenomenon, too, is the modern Greek *av* and *af*, *ev* and *ef* pronunciation of the old diphthongs *av* and *ev*.

But it is better to appeal for support to Latin itself: here again, as in so many other respects, the fortunes of *u* would seem to be closely linked with those of its brother, consonant *i*. All of us, I believe, are agreed as to *its* Latin sound; and in the Romance languages it has undergone changes parallel to those of *w* to *v*, though its nature has allowed of a somewhat greater variety, as seen in English *j* or Italian *gi* and *ge*, French *j*, the Spanish aspirate, &c. Nay, even in Greek words, when initial *i* had acquired a consonantal *y* sound, Romance-speaking people have found it necessary to change it, too, systematically, and we have *Jésus*, *Jean*, *Jérôme*, *Gesù*, *Giovanni*, *Girolamo*. Does not the insertion too of this *v* in *Giovanni*, *Genova*, and the vulgar *Pavolo* for *Paolo*, and the like, tell a tale of its own in support of our hypothesis?

His second chief argument he thus states in his last paragraph:—"I cannot help thinking that there is one phonetic peculiarity in certain Latin words which can only be explained if we assign to *v* a dental or dento-labial character. The Latin *in* is changed into *im* if followed by labials. . . . *F* we know was dento-labial in Latin, and therefore we have *infirmus*. The same with *v*, *invictus*. *Com* in Latin is changed to *con* before gutturals and dentals; it remains *com* before labials. . . . Why was it *conviva* like *confido*, but not *conviva* like *combibo*, unless, like *f*, *v* in Latin was pronounced not with the lips alone, but with lips and teeth?" Let me state briefly why this argument too carries with it no conviction to my mind.

It is true that in the best ages *in* often, not always, became *im* before *b*, *p*, and *m*; that *com* generally, by no means always, remained unchanged before these letters; that before consonant *u* *com* generally, not always, became *con*: not always, I say; for in one of the most precious of Latin inscriptions, the letter of the consuls about the Bacchanalia, written B.C. 186 (*C. I. L.* i. 196), we read in l. 13: "neve . . . coniorase neve comvovise neve conspondise neve conpromesise:" here we have *m* before consonant *u*, *n* before *p*; and in the best times *combibo*, *compleo*, *conminuo* might always be used. But I can admit of no analogy whatever in classical times between *f* and consonant *u*: there was an absolute incompatibility between *f* on the one hand and either *ph* (*φ*) or consonant *u* on the other; and the fact that Latin *f* and *ph* finally coalesced in the Romance *f* is proof of a change as great and systematic as that of *w* to *v*.

But we know from many quarters, from Cicero and Quintilian, that there was a strong affinity between *s* and *f*; and I have always believed that the same phonetic laws which constrained the Latins to say *conspiro* compelled them also to say *confido*. If, then, we are to seek for some such analogy, since it is allowed on all hands that there was a strong affinity between the guttural *g* and consonant *u*, I should be disposed to believe that they preferred *conviva* to *comviva*, because they always said *congero*, *concurro*, not because they said *conduro*, *contero*.

But here, too, I would much rather appeal to that never-failing analogy between *u* and *i*. They were semi-vowels, and their vowel nature was ever present to the minds of the ancients. *In* was always unchanged before all vowels alike; it was also unchanged before consonants *u* and *i*. *Com* and *con* were perplexing: at first they would seem to have acquiesced in *com*, as in the archaic *comvovise* and *comvalem*, perhaps for the same reasons that we find *comes*,

*comedo*, *comitia*. Next, in the case of both *u* and *i* we find *co*, as is usual before vowels: *coventionid* (= *contione*), *covenimus*, and *coicere*, *coingi*. Finally, they seem to have acquiesced in *con* before consonant *u* and *i* alike.

Doubtless all advocates of *w* will be "quite willing to admit that they only stand up for a pure labial breathing, not for the exact English *w*." Let it be English, or South German *w*, or the French *ou* of *oui*; only not English or Romance *v*. The English *w*, as phonologists say, may be peculiar to the English; but when Mr. Max Müller observes, "though I have lived in England for a quarter of a century, I still am unable, as the best phonologists tell me, to pronounce the pure English *w*," he will not have forgotten that a few weeks ago the untutored ears of half a dozen of the best philologists in Oxford were unable to perceive the slightest difference between his English *w* and their own. Gladly, then, will I, for one, accept as a compromise his version of English *w* for the sound of consonant *u*.

H. A. J. MUNRO.

**An-Nadim's Index of Arabic Literature.** [*Kutub al-Fihrist*, mit Anmerkungen herausgeg. von Gustav Flügel. Nach dessen Tode besorgt von Joh. Roediger und Aug. Müller. Zwei Bände. Mit Unterstützung der Deutschen Morgenl. Gesellschaft. Erster Band: den Text enthaltend.] Leipzig: Vogel.

A WORK of the greatest importance for literary history appeared towards the end of the tenth century A.D. under the modest title *al-Fihrist* or *The Index*. It was from the pen of *Ibn Abi Ya'kub an-Nadim*, and consisted mainly of a bibliographical description of Arabic literature with short biographical notices. The first four centuries of the Hijra were much more fruitful in most departments of this literature than those which followed, and the works produced had a proportionate degree of importance. Our author, living in the centre of the literary movement, unrolls to us, chiefly by a simple enumeration of the titles of books, the picture of an activity on a large scale. It is enough to refer to the comprehensive works of Arabic philologists (using the word in its largest sense), on which this work gives us accurate information. And we infer from an-Nadim that the activity of Arabic *savants* was not less marked in other departments. The works of this period which are still preserved form but a small part of what was once extant, and a melancholy feeling often comes over us in reading this book, as if we were walking over a field of ruins. It is true that many, or rather most, of the works enumerated in the *Fihrist* can hardly be regretted. What better lot could befall most of the innumerable poems of those centuries than that their loss should make it impossible for us fully to estimate their worthlessness! And then we must remember that but few persons in the East have themselves thought and observed, and that by far the greater number of Arabic works are compilations and epitomes; this was already the case in the time of an-Nadim, and the very want of originality on the part of later authors was the means of preserving the principal contents of lost works. And yet, in spite of this, there were sources of valuable information without number among the books which an-Nadim still had before him, and which are now lost. This is especially true of the historical works. Many of the works, for instance, of Ibn-al-Kalbi, uncritical as he may have been, would have possessed the greatest value for us; I need only mention his book on Hira, its Christian inhabitants, and their churches and convents (p. 97, l. 12 sq.). And thus at every step we find in the *Fihrist* the titles of works which we cannot but deeply regret to have lost.

I have already indicated that an-Nadim is not so much a historian of literature, strictly speaking, as a bibliographer.

This appears particularly in his treatment of the poets. He mentions the philologists who collected the works of the several ancient poets, or groups of poets, and states the extent of the works of later poets, but leaves us in utter ignorance of their respective peculiarities; to describe these did not enter into his plan.

It is one great merit of the author that he does not confine himself to scientific and elegant works, but refers as much as possible to the popular literature as well. We get a glimpse of stories like the *Thousand and One Nights* (a work which he confesses that he fails to relish, p. 304), and of a strange medley of magic, jugglery, erotica, &c.

Besides the proper Arabic literature an-Nadīm takes note of everything which was translated into Arabic. We thus obtain some very valuable notices as to the earlier Persian literature, and even on Indian works, though the deformation of the titles and names of the authors makes the latter very enigmatical. He dilates particularly on the works translated from the Greek, and though his notices on Greek philosophers and others will scarcely yield any fresh information on the writers themselves, they may at least illustrate the propagation of literary legends and traditions. At any rate a careful monograph on the chapters containing them cannot fail to be of use to the classical philologist. Among the translated works we find very valuable by the side of utterly worthless matter—e.g. by the side of Aristotle and Plato the work "On Rivers," which is represented as proceeding from "another Plutarch" (p. 254, l. 17 sq.). The author is careful to give the names and the method of procedure of the several translators. On one occasion he mentions from his own knowledge that some chests were found in Ispāhān, containing papers which were declared by experts in Baghdad to be Greek army-lists (p. 241). These seem to have belonged to the time of the Seleucidæ.

As a copyist by profession, an-Nadīm takes great interest in all kinds of writing. Thus he opens his work with a very interesting section on the language and writing of various nations. What he there says of the various kinds of Arabic writing would be much more important if a larger number of good specimens of them were extant. The negligence of the copyists has pretty well deprived us of the benefit we must have derived from transcription of foreign alphabets. When we are already acquainted with an alphabet, e.g. the Hebrew (p. 15), we can still detect the several letters under their distorted forms, but only in such cases. Hence I have unluckily failed in unriddling the Manichæan alphabet, in which we doubtless have to seek one of the many varieties of the Aramaic writing. I do not even venture to assert positively that the apparent similarity of the six letters on the lowest line (Ṣād, Mīm, Hā, Kēf, Qāf, Hē, the Arabic names of which are written out at length between the letters) to the corresponding Mandæan ones is reliable. But there is much important matter on other subjects in these chapters; see, for example, the passages on the so-called Huzwāresh (*Zu-wārishn*, p. 14, l. 13), and on the varieties of Syrian writing, where the first mention known to me of the name *Estrangēlā* occurs (p. 12, l. 12). Several of an-Nadīm's statements on the Aramaic language are given on the authority of "the commentator" Theodore (of Mopsuestia) (pp. 12, 14), so that he must have derived this information from Nestorian sources. In fact, most of the Syrians who had intercourse with learned men in Baghdad seem to have been Nestorians. Thus, too, the canon of the Scriptures in the *Fihrist* (p. 23 sq.) is the Nestorian, though it is true that the titles of some books have fallen out of the list by mistake. An-Nadīm had also literary relations with the Jews. From this source he gives us a catalogue of the works of Sa'dia (p. 23).

The cultivated Arab world was at that time tolerably free

from fanaticism; and the theological liberality of our author is proved by his whole work, but especially by his excellent notices on the various religious parties, which, strictly speaking, do not fit into the *cadre* of the work, though perhaps they form its most valuable part. Not only does the book supply accurate information on semi-pagan sects like the Ismaelites, &c. (which nevertheless stand in a rather close relation with Mohammedanism), but also on such as stand in direct opposition to the weightiest principles of Islam. The most valuable of these notices, viz. on the heathen in Harrân, and on the Manichæans, had already been published from the *Fihrist*, the former by Chwolsohn, the latter by Flügel. Besides this, we learn from the *Fihrist* that there still existed a number of Gnostic sects, the mere remnants of widely spread religious parties, and doubtless already much altered from their original form. The only sect which has survived to this day are the Mandæans.

The *Fihrist* is better arranged than is usual with Arabic writers, and even though there is much in the division of the matter which may surprise us, it is not at all impossible to find one's way to some extent in the book. But the use of this so-called Index, composed, as it is, of groups of subjects, will be greatly facilitated by the expected alphabetical index.

An-Nadīm goes very carefully to work. He is in the habit of naming his authorities, but prefers, wherever he can, to derive his *data* from ocular evidence. Being a learned copyist and bookseller, he gained access to many works in all kinds of literature, besides which he was a lover of literary *curiosa*. He draws a vivid picture (p. 40 sq.) of an old collector of books and autographs, who once allowed him to inspect his treasures, which at other times he guarded as jealously as a miser, and which were destroyed after his death, no doubt in accordance with his wishes. It is interesting to know that the collector was afraid of the Hamdānids. That princely house was well known for its attachment to literature, and might not be disinclined to add such rarities to their own collection.

An-Nadīm's style is enough to show that he was not a professional scholar. It is certainly surprising that one so well acquainted with literature should commit so many offences against Arabic grammar. For example, he uses *siyamā* without *lā*, and even says *awwalah*, "prima," for *ūlā*. The editors have, therefore, done wisely in not correcting the numerous grammatical errors, even though there can be no doubt that their number has been increased by the copyists. Besides, these errors are more owing to a certain negligence than to ignorance, for the author shows in some places that he is able to form an opinion on purity and impurity of style.

According to his own statement several times repeated, the *Fihrist* was written in the year 377 of the Hijra (beginning May 3, A.D. 987). The collection of materials must naturally go back into a much earlier time. The MSS. however present many vacant spaces, the greater part of which are due to the author himself, who was desirous of filling these up gradually by inserting the number of the year, &c., but could not carry this into effect. We may therefore readily admit to Flügel that the author worked at his book from time to time even after that date. But it is equally clear that at least a few additions have been made by another hand. Cases like that in p. 146, l. 4, "it comes on the next leaf, the author has ordered it to be so," speak for themselves; and it seems highly improbable that, after the words, "He survives to the year 377," an-Nadīm himself should have added, "He died in the year 378" (p. 132, l. 7, sqq.); for in that case he would certainly have crossed out the former passage. But at any rate the additions by another hand are not very numerous.

Dr. Flügel had been occupied for many years with an edition of the *Fihrist*. Indeed, as the editor of *Hâjî Khaḥḥa*, he must have felt specially called to bring out this great work; yet, alas! it was only vouchsafed to him to see the first sheets of it in print. After his death, Dr. J. Roediger, a son of the celebrated Orientalist, undertook the continuation of the work, with Flügel's materials, assisted by the counsel of Fleischer. The MSS. are very defective; not one of them is complete, and some portions of the text exist only in a single codex. In addition to this, all the MSS. abound in errors, and many diacritical points are everywhere wanting or misplaced. It should be recognised that the editor has done all that can be fairly expected from an *editor princeps*, and we may hope that in course of time the manuscript material may be augmented. At any rate it will be necessary for several reasons to work through the several sections in the style of a monograph, and this will gradually tend to the improvement of the text, so that a new edition after the lapse of thirty or fifty years will certainly be able to show important corrections. I may allow myself to take the opportunity of indicating some few unimportant corrections, suggested by the perusal of the work. P. 24, l. 1, read *Hazza* (near Arbela), well known to have been an ancient metropolitan see. P. 43, l. 3 *sq.*, the letters R and Z should evidently change places. P. 91, l. 26, *Yasida 'bni* should be inserted before '*Abdi 'maliki*, for the narrative does not suit Walîd I., in whose time the empire of the Omayyades stood at the summit of its power, but to the dissolute Walîd II.; cf. de Goeje and de Jong, *Fragm. histor. arab.* i. 127. The year of the death of the grammarian Al-Kisâi is given differently in three places, p. 30, l. 1; p. 65, l. 29; p. 204, l. 1. The year 189 mentioned in the last passage is alone correct. For though it is of course possible, it is not very probable, that an-Nadîm himself made a mistake twice over. P. 354, l. 19, we ought certainly to read *Serjîs*; it is the well-known Syriac translator Sergius of Rêsh 'ainâ. P. 111, *ult.*, I should read, not *wallaumu*, but *wallômu*; the "blame" might clearly be unjustified, and in that case would not hurt long, but an "abject disposition" is indestructible.

Dr. Roediger himself recognises it as a defect that the variants are placed, not under, but after the text. Of course, he could not alter the arrangement, as it had been adopted in the sheets edited by Flügel. I am rather disposed to think that the really existing variants are not fully entered in the list; in a work of this kind it is desirable to exhibit the readings as completely as possible. And I cannot help considering it a strange want of consideration for the reader that no variants at all are given for perhaps the most important passage in the whole book, that relating to Mani and the Manichæans, and a mere reference made to Flügel's book on this passage. We most urgently beg the editor to make good this omission in the second volume, for it is surely too much to expect that every reader who wishes to use that section should procure Flügel's book, when he actually has the best part of its contents in his hands. I could have wished too that Dr. Roediger had not thought it a duty to print Flügel's posthumous preface without even the least change of expression. A passage like this, "Und würde von entschiedenem Nutzen sein, wäre es nur irgendwie brauchbar" (p. xvii, above), would certainly have been altered by Flügel himself.

The preparation of the notes and an index has been undertaken by Dr. Müller. These will form the second volume, which is to appear in the spring. If I might add one more criticism, it would be this, that the book is too dear, at any rate from a German point of view. As the German Oriental Society has borne a considerable share of the expenses, the publisher might surely have affixed a much lower

price. At the same time I cordially admit that the getting-up of the book is excellent. And before parting from the work, I sincerely congratulate Dr. Roediger that he has presented so invaluable a gift to Oriental learning.

TH. NÖLDEKE.

### THE DERIVATION OF "BARK."

#### TO THE EDITOR OF THE ACADEMY.

SIR,—The origin of our verb *bark* has long been a disputed point, English etymologists regarding the word as imitative of the sound it denotes, while German philology has nothing more to offer than the comparison with the Old Norse *barki* (throat). Both views are unsatisfactory, and I have a simpler explanation to propose, which will obviate the unpleasant necessity of adopting the imitation theory, and will not take us off English ground.

Bearing in mind the frequent shifting of *r* in Old English, and its modification of preceding *e* into *æ*, the following series of changes will offer no difficulty:—*brecan*, *bercan*, *bgoran*; in short, *beorcan* is nothing else but a variation of *brecan*: *break* and *bark* are the same words.

The change of meaning is well illustrated by the Latin *fragor* compared with *frango*. So, also, in Old English, *gebræc* is used exclusively in reference to sound; and in one passage of Cynewulf's *Crist* (Grein, l. 951) *brecan* itself is employed most unmistakably in the sense of "fremere"—he is describing the Day of Doom:—

"on seofon healfa swôgað windas  
blāwað breccende bearrhta mæste."

Grein erroneously separates the word in this sense from the other examples of *brecan* = *frango*, comparing the Old Norse *braka*, which would postulate an Old English *bracian* with present participle *bracigende*.

From the roaring of the wind to the growling and barking of a dog is a short if not a very dignified step.

HENRY SWEET.

P.S.—I have just heard from Mr. Skeat that he has arrived independently at the same conclusion as I have about the original identity of *beorcan* and *brecan*, a fact which considerably strengthens the theory.

### Intelligence and Notes.

Under the title *Sprache und Sprachen Assyriens*, Dr. F. Hitzig has published his long-promised investigation of the language of Assyria and Babylonia, which he takes to be a hybrid tongue, Sanskrit in the main, but containing Turkish, Egyptian, and even Semitic elements. This result is obtained from an enquiry (occupying 70 pages) into the Assyrian and Babylonian proper names preserved in Greek and Hebrew authors. The names of Nineveh and Babylon are pure Sanskrit; the first means "the fish-formed," the second, "city of the sun"! Assyria, on the other hand, is pure Turkish, and means "the country beyond;" Euphrates, half Turkish, half Hebrew, and means "the overstepping water"! Belus is doubtfully, Nebo confidently, derived from the Sanskrit, *Mylitta* from the Semitic! A law which is assumed to govern the conversion of sounds in Perso-Median and Hebrew is founded on the pretended identity of the Nod of Gen. iv. 16, and Mâda=Media (p. 15), and the same law is immediately afterwards (p. 21) used to establish the convertibility of *M* and *N* in Sanskrit and Assyrian! Vocal changes supposed to take place in the two latter languages are gravely illustrated by those which occur in Turkish! As to the Assyrian characters, the author's theory is that they are exclusively phonetic, even if, as Assyriologists affirm, polyphonous, but in no case strictly ideographic. We are astonished, however, to learn from Dr. Hitzig himself that he has only analyzed three lines of an Assyrian text, a rather slender basis for such positive opinions. It would be well in future not to discuss the Assyrian inscriptions in public till he has acquired a somewhat more thorough knowledge of the cuneiform character. He interprets the name commonly spelt Sennacherib, "captain of the host" (p. 78), reading the ideographic signs phonetically, as *Aniskurekit*, which name he composes of Arabic (!) *سنة*, "army," and Sanskrit (!) *x'it*, "commander." Unfortunately the last syllable must be read not *kit* but *su* (D). Dr. Hitzig has simply confounded the two rather similar signs! Further comment is superfluous.

M. Schwab has brought out the first part of a "translation of the Talmud," under the title of *Traité des Berakboth, ou première partie du Talmud de Jérusalem et du Talmud de Babylone* (Maisonnette). We are unable at present to state how far the ambitious programme of the translator has been realised.

M. Constantine N. Sathas is at present at Venice superintending the printing of his new work in three volumes, which will be entitled *Μεσαιωνική Βιβλιοθήκη*. It will contain a series of inedited chronicles and historical documents concerning the Byzantine empire, the French and Italian principalities and dukedoms in Greece, and the earlier times of the Turkish dominion. The first volume embraces treatises by Michael Attaliata, Nicetas Choniates, and Theodore Metochita; the second is more especially devoted to the mediæval kingdom of Cyprus, and the third contains the compositions relating to the Turkish period. The whole work will consist of about 100 sheets, and will probably be the most important contribution to the history of mediæval Greece that has appeared since the publication of the Bonn *Corpus Scriptorum Historiæ Byzantinæ*.

M. Émile Legrand, whose collection of early compositions in modern Greek we noticed in a preceding number (vol. i. pp. 245, 246), is still busy in adding new reprints to his series. We regret that for some reason or other his publications do not always reach us, but are glad to observe that in his edition of the paraenetic poem of Stephanos Sachlekes, which has just reached us, and which is, by the way, the first edition of this extremely curious work, the editor has taken our advice in adding explanatory notes on the more difficult and antiquated words; and from one of his notes we learn that in a second edition of the *Βασικοπούλα* (Paris, 1870, Imprimerie nationale), which we have never seen, the editor has also added annotations. Some of the notes in the present volume betray, however, a somewhat shaky knowledge of the laws of word-formation: e.g. v. 99, *συναντῶνται* is said to be derived from the root *συνάπτω*, and besides this, M. Legrand ought to have remembered that *συναντῶμαι* is very good ancient Greek.

Messrs. Bell and Daldy are just about to publish an edition of the *Trinummus* of Plautus with English notes by Dr. Wilhelm Wagner, whose edition of the *Aulularia* (five years ago) was very favourably received by English scholars, and has since become a text-book at Eton and other public schools.

In the *Transactions of the Berlin Academy of Sciences* (Oct. 16) Prof. Jacob Bernays publishes a short essay on the dialogue entitled "Asclepius," printed in our editions of Apuleius. That the dialogue is an indifferent translation of a Greek original, and in no sense the work of a master of style like Apuleius, is pretty certain; but it is not equally clear whether we are to assign the original to the beginning of the Byzantine period or to some earlier date. The result, however, of this model of delicate and finished criticism which Prof. Bernays now gives us is (1) that we may set aside sundry passages (in cc. 24-26) as interpolations due to the time when the Christians had become in their turn persecutors; and (2) that there is nothing in the rest of the dialogue which may not be attributed to some Neoplatonic adherent of Polytheism living at the commencement of the third century A.D.

Among the forthcoming books announced by Messrs. Teubner are a second and enlarged edition of Teuffel's *Roman Literature*; an *Historical Syntax of the Latin Language*, by Dr. A. Dräger; a new critical edition of Cicero's *Letters*, by A. S. Wesenberg; a selection of the miscellaneous writings of the late Friedrich Haase of Breslau; and *Studien zur Geschichte der griechischen Lehre vom Staat*, by Dr. H. Henkel.

A continuation of Engelmann's well-known *Bibliotheca Scriptorum Classicorum* is an acknowledged desideratum among scholars, but Herr C. H. Herrmann of Halle, who undertakes to supply the want by a catalogue of recent publications (from 1858 to 1869), seems to have brought little more than good intentions as qualifications for the task. In a review of the book in the new number of the *Philologischer Anzeiger*, our esteemed contributor, Dr. Martin Hertz, points out a number of errors which would certainly cause most serious inconvenience to any English student who took the work as a guide to the modern literature of philology.

We understand that the proprietors of Ellendt's *Lexicon Sophocleum* have instituted a "Nachdruckprocess" against the firm of Teubner, as publishers of the similar work by Prof. W. Dindorf.

### Contents of the Journals.

*Zeitschrift für die österreichischen Gymnasien*, xxii. pt. 9.—M. Petschenig emends certain passages in the Scholia to Horace, and shows incidentally that Hauthal's edition leaves much to be desired.—J. Oberdick gives us some Notes on Aeschylus, principally on the use of resolved feet in iambic lines. The article is a careful *résumé* of the facts, but the results of the enquiry do not strike us as new, and some of the textual changes suggested—for instance, that in *Sept. c. Theb.* 576, *καὶ τὸν σὸν ἀδελφὸν αὐτῷ ἀδελφὸν πρὸς μῦθον*—can hardly be deemed improvements.—Dr. K. Schenkl reviews Jordan's essay "de suasoriis ad Caesarem Senem de re publica inscriptis," very favourably, maintaining, however, against Jordan—(1) that these suasoriae are earlier than Quintilian's time; and (2) that they are not the work of one and the same writer.

*Journal Asiatique*, No. 64.—Grammaire pâlie de Kaccâyana, sùtras et commentaire, publié avec traduction et notes; suite. (M. E. Senart.) [See *Academy*, vol. ii. p. 468.]—Réclamation de M. Stan. Julien.

*Centralblatt*, Dec. 16.—Ahlwardt's Catalogue of Arabic MSS. at Berlin (poetry, belles-lettres, literary history, philosophy), rev. by Th. N.

### New Publications.

AHLWARDT, W. Verzeichniss arabischer Handschriften der Bibliothek zu Berlin. Greifswald: Bamberg.

BOCK, Dr. Conr. De Baccharum Euripidae prologo et parodo. Commentatio philologica. Particula prior. Colberg. (Belgard: Post.)

BRACHET, A. Dictionnaire des doublets. Paris: Lib. Franck.

CICERONIS, M. Tullii, de officiis ad. Marcum filium libri tres. Erklärt v. Otto Heine. 4. verb. Aufl. Berlin: Weidmann.

CLASON, Octav. De Taciti annalium aetate quaestiones geographicae ad mare rubrum et Aegyptum maxime pertinentes. Rostock: Kuhn.

CORNELII NEPOTIS vitae excellentium imperatorum. Mit e. Wörterbuche zum Schulgebrauch v. Gymn.-Oberlehr. R. M. Horstig. 4. verb. Aufl. hrg. v. Dr. Fr. Aug. Eckstein. Leipzig: Reichenbach.

DE ROSNY, Léon. Anthologie japonaise, poésies anciennes et modernes des insulaires du Nippon, trad. en français et publ. avec le texte original. Avec une préface par E. Laboulaye. Paris: Maisonneuve.

VIGFUSSON, G. Cleasby's Icelandic English Dictionary: enlarged and completed. Part II. Oxford: Clarendon Press.

WEDGWOOD, H. Dictionary of English Etymology. 2nd ed. Thoroughly revised and corrected by the author, and extended to the classical roots of the language. With an introduction on the formation of language. [Five Monthly Parts, December to April.] Parts I. and II. Trübner.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 40.

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.

The next number will be published on Thursday, February 1, and advertisements should be sent in by January 27.

The Second Volume (October 1870 to December 1871) is now ready, bound in cloth, price 15s. Covers may be had of the Publishers, price 2s.

## Literature.

## NORSE MYTHOLOGY.

**La Fascination de Gylfi** (Gylfa ginning). Traité de Mythologie Scandinave, composé par Snorri, fils de Sturla, traduit du texte norrois en français et expliqué dans une introduction et un commentaire critique perpétuel par Frédéric-Guillaume Bergmann. Deuxième édition, augmentée de notes additionnelles et d'un répertoire général alphabétique. Strasbourg et Paris : Treuttel et Würtz.

**Le Message de Skirnir** et les Dits de Grimnir (Skirnir-Grimnismál). Poèmes tirés de l'Edda de Saemund, publiés avec des notes philologiques, une traduction et un commentaire perpétuel par F.-G. Bergmann, ex-doyen de la Faculté des Lettres de Strasbourg. Strasbourg et Paris : Veuve Berger-Levrault et Fils.

**Die Edda**, die ältere und jüngere, nebst den mythischen Erzählungen der Skalda übersetzt und mit Erläuterungen begleitet von Karl Simrock. Vierte, vermehrte u. verbesserte Aufl. Stuttgart : Cotta.

THE general knowledge of the subject and character of the *Edda* possessed by all educated persons seldom extends to a direct and familiar acquaintance with the two works which bear that name; this, at least, is the case in England and France, and if the remark applies in a less degree to Germany, this is chiefly owing to Simrock's successful exertions in the work which has just reached its fourth edition. I say successful, for Bergmann's labours were much less fortunate, in spite of his indefatigable zeal, in spreading a knowledge of Northern antiquities in France, though his first attempt in that direction was made as long ago as 1838 (*Poèmes islandais*, &c.). There are several ways of explaining his want of success: the old Norse poetry and mythology does not appeal so closely to the French mind and taste as to the German, or rather the Teutonic. The national interest in the subject is also wanting which enabled Simrock to begin his introduction with the words: "That the gods of the North were ours also has long been certain; the brother stocks, German and Norse, had in all essentials a common belief as well as common speech, laws, and customs; Odhin is Wuotan, Thor, Donar; Asen and Ansen, Alfén and Elfen, Sigurd and Siegfried, are only other forms of the same mythical names." Finally, the extent and thoroughness of Bergmann's erudition has probably had a deterrent effect upon the majority of readers, and caused his works to make their way but slowly, as in the case of the *Fascination de Gylfi*, which has been ten years in reaching a second edition. He is anxious to trace every peculiarity home to its origin, and to make every difficulty so clear to his own mind that, where reliable evidence is wanting, he takes refuge in conjectures, in the course of which the phrases "sans doute" and "probablement" occur much

VOL. III.—NO. 40.

too frequently, and substitutes, with a daring worthy of Niebuhr, his unsupported hypotheses for established facts. He is as much at home with the language and antiquities of the Pelasgi, the Scyths, and the Getae as with that of the ancient Scandinavians; and the general reader, at least in France, does not care to follow his minute explanations of every detail in so wide-reaching a plan. To the, alas! small class of more conscientious students, Bergmann's works may be warmly recommended.

The first of the works before us contains, to begin with, a summary survey of the rise and development of religions and mythologies in general, and then a circumstantial account of the Norse mythology and its history, of the customs and usages therewith related, and of the sources from whence our knowledge of it is derived—that is to say, the so-called *Elder* and *Younger Edda*. *Edda* means properly "Great-grandmother," and, according to Bergmann, the collection known as the *Younger Edda* received the name from the Skald Olaf (d. 1259) who applied it in the sense of "annosa narratrix," because *Gylfa ginning*, which stands at the head of the collection, relates the old Northern myths. Bergmann gives a full account of all the literary works of Snorri Sturluson (d. 1241), the author of this portion and of the *Bragarœdur*, and of the methods and aim kept in view by him; and he takes occasion, by the way, to convey information on a variety of subjects which would scarcely be looked for in such a place—as, for instance, the literary contests of early times, of which the *Wartburgkrieg*, so well known in German literary history, was one; the origin of the narrative framework to groups of tales used by Boccaccio and Chaucer; the titles of books amongst the ancients, in the East and in the middle ages; the glacial period; the distinction between the expressions "scientifique" and "littéraire;" the etymology of the Mediæval Latin *sunnis*, &c. &c. All these things are interesting and instructive, and though the remark "sed nunc non erat his locus" might suggest itself, they are really a symptom of his desire to exhaust every topic which is related, however remotely, to his principal theme. Thus he shows that "Great-grandmother," though it may seem a strange name for a mythological treatise, is well grounded, and has parallels in every literature; the foundation of the *Gylfa ginning* is a literary contest, which at the same time serves as a framework; then there is an obvious reference to the glacial period in one part of the Norse cosmogony and theogony; the author argues that Snorri's intention and method was "scientific" rather than "literary;" and, finally, the name of the goddess *Syn* is connected etymologically with *sunnis*, and this again with two quite distinct families of words, &c. &c. In the etymology and interpretation of the names of persons and localities, Bergmann has done his uttermost for the reader's instruction, and as he generally gives the grounds on which they are based, it becomes possible to attach an idea to every name. At the same time, there are serious objections to his practice of always making use of the equivalent he has invented for each proper name. It is tiresome to have to read always *Endomitojen* for *Midgardr*, *Troupiers-uniques* for *Einheriar*, *Halle des Occis* for *Valhöll* (Valhalla), *Loki de l'Endos-extérieur* for *Utgard-loki*, *Mœunier* for *Mjöltnir*, *Large-Éclat* for *Breidablick*, &c. &c. A better plan would have been to retain the old names, and give their meanings in a separate alphabetical table. A serious reader need not, however, be discouraged by these peculiarities from availing himself of the author's varied stores of learning. Besides the subjects already alluded to, there is a particularly good explanation of the origin of the custom of swearing brotherhood in arms under a strip of turf (p. 351), and of the reason why

the gods begin again after the renewal of the world to play at the same game as they had played before when they were young.

Some of Bergmann's explanations differ from the common traditional ones. According to him the god Thor generally goes on foot, because in the seventh century A.D., when the Scandinavian population began to be divided into peasants and nobles, Thor became the patron of the former, and followed their custom in this respect, whilst Odin, the god of the warlike aristocracy, seldom appears except riding on his steed Sleipnir. Again, the ordinary view of Freyja's car drawn by cats is that the cats refer to her position as goddess of love, as the corresponding Egyptian goddess Bubastis is represented with a cat's head. Bergmann on the contrary thinks that the cat, a domestic animal whose favourite resting-place is on the hearth, belongs to Freyja as the household goddess, whose name in fact means ruler or mistress in the sense of a wife or mother of a family. The points on which he differs from his predecessors are too many for enumeration, and I will only add that, while constantly referring to the religion of the ancient Getae and Scyths (according to him the fathers and grandfathers of the Scandinavians) as he conceives it to have existed, he pays no attention to other religions excepting those of the Slavonians and Indians, both of which have, according to Bergmann, features in common with the Norse mythology. Here we may take leave of Bergmann's *Gylfa ginning*, which, together with *Bragarœdur*, forms, as we have observed, the chief part of the *Younger Edda* of Snorri Sturluson. The remainder, consisting of a Norse *Ars Poetica*, was added after Snorri's death (1241), and the whole collection, in Bergmann's opinion, first received the name of *Edda* after the middle of the thirteenth century. This *Younger Edda* is in prose, whereas the so-called *Elder Edda* contains a collection of mythological and epic songs, of which some may have been in existence before the time of Snorri and known to him, though the work did not take its present shape till the beginning of the fourteenth century according to Bergmann (the middle of the thirteenth according to other authorities), and was not called *Edda* and ascribed to Saemund the Wise (*d.* 1133) until the sixteenth century. On this point, however, Bergmann is at variance with himself, for in the *Fascination*, p. 41, he says: "Le nom de *Edda* était inconnu à Saemund et à Snorri; le premier n'a jamais composé le Recueil de poèmes qu'on lui attribue et qu'on appelle aujourd'hui l'*Edda de Saemund*; le second n'a jamais eu entre les mains un tel recueil, composé par Saemund." Yet in his other work, *Le Message de Skirnir*, he speaks of the "homme érudit (probablement Saemund le savant) qui à la fin du onzième siècle a formé et composé par écrit la collection des chants appelés poèmes de l'*Edda de Saemund*." In both these passages Bergmann gives a reference to an earlier work, *Les Chants de Sól (Solar Lið)*, poème tiré de l'*Edda de Saemund*, publié avec une traduction et un commentaire, Strasbourg et Paris, 1858, p. 18, where he says: "Quant à la formation du recueil de l'*Edda de Saemund*, de fortes raisons nous empêchent de l'attribuer à Saemund." It would therefore seem that the passage in *Le Message de Skirnir* is a slip of the pen or the memory; but in the *Chants de Sól* Bergmann adduces arguments, which I am inclined to regard as conclusive, to prove that Saemund was really the author of the *Solar Lið*, and Simrock agrees with him so far as to admit that this is probable. It is to be regretted that the date of the other songs in the *Elder Edda* cannot be determined with the same precision; but unfortunately with the exception of *Skirniför* and *Grimnismål* (for which see below) this is far from being the case, though we must suppose at least a portion of

the poems, especially the mythological ones, to stretch back into the period of heathenism. Bergmann usually gives the reasons which have determined him in his choice of dates, so that in these questions the reader is always enabled to form an independent judgment. When he omits this precaution, his views have less chance of acceptance, as for instance when he says that in about the third century B.C. the Scandinavians invented new divinities who were no longer zoomorphic but anthropomorphic (*Fascin. de Gul.* p. 201; cf. p. 219); that the Sviones and Gauts, Getic tribes, settled in Scandinavia in the fourth century B.C. (p. 263); that in the sixth century B.C. Targitavus, the anthropomorphic sun-god of the Scythians, was looked upon as the protector of the family and the nation (p. 265), &c.

The second of the works before us takes its subject from the *Elder Edda*, and is in some sense a continuation of the one which first made Bergmann favourably known in the learned world, namely, *Les Poèmes islandais (Voluspa, Vafthrudnismal, Lokasenna)*, tirés de l'*Edda de Saemund* et publiés avec une traduction, des notes et un glossaire par F.-G. Bergmann, Paris, 1838. Since then considerable progress has been made in investigations of this kind, the results of which have been utilised in the *Message de Skirnir*, &c.; and the introductions and commentary supply a compressed summary of the author's previous researches into Northern mythology, for which the nature of the two poems gives a suitable opportunity. The translation is in prose, and like that of *Gylfa ginning*, word for word, so that any one desirous of studying the language of the ancient North apart from its mythology will find it a useful assistant. I will only mention two passages in the introduction to *Skirniför*, which are of comparative general interest. Bergmann derives the German name for February, *Hornung*, from *horn*, which, he thinks, in German idiom, means hard ice (Old Icelandic *hiarn*, frozen snow), so that January, when the frosts are most severe, would be called the *great horn*, and February the *little* or *younger horn*. The Greek ἦρος, "hero," as well as the Latin *verres*, he derives from the Sanskrit *varahās*, "boar," because the warlike nature of this animal makes his name a suitable designation for a famous warrior; he does not, as he might, quote the example of William de la Mark, the famous *Sanglier des Ardennes*, in support of his suggestion. From the introduction to *Grimnismål*, I will only quote Bergmann's division of the mythological poems of the North into three distinct periods, of which the first extends approximately from the fourth to the seventh century A.D., and bears a lyric-epic character. The poet, who was always anonymous, generally gave a short prose introduction before plunging *medias in res*. The second period, which reached into the eighth century, produced no new myths, as the Scandinavian mythology had attained its highest point in the seventh century, but it preserved those already existing, and handed them down both in writing and tradition. The character and form of these still anonymous poems is dramatic-didactic, that is to say, dialogue alternates with narrative; and there is a didactic or literary purpose which demands a poetical framework in addition to the prose introduction. In the third period, which begins in the eighth century, political and religious changes took place which modified the character of the poetry, and introduced Scalds of known name, who only made use of the heathen mythology occasionally, and for purposes of illustration. *Skirniför* and *Grimnismål* belong to the second of these periods. Bergmann's translation and explanation of the latter poem differs very considerably from those in favour with his predecessors; this is especially the case with regard to strophe 45, pp. 257 and 305.

We have only now to notice Simrock's work, which differs from those already discussed inasmuch as it gives a com-

plete translation of the 37 songs of the *Elder Edda*, and from the *Younger*, both *Gylfa ginning*, *Bragarœdur*, and the mythical tales of the *Skalda* which are united to the *Younger Edda* in our own manuscripts as well as in published editions. The translation aims at preserving the alliterative metre of the poetic *Edda*, so it has naturally less verbal accuracy than that of Bergmann; the notes and introductions to the *Elder Edda* are comparatively scanty, those on *Grimnismál* and *Skirnismál* together occupying only eight pages against 110 of Bergmann, and the *Younger Edda* has no notes, as it is supposed to be sufficiently explained by what goes before. The explanation of this difference no doubt is that Simrock presupposes in his readers a considerable acquaintance with the *Edda* and its subjects, and though his preface reproaches Germans with their indifference to these studies, the number of editions reached both by this work and his *Deutsche Mythologie* shows that he really finds a large and intelligent public. Still any one wishing to acquire a knowledge of Norse mythology cannot do better than begin with Bergmann, whose merits as a thorough master of Scandinavian language and antiquities have received honourable recognition in Sweden and Denmark; and if the student then wished to proceed further, he would be able under Simrock's guidance to complete his knowledge of both *Eddas*, especially the *Elder*. Before leaving Simrock (whose work I may discuss at greater length elsewhere), I will allow myself two observations. In the *Fafnismál* (Simrock, p. 200) it is related that Sigurd could understand the voice of birds as soon as he had tasted the heart's blood of Fafnir, transformed into a dragon. This seems to point to an old Oriental superstition, for in Philostr. *Vita Apollon.* 1, 20, we read: ἔστι γὰρ τῶν Ἀραβίων ἡδὴ κουνὸν καὶ τὸ δρύνθων ἀκούειν μαντευσόμενον ὅποσα οἱ χρησμοί. ξυμβάλλονται δὲ τῶν ἀλόγων, σιτοῦμενοι τῶν δρακόντων οἱ μὲν καρδίαν, φασίν, οἱ δὲ ἥπαρ; and the same is said of the inhabitants of the Indian town Paraka (*ib.* iii. 9): λέγονται δὲ καὶ τῶν ζώων ξυνίειν φθεγγόμενον τε καὶ βουλομένων (*var.* βουλευομένων), σιτοῦμενοι δράκοντος οἱ μὲν καρδίαν οἱ δὲ ἥπαρ. On the first passage Olearius says: "Gemina et ex Arabico scriptore Damir habes apud Bochart. *Hieroz.* p. i. l. 1, c. 3, fin." My second remark refers to the famous Danish king Hrolf Kraki (the German *Knirps*, mannikin, dandiprat, not *Krähē*, *kraka*, "crow," as Simrock translates it on p. 353). Of this Hrolf the *Skalda* relates (*Simr.* p. 353) that he was once being pursued by king Adils and his Swedes, and escaped with his followers by scattering gold along the road, which his pursuers stopped to pick up. This trait is paralleled in *Buddhaghosha's Parables* (by Capt. Rogers and M. Müller, p. 43), where the fugitive king Udena uses the same stratagem against the hostile king Kandapaggota; and again in a Teleutic legend (W. Radloff, *Proben der Volkslitter. der Türkischen Stämme Südsibiriens*, Petersb. 1866, vol. i. p. 210), where the following story is told of Schydar Ubang: "He sold all his horses, cows, sheep, and other possessions for copper money, with which he loaded 300 camels. He crossed the waters of the Irtysh, and on the further side he poured out all the copper on the ground. The white king's (*i.e.* the Czar's) three generals and 300 soldiers who were bringing 30 waggons of munitions with them, gathered up the copper money and loaded it upon the 30 waggons. Schydar Ubang said: 'Take the money strewn upon the ground, but do not pursue me.' Thus he deceived them with money, and went back and betook himself to the Chinese." See also Frontin. *Strateg.* 2, 13, 1: "Galli pugnaturi cum Attalo, aurum omne et argentum, certis custodibus tradiderunt, a quibus, si acie fusi essent, spargeretur, quo facilius praeda hostem impeditum effugerent." 2. "Tryphon, Syriae rex, victus, per totum iter

fugiens pecuniam sparsit, eique sectandae Antiochi equites immoratos effugit." Of course these different stories of scattering gold and money may have arisen independently of each other.

In conclusion, I can only recommend the above three works once again most warmly to all classes of readers, and must not omit to quote the last words of Bergmann's preface to *La Fascination de Gulfi*:—"Cet ouvrage se vend au profit de la Bibliothèque de Strasbourg, qui, entièrement brûlée, est à reconstituer." Bergmann was one of the most distinguished professors and dean of the faculty of letters in the former university of Strasburg, whence his interest in the restoration of its library.

FELIX LIEBRECHT.

**Sing-Song**: a Nursery-rhyme Book. By Christina G. Rossetti. With 120 Illustrations by Arthur Hughes. Routledge.

**The Princess and the Goblin.** By George Macdonald. Strahan. **Through the Looking-glass, and what Alice saw there.** By the Author of *Alice's Adventure in Wonderland*. Macmillan.

**More Nonsense**; Pictures, Rhymes, Botany, &c. By Edward Lear. Bush.

It is pleasant to see children's literature get better as it does year by year in England. This season in particular has produced a crop of books that are delightful for them—for the children—but more delightful still, perhaps, for some among their elders; since no child, in the most enchanted eagerness of its single-minded attention and fancy, knows so full or so subtly mingled a pleasure in the best of these things as the properly constituted grown-up reader. The adult spirit here finds the reward of its affliction of self-consciousness. While the attention, the fancy, can let themselves go, and be as those of a child, following the fun or movement of the tale with all the old mirth, the old breathlessness, there lingers, beneath such abeyance of criticism, a more complex self looking on somewhere in the background, aware of the revival of ancient spells, and pleased to feel them work:—you have your own enjoyment to enjoy as well as its object, you have a hundred causes of pathetic entertainment side by side with the old absorption.

The volume written by Miss Rossetti, and illustrated by Mr. Hughes (not, by the way, a matter of story-telling but of song-singing), is one of the most exquisite of its class ever seen, in which the poet and artist have continually had parallel felicities of inspiration—each little rhyme having its separate and carefully engraved head-piece. In the form of the poetry the book answers literally to its title, and consists of nothing but short rhymes as simple in sound as those immemorially sung in nurseries—one only, of exceptional length, containing as many as nine verses—and having always a music suited to baby ears, though sometimes a depth of pathos or suggestion far enough transcending baby apprehension. But both in pictures and poetry, provided they have the simple turn, and the appeal to everyday experience and curiosity, which makes them attractive to children at first sight and hearing, the ulterior, intenser quality of many of these must in an unrealised way constitute added value, we should say, even for children. The pieces range, indeed, as to matter, from the extreme of infant punning and catchy triviality to the extreme, in an imaginative sense, of delicate penetration and pregnancy, with an almost equal grace of manner in either case; here is an example of the latter:—

"What are heavy? sea-sand and sorrow:  
What are brief? to-day and to-morrow:  
What are frail? spring blossoms and youth:  
What are deep? the ocean and truth."

And this is illustrated with one of the best of Mr. Hughes' landscape cuts—a still, flat sea flooded with moonlight, under

a black sky, with a child's sand-castle going to pieces at its edge. There are some dealing with death—a motherless baby, a ring of three dancers from which one is caught away—in just the right mood of tender thought and plaintive wonder, striking the mere note of loss, unexplained disappearance, the falling of an unknown shadow, with the loveliest feeling; and many about out-door things, birds and flowers, animated with an intimate fanciful charity, or having sometimes a little ethical conclusion, of which the lesson cannot fail to find its way home. In tuning the simplest fancies or hints of fragmentary idea, Miss Rossetti cannot lose the habit or instinct of an artist; and the style and cadence of these tiny verses are as finished and individual, sometimes as beautiful in regard of their theme, as they can be, and not much recalling any precedent, except in a few cases that of Blake. We would direct the reader to pp. 6, 13, 21, 38, 40, 120, for perfect scraps of art in their way. Mr. Hughes' illustrations, many of them lovely and full of imagination as we have said, and always seconding the suggestion of the verse, are not quite equal, and the sentiment is sometimes in advance of the design: but what can be more delightful than the child feeding birds at the winter window on p. 8, or its *vis-à-vis* supping porridge in the ingle, or the lambs and ducklings of pp. 27 and 29, or the landscapes of pp. 35 and 79, or the pathetic dance of p. 73, or the pancake-making (79), or, indeed, a full half of them all.

Mr. George Macdonald is a poet also, and in his *Light Princess* had already achieved a humorous and imaginative success in that most difficult of all tasks, the invention of contemporary mythology for children. We should say that with this writer, more than most, it was hit or miss; other pieces in the volume containing *The Light Princess* we should count misses. Here, again, and on a larger scale than before, the hit is palpable and delightful. *The Princess and the Goblin* does not perhaps contain any invention so felicitous as that of the child to whom an evil fairy had denied the physical property of gravity; but it is a thoroughly beautiful and enjoyable story, and its machinery of princess and nurse, heroic miner-boy, evil subterranean goblins, and beneficent supernatural grandmother in her tower, thoroughly calculated to take hold of the imagination of readers of all ages. The suppressed personage within our grown-up reader will be knowing enough to observe, from his background, that there is allegory in all this; aware of the religious and ethical pre-occupations of the writer's genius, he will guess what the beneficent grandmother is meant more or less explicitly to stand for—will, if he chooses, be able to note how it is even the moral and religious foundation that has stimulated the writer's invention and developed the turns and incidents of the story. But all this really does not at all spoil this charming fable, as it has so many others; the narrative and scenic parts of it are conceived with a vividness of their own, alongside of the ethical part of the conception; the characters are delightfully dramatic, and there is nothing strained in the tone of purity and elevation which is given to them. Against unction, when unction passes into such bright imaginative devices as these, and only gives a peculiar ring and fervour to their pathos or their humour, the most uncompromising opponent of moral story-writing can have nothing to protest. Mr. Macdonald in this story is long, detailed; but he has the art of having been there (so to speak); and the attention never flags during all the adventures of the little Irene with her mystic friend in the tower, and the brave Curdie with his goblin enemies in the mine. The sympathetic talent of Mr. Hughes in this volume again has been employed in furtherance of the writer's fancy, and his designs (though not so fully in his choicest manner, perhaps, as those we last spoke of) are very delicate and ingenious.

We pass from poetical enchantment to prose fun in passing from the work of Mr. Macdonald to that of Mr. "Lewis Carroll"—from the transformation scene to the harlequinade, if one may venture that imperfect parallel. *Through the Looking-glass* is a sequel to *Alice in Wonderland*, and has the misfortune of all sequels—that it is not a commencement. An author who continues himself loses the effect, although not the merit, of his originality; and in its originality lay half the charm of the old "Alice." No reader will have the sense of freshness and the unforeseen, amid the burlesque combinations which the little lady encounters in her new dreamland, which he had amid those of the old; hence the inevitable injustice of a comparison. But, making allowance for the sense of repetition, we think the invention here shows no falling-off in ingenuity or in the peculiar humour, which mixes up untransformed fragments of familiar experience with the bewilderment of the polite child amid people of irregular manners and a topsyturvy order of existence. There is perhaps a little too much complication in the machinery of chess-board geography prevailing in Looking-glass Land, and a somewhat meaningless eccentricity in some of the transformations; but the ingenuity which traces out the remotest consequences of its data cannot be too much praised,—as the property of space in Looking-glass Land by which to walk towards a thing is to move away from it, and the inverse disposition of the letters in the amazing nonsense-poem of "Jabberwocky." The introduction and conclusion of the adventure are particularly well devised and written. Every reader will be charmed to meet his old friends the Hare and the Hatter (still engaged upon his tea and bread and butter) dignified with the Anglo-Saxon orthography Haigha and Hatta (Alice has evidently been having lessons in English history); and amused at the forms under which the child's matter-of-fact dream realises the ideas of Tweedle-dum and Tweedle-dee, Humpty Dumpty, and all the provoking brotherhood of mythic personages who insist on taking all words literally, and regarding every question as a riddle. If this prose extravaganza, this matter-of-fact absurdity, has a certain ugliness at times which seems to run near the edge of the vulgar, that is its only weak point. The clever and mannered humour of Mr. Tenniel's designs illustrates their theme to perfection.

A stout, jovial book of *More Nonsense*, by Mr. Edward Lear, transcends criticism as usual. We may just indicate the interest of the preface, in which the author explains the genesis of this class of composition; we may point out the great felicity of some of the new botanical figures and names—"Nastycreechia Krorluppia," "Stunnia Dinnerbellia," and the rest; we may protest, with deference, against the absence of the charms of rhyme in the alliterative pieces at the end of the volume; and then leave the reader to his unmolested entertainment. SIDNEY COLVIN.

*Prince Hohenstiel-Schwangan, Saviour of Society.* By Robert Browning. London: Smith, Elder, and Co., 1871.

MR. BROWNING has always had a predilection for the type of characters which the moralist finds it convenient to class as hypocrites. An artist who begins to analyse character quite disinterestedly is met very soon by the difficulty which character he is to analyse, the character which the man indulges or the character which he assumes; nor is it allowable to cut the knot and say that a man is what he allows himself to be, and is not what he assumes himself to be. The assumption seriously influences his conduct, and it is quite as essential to his comfort that the assumption should impose upon himself as that it should impose upon others;

if it come to the point, he would even prefer to allow himself in less rather than give up the assumption altogether. In fact, the study of human character, in general, might almost be resolved into an attempt to ascertain the true relations between what we claim to be and what we tend to be; and this problem is obviously best approached in the individuals in whom the contrast assumes the most piquant form. In the same way the ethical distinction between honest men and rogues is replaced by the æsthetic distinction between those who recognise and accept and those who rebel against the inevitable contrast between the ideal and the natural self. On the one side we have Mr. Sludge and Bishop Blougram and the bishop who orders his tomb in St. Praxede, and the other bishops who display their successful or unsuccessful diplomacy in the *Return of the Druses* and *The Soul's Tragedy*; on the other side, there is the noble Djebal, one of the loftiest of all tragic characters, and the pitiful Chiappino and poor Mr. Gigadibs. It is worth noticing that Djebal comes nearest to the common conception of a common imposter, just because his enthusiasm is too deep not to be practical, too sustained not to become unscrupulous, while the worthless Gigadibs is too shallow to be unsincere.

Of course the Saviour of Society belongs to the more intelligent if not to the more estimable class. The machinery of the poem is intricate, and it is difficult to believe that the whole of it was written upon a single plan. For 142 pages out of 148 the Saviour of Society, in exile, is explaining his career to a young lady; nearly 60 pages of the explanation are a history of his reign as it ought to have been, which is carried down to the end of the Italian war. Here the speaker discovers that it is five o'clock in the morning, opines that the young lady is asleep, moralises on the impossibility of a really sincere *apologia pro vita sua*. In the last half-page we learn that he has not yet begun his second exile, has no young lady to talk to; but the whole reverie has arisen out of the possible consequences of an ultimatum, which he has still to decide upon sending. On the other hand, he says early in the poem:—

"I could then, last July, bid courier take  
Message for me, post-haste, a thousand miles."

These lines and the whole context prove that the speaker was intended to be actually in exile, not merely anticipating what he would say when he was. It seems as if the poet had felt the ideal history of Prince Hohenstiel-Schwangau's reign was getting too long, and had altered his plan in order to cut it short with effect: in a way the effect is gained, but it is at the price of an inconsistency which makes the last six pages very obscure. Another matter for regret is that the history of Hohenstiel-Schwangau should be simply identical with the history of France. One can understand the author's motive for choosing to write of Hohenstiel-Schwangau; but the choice entailed obvious obligations. It would have been very indecorous for Johnson to make the senate of Lilliput debate an expedition to Canada, and it is little better to make Thiers an historian, and Victor Hugo a poet of Hohenstiel-Schwangau.

The Saviour of Society is, as might be expected, a very interesting personage, a little tedious to those who are beginning his acquaintance, but decidedly attractive and even fascinating when we come to know him well. He is represented as a kind of democratic man of order, a Sulla of the proletariat, incapable of founding anything, but capable of organizing and consolidating much.

His exposition begins by pointing out that even when he is playing with a sheet of blotting paper, he prefers drawing a line between two blots that are there already to making a third, which proves a predisposition on his part to avail him-

self of existing materials. Some sixty lines are allotted to bring this piece of information adequately home to the reader, and of the sixty quite the usual proportion are elliptical, and none are empty. It is an extreme result of the author's deliberate system of endeavouring to present the processes not merely the products of thought. With this predisposition he enters upon life determined to please himself and serve God by making the best according to his own judgment of the faculties of which he finds himself in possession. The example of the courier, cited above, who must reach his journey's end in time, but may select the stages, and halt or hurry at his own discretion, serves to illustrate the kind and the extent of the responsibility under which the speaker conceives himself to act. Others, he is willing to allow, may have something like what is ordinarily called conscience to direct the details of their conduct; he has to judge exclusively by the light of general principles, by the facts of life, by the signs of the times. He finds himself inclined and qualified to govern a world that has laboriously and gradually reached a complicated harmony, which, though most imperfect, is tolerable. He is filled with respect for this order and compassion for the multitude—

"Men with the wives and women with the babes,"

who desire nothing better than to be allowed just to live and work under it. He determines to devote himself to the defence of the mediocre positive results of civilisation against the enthusiasts who would destroy them in the pursuit of incompatible ideals. If the average duration of life were a hundred years instead of twenty, he would risk the responsibility of carrying out one of the ideals he advocated himself in the days when he was only a voice like his critics. As it is, he consoles himself with the thought that the low interests which unite the many are more in one sense than the high interests which divide the few who had better do their best—

"Without this fractious call on folks to crush  
The world together just to set you free."

The accusation of indolence and indecision is met by a capital story of the Laocoon, which, it seems, was once exhibited without sons or serpents, and taken almost universally for a figure of Somnolence. One critic only whom the Saviour of Society would choose for his biographer said—

"This attitude  
Strives with some obstacle we do not see."

The faults of his reign are attributed to an excess of sagacity which led him to profit by the crime of his predecessors to occupy Rome, to avoid the chance of civil war by a *coup d'état* incompatible with ideal loyalty, to wean Hohenstiel-Schwangau from war by false pretences, to obtain territorial advantage by the Italian war, to temporise with the papacy, and, above all, to try to found a dynasty.

The exposition is less perplexed than in Mr. Browning's earlier works, perhaps less richly coloured; though it would be difficult to parallel the musical elevation of the following passage:—

"Ay, still my fragments wander music-fraught,  
Sighs of the soul, mine once, mine now, and mine  
For ever! crumbled arch, crushed aqueduct,  
Alive with tremors in the shaggy growth  
Of wild-wood, crevice-sown, that triumphs there,  
Imparting exultation to the hills!  
Sweep of the swathe when only the winds walk  
And waft my words above the grassy sea  
Under the blinding blue that basks in Rome,—  
Hear ye not still—'Be Italy again'!  
And ye, what strikes the panic to your heart?  
Decrepit council-chambers,—where some lamp  
Drives the unbroken black three paces off  
From where the greybeards huddle in debate,  
Dim cowl and capes, and midmost glimmers one

Like tarnished gold, and what they say is doubt,  
 And what they think is fear, and what suspends  
 The breath in them is not the plaster patch  
 Time disengages from the painted wall  
 Where Rafael moulderingly bids adieu,  
 Nor tick of the insect turning tapestry  
 To dust, which a queen's finger traced of old ;  
 But some word, resonant, redoubtable  
 Of who once felt upon his head a hand  
 Whereof the head now apprehends his foot."

G. A. SIMCOX.

### NOTES ON LITERATURE AND ART.

The articles of Chief Justice Cockburn on Junius are unavoidably postponed for one or two numbers.

The *Westminster Review* for this month has a very interesting but incomplete article on Greek tragedy and Euripides. There is a good account of the conditions under which a great dramatic era is possible. It is shown how after a certain stage in dramatic art as in other art the execution tends inevitably to overpower the idea ; and how Euripides coming at this stage made the most of the romantic and picturesque possibilities of Greek tragedy. Much is made of analogies from painting too suggestive not to be misleading. For instance, we are told that Correggio gave a disproportionate development to some elements of beauty which were subordinate in Raphael, and that Euripides gave a disproportionate development to elements of interest that were subordinate in Sophocles. But the pictures of Correggio, and for that matter the plays of Fletcher, are thoroughly complete and harmonious ; for the most part the plays of Euripides are not. The point of the attacks on Euripides is missed. Those who say that Euripides debases tragedy are quite aware that he wrote splendid poetry : they would be quite ready to admit that the ethical elevation of Sophocles could not be maintained for ever. Their quarrel with Euripides is not that his creations are romantic rather than classic ; but that their habitual background is a vulgar selfish sophistry.

M. Gaidoz, in the same place, publishes some interesting translations of the Breton poetry inspired by the events of the late war ; which appears in most cases to have been written not by the people but certainly for it, since the *bourgeoisie* look down on their native idiom. The writer believes that the Breton peasants, like the Welsh, would learn to read readily if they had books in their own language, and it is curious that the Legitimists and Republicans have to bid against each other in *patois* for the country vote. The manifestoes of the former are said to be the best models of style, as many of the clergy have made a special study of Breton literature.

A shareholder in the "Société d'Acclimatation" sends to *Fraser* a short account of the fate of the Jardin and its inmates. Some few of the most valuable animals were sent out of Paris just before the commencement of the siege, and the remainder were reluctantly disposed of to the butchers, fetching, however, their full money value. The gardens themselves were devastated under the Commune, and the society is treating with the city of Paris for the repurchase of the land ceded to it, but it offers to superintend the reorganization of the work, and a fresh company is spoken of to carry this out on a larger scale than before.

Afzelius, the venerable collector of Swedish folk-songs, died on the 25th of September last at Euköping, where he had been pastor for forty-nine years. His great work, *Svenska Folkets Sagohäfder*, was completed in 1870, the last part containing the history of Charles XII., since when no true popular legends have come into being.

We have received a specimen number of a new series of the *Oesterreichische Wochenschrift für Wissenschaft und Kunst*, which formerly appeared for a few years as supplement to the *Wiener Zeitung*. There ought to be plenty of room for such a periodical, especially if it does not give too much space to the miscellaneous *feuilleton* element. In this number the principal

papers are by A. Mussafia on F. Diez, *à propos* of the 50th anniversary of his doctorate ; and Fr. Lippmann, "Die Styltendenzen im Kunstgewerbe." The author thinks that the initiative un-reality of modern art and architecture can only be superseded by a healthier and more independent tone of workmanship, on condition that the Renaissance is frankly accepted as its base and starting-point.

There is a Breton work now in the press, to be published next spring, by Mrs. Legoffic, Lannion, which will have some interest for the literary world at large. It is a mystery (*Tragedi*, as the Bretons call it), the subject of which is the well-known Purgatory of St. Patrick. The most striking peculiarity of this mystery is that a few scenes are nearly identical with some passages in a drama of Calderon, who has treated the same subject. It will be interesting to trace these resemblances to an original work. The mystery will be published without French translation, as it is intended for the Breton-reading public only. Bretons are very fond of reading—and of performing—mysteries ; but when such a performance takes place in some Breton village, it is apt to pass unnoticed, even in France.

The discoveries made in the neighbourhood of Bologna must take the first place amongst the events of archaeological interest which have occurred during the past year. A full account will be found in a paper, "*Sugli Scavi di Certosa*," read by the architect Signor Antonio Zannoni, at the inauguration of the museum of Bologna, Oct. 2, 1871, and which is now printed. Signor Zannoni has excavated an entire necropolis, near the Campo Santo of Certosa. It is supposed that the ancient town Felsina had here its burying-place. No less than 365 graves have been opened with various results. A peculiar interest attaches to these discoveries, because they throw light on the life and culture of Etruria *circumpadana*, a district in which, as compared with Etruria *media*, very little has been found. From the position and state of the bodies, and character of the contents of the tombs, it must be inferred that much the same habits and much the same point of taste prevailed as in middle Etruria. Amongst the stele-shaped monuments are many with reliefs, but none with inscriptions. The style in every instance shows Greek influence. Bronzes are numerous, and so are ornaments of bronze, of silver, of ivory, of gold, &c. Relatively to these, the discoveries at Marzabotto, a small railway station south of Bologna, are unimportant (see Gozzadini's *Di un antica necropoli a Marzabotto nel Bolognese*), though at any other moment they would excite much interest.

Dr. Heinrich Schlieman reports (*Allgemeine Zeitung*, Jan. 7) his excavations on the fields of Troy as stopped by the arrival of winter, but confidently asserts that early next spring he will be in a position to demonstrate the exact position of Troy, 35 feet below the present level (!).

In November last Hans Makart publicly exhibited in his atelier paintings on which he has for some time past been engaged. They were executed on the commission of Herr Nic. Dumba, and consist of a large square ceiling-picture and a number of large and small portions of a frieze, forming together the entire decoration of a room. On three sides there are tolerably considerable spaces, broken only by occasional doors, but on the fourth a succession of windows leaves only narrow strips of wall, and these are filled with allegorical single figures. The principal composition extends itself unchecked over the ceiling. The subject is *Die Vereinigung der praktischen mit den idealen Mächten des Lebens*. Agriculture and Industry, Art and Music, are brought before us by a vast number of figures, genii, and demigods, conceived partly in an allegoric, partly in a realistic sense. These are intermixed with all the sense-ensnaring decorative accompaniments special to Makart's genius. Festoons and fruits, costly vessels, and all sorts of beasts, are introduced in wild and various interchange. We are told that many of the subordinate incidents are very happy ; for instance, a dance of children round a fruit-tree, the counting-house studies of the genius of trade, and a scene in the studio of a little portrait painter. But, however brilliant may be the display in this new work of an enviable wealth of individual types, and magnificence of colour *bravura*, there is no advance in the

qualities of sound drawing and modelling, or in refinement of artistic style. This is what the uncompromising admirers of Makart have announced to us from year to year, but as yet no trace of such an advance can be perceived.

The auction Gsell will take place in Vienna on March 15. The exhibition of the works about to come into the market is already going on. The catalogue, which is not yet complete, will contain from fifty to sixty illustrations. The gallery contains many pictures of the first rank, both by ancient and modern masters. For example, Franz Hals, Rembrandt, Metz, Ruysdael, Cuyp, Teniers, v. d. Meer von Haarlem, Veronese, Tintoret, Tiepolo, Cranach, may be cited amongst the ancient; and the modern are represented by Waldmüller, Pettenkofen, Troyon, Meissonier, Decamps, Couture, and others. The collection of prints and etchings has a great repute; and, finally, there are numerous precious objects and antiques.

### New Books.

- ADLER, F. *Das Pantheon zu Rom*. Gedruckt auf Kosten der archaeol. Gesellsch. Berlin: Besser'sche Buchh.
- BEHN, Mrs. *Aphra. Plays, Histories, and Novels of the Ingenious*. 1724-35. Small paper. 6 vols. (2l. 12s. 6d. and 4l. 4s.) Pearson.
- BURNS, R. *The Original MS. of Tam o' Shanter and The Lament of Mary Queen of Scots*. Reproduced by the Photo-chromo-lith. Process. With an Introduction by Moy Thomas, and a Glossary. Adams and Francis.
- EASTLACK, C. L. *History of the Gothic and Medieval Revival in England*. Longmans.
- FERRAZZI, G. J. *Enciclopedia Dantesca*. Vol. IV. Bibliografia. Venezia: Münster.
- MARTIN, H. *Études d'Archéologie celtique. Notes de voyages dans les pays celtiques et scandinaves*. Paris: Didier.
- PETZOLDT, J. *Bibliographia Dantea ab anno MDCCCLXV inchoata. Accedit Conspectus Tabularum Dio. Com. vel stilo vel calamo vel penicillo adhibitiss illustrantium*. Dresdae: Sumpt. Schönfeld.
- SCHULZE, E. *Beschreibung der Vasensammlung des Freiherrn Ferdinand von Leesen*. Teubner.
- TAINE, H. *History of English Literature*. Vol. II. Translated by H. van Laun. Edmonston and Douglas.

### Philosophy and Physical Science.

**The Works of George Berkeley, D.D.**, formerly Bishop of Cloyne: including many of his Writings hitherto unpublished. With Prefaces, Annotations, his Life and Letters, and an Account of his Philosophy. By Alexander Campbell Fraser, M.A., Professor of Logic and Metaphysics in the University of Edinburgh. 4 vols. Oxford: Clarendon Press, 1871.

THE merits of Professor Fraser's edition of Berkeley have been so generally recognised that in the present article, which from causes that could not be prevented is too late in its appearance, it is needless to notice them in detail. The only fault that we have to find with him is that he has in a certain sense over-edited his author, and tends to make him mean too much. In addition to valuable analyses and explanations prefixed to the several treatises, Professor Fraser accompanies them with a running criticism and elucidation at the foot of the page, and finally, in the volume containing Berkeley's life and letters, writes a general essay on his philosophy and on "his function" in relation specially to Hume and Kant. It is in this essay chiefly that he seems to us to carry too far the interpreter's licence of unfolding what his author "would have said," and partly by translating him into the language of later philosophy, partly by reading his earlier treatises in the light of certain flashes of Platonism that appear in the *Siris*, to obscure the edges of the very definite, though not far-reaching, theory which Berkeley completed in his youth, and which we only confuse by supplementing with the deeper, but insufficiently articulated, speculations of his later life. The limits, indeed, of Berke-

leyanism proper are very clearly pointed out by Professor Fraser himself up and down in his notes, and in attempting to state them we do not suppose ourselves to be bringing before him anything which he has not himself fully considered, but merely to be supplying a corrective to the over-estimate of Berkeley which some readers might derive from his work.

Berkeley's strength and weakness as a speculator alike lay in his practical interest. Of a strange precocity in philosophy, unparalleled probably except in the case of Schelling, he yet had not the spirit for pursuing truth to the bottom of her well. In the *Commonplace Book* kept during his residence at Trinity College, Dublin (now first published by Professor Fraser, and which alone would make his fourth volume worth buying), we already find his theory ready-made, only lacking the perfect literary form of the treatises which he afterwards published. The question is as to the constructive value of this theory; of its validity for the destructive purpose, for which Berkeley intended it, no one who understood it has ever doubted. He found practical irreligion and immorality excusing itself by a theory of "materialism"—a theory which made the whole conscious experience of men dependent on "unperceiving matter." This, whatever it might be, was not an object which man could love or reverence, or to which he could think of himself as accountable. Berkeley, full of devout zeal for God and man, and not without a tincture of clerical party-spirit, felt that it must be got rid of. He saw that the "new way of ideas" with which his teacher Molyneux had familiarised him had only to be made consistent with itself, and the oppressive shadow must disappear. Ideas according to that "new way" (or, to speak less ambiguously, feelings) make up our experience, and they are not matter. Let us get rid, then, of the self-contradictory assumption that they are either copies of matter—copies of that of which the sole and simple differentia is that it is not an idea—or its effects—effects of that which we can only describe as the unknown opposite of the only efficient power with which we are acquainted—and what becomes of the philosopher's blind and dead substitute for the living and seeing God?

The object was a worthy one, and doubtless Berkeley has had his share in the most obvious service which philosophers render to their kind. He has done something to save reflecting men from the bondage which comes of misinterpreting formal ideas; but, as we think, not quite so much as Professor Fraser would have us believe. He took—as might be expected of a philosopher whose latest systematic treatise was published when he was 28—too short a cut to his end. He worked merely with the means which Locke put into his hands, and thus, while his destructive method was invincible, his untamed mortar would not really hold together the fabric of knowledge and rational religion which he sought to maintain.

It is true that his polemic, according to his own intention, was directed not against the supposition of the reality of substance *as such*, but against its reality as the antithesis of mind, or, in the language of the time, against "unthinking substance"—"body" or "matter." To show the untenability of such a supposition upon the principles of Locke was not difficult. The question is whether upon those principles anything survives but the succession of feelings severally "real" only in the moments of their presence to consciousness and as manifold in their diversity as are those moments; and whether Berkeley has any new principles to substitute for those of his master. If these questions are answered in the negative, it will follow that the title, which Professor Fraser (though with much abatement) seems to claim for him, of having in some sort anticipated

Kant, is not fairly earned; that in result, though not in intention, he merely did imperfectly what Hume did perfectly; that his polemic is valid not against "unthinking" substance and causality merely, but against substance and causality altogether; not merely against the reality of "outwardness" to the mind, but against the reality of outwardness as an intelligible relation between bodies; and that thus finally, to say nothing of its bearing on the belief in God and immortality which it was meant to uphold, his doctrine, fairly carried out, rendered the knowledge of nature no less than mathematical knowledge an unaccountable fiction.

It scarcely needs to be said that the governing notion of Locke's philosophy had been that of the antithesis between "facts" and "things of the mind"; and a moment's consideration will show the difficulties which this antithesis has in store for a philosophy which yet admits that it is only in the mind or in relation to consciousness—in one word, as "ideas"—that facts are to be found at all, while by the "mind" it understands an abstract generalisation from the many minds which severally are born and grow, sleep and wake, with each of us. The antithesis itself, like every other form in which the impulse after true knowledge finds expression, implies a distinction between the seeming and the real; or between that which exists for the consciousness of the individual and that which really exists. But outside itself consciousness cannot get. It is there that the real must at any rate manifest itself, if it is to be found at all. Yet the original antithesis between the mind and its unknown opposite still prevails, and in consequence that alone which, though indeed in the mind, is yet given to it by no act of its own is held to represent the real. This is the notion which dominates Locke. He strips from the formed content of consciousness all that the mind seems to have done for itself, and the abstract residuum, that of which the individual cannot help being conscious at each moment of his existence, is or "reports" the real, in opposition to the mind's creation. This is feeling; or, more strictly, it is the multitude of single feelings, "each perishing the moment it begins," from which all the definiteness that comes of the mind's own act in the way of composition and relation must be supposed absent. Thus carried out, the antithesis between fact and mental fiction becomes self-destructive. Detach all mental accretions, and there remains nothing in which one feeling differs from another but the degree of its liveliness. It is to this, as constituting the distinction of the real from the unreal, that Hume in his treatise on Human Nature finally comes, and Berkeley himself was quite aware that his erasure of Locke's inconsistencies left him no criterion of reality external to the feeling itself. The essential distinction between his result and Hume's reduces itself to this, that whereas with Hume that which in the language of later philosophy is called "objective order" becomes an unaccountable fiction of thought, and reality becomes merely a name for the liveliness (of indefinite degree) with which one feeling, if itself lively, recalls another; with Berkeley, on the other hand, reality means an order of sensations in a divine consciousness to which their succession in us, according as they are vivid and coherent or the reverse, does or does not correspond. It is this divine consciousness which with him takes the place which "qualities of matter" or "nature" held with Locke, as that which our ideas, if real and adequate, represent.

To have demonstrated such direct dependence of human experience upon God, Berkeley reckoned his great service to mankind, by which he had silenced the atheists for ever. The value of the service to his own generation is not in question. Each generation requires practically to be delivered from the "bondage of matter" according to the

philosophical method with which it is familiar. But in order to estimate its value as a permanent contribution to speculative theism, we must ask two questions. Taking the three steps of Berkeley's short and easy method—sensible things are merely sensations, sensations imply a sentient subject, this subject must be one whose consciousness is absolutely permanent and continuous, *i.e.* God—is not the process, by which the first step is established, itself fatal to the third? And supposing this difficulty to be got over, is not the one subject, whose being is proven, simply the μέγα ζῷον of the crudest form of pantheism rather than the Christian God? To the first of these questions the answer must ultimately depend on the meaning to be attached to the "percipi" with which Berkeley identified the "esse"—a meaning which Professor Fraser in several places (*e.g.* on pages 373 and 387 of vol. iv.) seems to us unwarrantably to extend. From the introduction and earlier sections of the *Principles of Human Knowledge* it is quite clear that the "percipi" with him primarily meant present feeling and no more. A thing *is*; that is, I now feel: it *was*; that is, I did feel. This doctrine can legitimately lead to no result but Hume's. It is fatal alike to the reality and knowability of permanent subjects or "spirits," as much as of bodies and their relations. There is evidence from the Commonplace Book that Berkeley had at least an occasional forecast of this result, and in his published treatises we no doubt find him feeling his way towards a different account of the "percipi" according to the exigencies of his theistic theory. Thus we find him in section 89 of the *Principles of Human Knowledge* quietly introducing "spirits and relations" as being no less than "ideas," objects of human knowledge, in virtual contradiction of the opening section of the same treatise. But no trace appears of any such account of the "percipi," into which "esse" is resolved, as would justify us in interpreting it as the "intelligi." "Spirits and relations" are brought within the region of knowable reality when they are wanted, but there is no reasoned vindication of their position, and at so late a period in his life as the publication of the *Analyst* we find Berkeley reverting to his original sensationalism for a weapon against the mathematicians. The imaginary "real" outside consciousness he had effectively disposed of, but for any effective replacement of it by an intelligible and necessary element within consciousness we search his pages in vain. For his theistic purpose he had proved either too much or too little. The latter part of the *Siris* is mainly of interest as showing that the theistic instinct (if we may say so) survived his system, and was feeling after a philosophical apparatus wholly different from his original one. Such a statement as that "the principles of science are objects neither of sense nor imagination; intellect and reason being alone the sure guides to truth," is wholly irreconcilable with the doctrine of his earlier treatises. The worst of it is that, while it is merely "shot from a pistol," the earlier doctrine is fully worked out, and can alone be fairly treated as the Berkeleyan system. Professor Fraser is quite aware of the distinction, but in "developing Berkeley's thought" he seeks to introduce a consistency which we think unreal between his earlier and his later mind, and in so doing detracts from the "propædæutic" value of the study of Berkeley, which is in brief that it shows the necessity of Kant.

T. H. GREEN.

### *Intelligence and Notes.*

#### *Zoology.*

**Embryology of Arthropoda.**—Dr. Dohrn's *Untersuchungen über Bau und Entwicklung der Arthropoden* (parts 1 and 2) attempts to follow out the line of genealogical investigation which is an offshoot of the

Darwinian theory, and has been so brilliantly initiated by Fritz Müller in his essay, *Für Darwin*. Furnished with the maxim, that "the ontogenetical development is a short and incomplete representation of the phylogenetical development," Dr. Dohrn reviews the embryology of the different classes and families of the Arthropoda, to ascertain where they agree and where they differ. Thus he has examined the embryology of the Cumacea, the Pycnogonidae, Pranita, Tanais, Palinurus, and Scyllarus, Limulus and some other Crustacea, of which he gives a detailed account, accompanied by numerous illustrations. Amongst these monographs those on the Pycnogonum, Palinurus, and Limulus are especially remarkable. As regards Pycnogonum, Dr. Dohrn states that the greater part of the family undergo an extensive metamorphosis; and he proves that the so-called "palpi" and "female feet" are both typical pairs of appendages, which are sometimes wanting in the adult, but are always developed in the larvæ. The number of these typical appendages being thus fourteen, Dr. Dohrn adduces it as a strong argument against those zoologists who, like Gerstäcker and others, place the Pycnogonidae amongst the Arachnida on account of some superficial similarities of the adult. Dohrn adds to his account the description of the development of Phoxidilidium, which differs in a remarkable way from the other Pycnogonidae, as there occurs no larval condition whatever. Instead of it there is a larval skin, representing the lost larval form. This larval form he refers to Nauplius. With regard to Palinurus and Scyllarus, Dohrn proves that in spite of Professor Claus and Mr. Spence Bate's doubts, Phyllosoma is the true larval form of these Macrura. He succeeded, by applying a constant stream of sea-water running over the eggs of both the Crustacea, to breed and hatch them. The larval forms produced were Phyllosomæ. Limulus has received much attention of late in connection with the alleged discovery of a trilobite with legs. Mr. Billings in Canada and Mr. Woodward in England, as well as Mr. Cope and Mr. Packard in America, have put forth opinions about these animals, and they seem to agree in grouping the Trilobites together with the Isopoda, and in excluding Pterygotus as well as Limulus from the Trilobites.\* Dr. Dohrn treats these questions in an elaborate article in the *Jenaische Zeitschrift für Medizin und Naturwissenschaft*, a periodical known as being the organ of German Darwinism, receiving its contributions from Gegenbaur, Haeckel, Fritz Müller, Wilhelm Müller, and others of the Jena school. Dr. Dohrn arrives at the conclusion that Limulus, Pterygotus, and the Trilobites ought to form one great family, whose connection with the other Crustaceans is still doubtful. He refuses to admit any connection of Limulus with the Isopoda, as suggested by Mr. Woodward and Professor Huxley. The same periodical contains the first part of a memoir, by the same zoologist, entitled, "History of the Crustacean Tribe, based on Anatomical, Embryological, and Palæontological Facts." Dr. Dohrn here endeavours to give the outlines of the history of the crustacean tribe, beginning from the Nauplius, and tracing the diverging lines to the different crustacean families. As regards Insects, Dr. Dohrn only gives some hints in the preface of his second part. He says that he took up the subject of insect embryology at the same time with the Crustaceans, but he soon arrived at important discoveries bearing upon the old problem of the homology between Arthropoda and Vertebrata. We shall probably have to wait for the result of these researches till Dr. Dohrn has finished building the zoological station at Naples, with which he is at present almost exclusively occupied.

**Micrococcus in Measles and Scarlet Fever.**—An important paper, if the facts stated in it be corroborated by other and independent research, is contained in the last part of Hallier's *Zeitschrift für Parasitenkunde* (Band iii. Heft 2), written by Dr. Hofmann. This practitioner treats measles and scarlet fever by the hydropathic method, that namely of enveloping the patient with due precaution in wet linen cloths, and thus promoting a free perspiration, which lowers the temperature of the body and quickly cures the disease. Hallier and others maintain that these diseases are occasioned by the presence and development of certain fungi in the blood, which they state can be seen in it by the microscope in the form of minute cell-like bodies or spores, the so-called micrococcus. It occurred to M. Hofmann to collect the perspiration obtained from the patients enveloped in the wet bandages, and to send it to M. Hallier with a request that he would examine it for the micrococcus. M. Hallier replied that micrococcus was abundant, and at once proceeded to institute experiments with a view of determining whether the specific disease could be propagated by inoculation or other means. The results of their researches have not yet been published, but if successful, they will go far to show that these affections are really due to the presence of a fungus in the blood, for when it is present the disease exists, and when removed it ceases, whilst the fluid excreted from the skin of the sick, and known to contain the fungus, is capable of generating disease in the healthy.

\* Mr. Woodward has carefully reviewed Dr. Dohrn's investigations in a paper communicated to the Geological Society on December 20, 1871, entitled "Further Remarks on the Relationship of the Xiphosura to the Euryptera and to the Trilobita," in which he maintains that these orders should be still retained in the class Crustacea.

**Inland Locality for Marine Insects.**—At a recent meeting of the Norfolk and Norwich Naturalists' Society, Mr. Barrett read some further notes on the coast-insects found at Brandon, which he considered confirmatory of the opinion expressed by him in a former paper, that these species have occupied this district, now far inland, from the time when it was part of the sea-coast. Amongst other coast-species mentioned by Mr. Barrett was *Agrostis Tritici*, and of this species he remarked that, although it occurs sparingly in inland heaths, all the specimens are of a dull brown colour, while those found on the sea-coast are generally distinctly marked and richly coloured; all those taken by him at Brandon had precisely the deep style of colour and markings which characterize it on the sea-coast. *Agrostis cursoria*, although very abundant on the sea-coast, is not to be found at Brandon; and this Mr. Barrett considers a very strong proof that the other strictly littoral species enumerated have not reached their present situation by migrating across the intervening land from the present sea-coast. This species he thinks it not improbable was an immigrant from the eastward at a comparatively recent date, and that it has attained its greatest abundance on the spots where it first obtained a footing. It would not, therefore, have been an inhabitant of this portion of the post-glacial coast.

**Application of Photography to Illustrations of Natural History.**—Hitherto memoirs on natural history have been but seldom illustrated by the aid of photography (for instance, a memoir on fossil rhinoceroses by Dr. Kaup), the want of permanence of the common photographic prints having made them mere auxiliaries to lithography. Prof. Alexander Agassiz proposes now to apply the new Woodbury and Albert processes of carbon-printing to the illustrations of his forthcoming *Revision of the Echini*. There can be no doubt that photography offers the great advantages of rapidity of production and cheapness, but we doubt whether it will replace lithography to any great extent. Its use will be limited to rigid objects; and even then it will not always satisfy the demands of scientific enquiry. In numerous cases, as, for instance, in faint and incomplete traces on a fossil, or in anatomical preparations, we have to give the outlines of certain structures greater distinctness than they have in nature, in order to render important characters more apparent. When we examine the specimen of photographic printing (of *Echinocardis punctulata*) issued by Professor Agassiz, we cannot help thinking that a skilful lithographer would have produced a drawing quite as accurate and faithful to nature, and certainly with the sculpture much more clearly delineated. However, it is satisfactory to see this method put to the test, and we wish every success to this highly important undertaking of Professor Agassiz.

**Observations on Parthenogenesis.**—A most important article, entitled *Quelques Observations de Parthénogénèse chez les Lépidoptères*, has been published by H. Weijenbergh in *Archives néerlandaises*, vol. v. pp. 258-264. In August 1866 the author found a male and female of *Liparis dispar* in the act of fecundation, and obtained some 500 eggs, from which, in the year following, the caterpillars were reared. The perfect insects appeared in July. Every precaution was taken to keep the two sexes separate: this was easily effected, as they could be distinguished in the larval state. Of about sixty females two-thirds laid eggs without fecundation; but the number of eggs was much smaller than under normal conditions, none of the females depositing more than twenty. The author obtained altogether about 400 unimpregnated eggs, but only some fifty caterpillars were reared from them. In due time they passed through the metamorphosis, the number of females being fourteen. Strange to say, these virgin insects, born of virgin mothers, deposited again a number of eggs, from which again caterpillars were reared in April 1869, and perfect butterflies in July. Their eggs, however, appear not to have preserved vitality, having been found dried up in the spring of 1870. Thus, after the normal impregnation of a female, eggs were laid by three successive generations without fecundation. As far as is known at present, this extraordinary power of reproduction is possessed by a comparatively small number of insects, the subject having been best studied in the common bee and in Aphides.

**On the Period of Sexual Differentiation in the Ova of Insects.**—Siebold and Bessel had proved that in insects the differentiation of the sex takes place in impregnated eggs before the larvæ are hatched. In a highly interesting paper published in the 48. *Jahresbericht der Schlesischen Gesellschaft f. vaterländ. Cultur* (Breslau, 1871), p. 143, Dr. Gustav Joseph shows that the sexes are differentiated before the ova have come in contact with the *sperma virile*. He observed that with a little practice two different forms of ova can be distinguished in *Liparis dispar*, *Orgyia gonostigma* and *antiqua*. The ova of the one form are comparatively thicker, with the greatest transverse diameter nearly in the middle of the egg, and with the opposite poles scarcely differing in shape; these ova of this kind are less numerous than the other, and invariably contain females. Those of the latter form are comparatively slender, with the greatest diameter nearer to the upper pole, which is more obtuse than the lower; as has been stated, they constitute the majority, and male insects are hatched from them. Now, as these two kinds of ova are found in the oviducts of females reared from

caterpillars and kept apart from males, it is evident that the differentiation of the sexes is independent of the *sperma virile*, which has simply a vivifying function, and is even not absolutely necessary for the reproduction of life in insects endowed with the power of parthenogenesis.

**Ceratodus.**—Dr. Günther's *Description of Ceratodus, a Genus of Ganoid Fishes recently discovered in Rivers of Queensland, Australia*, has been issued. This paper contains a description of the whole anatomy with the exception of the nervous and circulatory systems, which will form the subject of a separate memoir. The author proves the close affinity of this fish to *Lepidosiren* and *Dipterus* (and, consequently, also to *Ctenodus*), and arrives at the conclusion that the ganoid and cartilaginous fishes should be united into a separate subclass, *Palæichthyes*, which approaches the batrachian type in many important parts of its organization. Thanks to the liberality of the Royal Society, the paper is illustrated by thirteen plates executed by Mr. G. H. Ford.

**Passat-dust and Blood-showers.**—Professor Ehrenberg, who has published from time to time the results of his examination of those microscopic bodies that are carried by the atmosphere and deposited either as passat-dust or as substances of a red colour, has collected all the observations on this subject made by him between the years 1847 and 1870. This important memoir, consisting of 150 pages, two tables, and two plates, will appear in the forthcoming volume of the *Transactions of the Berlin Academy for 1871*. He enumerates all the instances of these phenomena which have been placed on record; the earliest being a case of a dust-shower which fell for ten days in the Chinese province Honan, in the year 1154 B.C. As his examination was directed chiefly to organisms contained in the dust, the analysis was entirely microscopical, not chemical. The number of analyses made by himself is altogether seventy, and he was able to distinguish not less than 460 distinct forms of organic life, among which were 194 *Polygastra*, 145 *Phytolitharia*, and 25 *Polythalamia*.

**King-Crabs and Trilobites.**—Professor E. van Beneden (*Compt. rend. Soc. Entomol. Belg.* October 14, 1871) has studied the embryonic development of *Limulus polyphemus*, and has come to the conclusion—1. That the *Limuli* are not Crustaceans, as none of the characteristic phases of the development of Crustacea can be distinguished; and that, on the other hand, their development shows the closest resemblance to that of the Scorpions and other Arachnids. 2. That the affinity between the *Limuli* and Trilobites cannot be doubted, and that the analogy between them is the greater in proportion as we examine them at a less advanced period of their development. 3. That the Trilobites as well as the Eurypterida and Pœcilopoda must be separated from the class Crustacea, and form, with the Arachnids, a distinct division.

**The Collection of Snakes in the British Museum.**—From a statement made by Dr. Günther, in the January number of the *Annals and Magazine of Natural History*, it would appear that the national collection, which in the year 1858 contained 480 species of Snakes represented by 3990 examples, possesses now 920 species represented by 5500 examples. The number of typical specimens is 366, the total number of species of Snakes known at present being calculated at about 1100.

**The Videnskabelige Meddelelser fra den naturhistoriske Forening i Kjøbenhavn for 1871** (Nos. 1–10) contain only two zoological papers:—1. A contribution to the life-history of the Frogs and Toads of Denmark, by J. Sahlert; and 2. Revised list of the Echinoderms inhabiting the coasts of Denmark, with information regarding their distribution on the Danish coasts, by Chr. Lütken.

The forty-eighth annual report of the *Schlesischen Gesellschaft für vaterländische Cultur* (Breslau, 1871) contains, beside notes on the skull of *Galeopithecus volans* by Prof. Grube, the following zoological papers:—On new species of the genus *Sabella*, by Prof. Grube; on the Amphipeteneæ and Ampharetææ, by the same; on two new forms of *Heteronereis* and *Pycnogonidæ*, by the same. The report of the entomological section of the society contains some important papers, viz. by Dr. Gustav Joseph: on the time of sexual differentiation in the ova of certain species of *Liparis*; on dimorphism of the female of *Dytiscus dimidiatus* (Bergstr.), and on the group of species allied to *Dytiscus marginalis*; on the morphology and biology of *Glyptomerus cavicola*, a blind beetle inhabiting caves; on eyeless Arthropods in Silesia. By Hr. Letzner: Contribution to the knowledge of *Trogosita mauritanica* (L.). By Eug. Schwartz: Diagnoses of certain species of *Cryptoccephalus*.

We hear that Mr. E. L. Layard, the well-known zoologist and author of *The Birds of the Cape Colony*, has been appointed H. B. M. Consul at Para. However satisfactory this appointment may be to Mr. Layard, it would have given us greater pleasure if a man of such scientific attainments had been located in a district whose fauna is less perfectly known than that of Para.

### Botany.

**Dispersion of Seeds by the Wind.**—A Kerner, of Innsbruck, reprints a very interesting paper on this subject, from the *Zeitschrift*

*des Deutschen Alpenvereins*. In order to ascertain the extent to which seeds are carried by currents of air, the author made a careful investigation of the flora of the glacier-moraines, and of the seeds found on the surface of the glaciers themselves, believing that these must indicate accurately the species whose seeds are dispersed by the agency of the wind. Of the former description he was able to identify, on five different moraines, 124 species of plants; and a careful examination of the substances gathered from the surface of the glacier showed seeds belonging to thirty-six species which could be recognised with certainty. The two lists agreed entirely in general character, and to a considerable extent also specifically, belonging, with scarcely an exception, to plants found on the declivities and mountain valleys in the immediate vicinity of the glacier—scarcely in a single instance even to inhabitants of the more southern Alps. M. Kerner's conclusion is that the distance to which seeds can be carried by the wind, even when provided with special apparatus for floating in the air, has generally been greatly overestimated; and this is very much in accordance with the view advanced by Mr. Benthams, in his anniversary address to the Linnean Society in 1869. Along with the seeds M. Kerner found, on the surface of the glacier, more or less perfect remains of a number of insects belonging to the orders Lepidoptera, Diptera, Hymenoptera, and Coleoptera, which, like the seeds, belonged almost exclusively to species which abound in the immediate neighbourhood of the glaciers. The species of plants which are especially inhabitants of the higher mountain regions may be divided into two classes. In the first the seed or fruit is provided with an appendage of various kinds, to enable it to be carried easily by the wind; the species possess generally a short space of life, are continually shifting their habitat, will grow where there is scarcely any soil, and especially love to establish themselves in the clefts or on the inaccessible sides of rocks; their floating apparatus appears designed rather to enable them to reach these habitats, where no other plants could establish themselves, than to be carried any great distance by the wind. The second kind are much more stationary, have a greater length of life, require a richer soil, are unprovided with any apparatus for flight, and can advance only very gradually; they are consequently much less abundant than the first kind. From the above observations, and the fact of the existence of detached localities for some of the mountain species in the Tyrolean Alps, very remote from their more abundant habitats farther south, M. Kerner draws the conclusion that at a period subsequent to the glacial epoch a warmer climate than the present over-spread that part of Europe, when the species referred to extended over a wide area, of which the present isolated localities are the remains.

**Mimicry in Plants.**—In the January number of the *Popular Science Review*, Mr. A. W. Bennett brings forward some remarkable illustrations of this singular class of phenomena, which he divides under two heads—those which relate to the whole habit and mode of growth, and those which refer to the development of some particular organ or part. Of the former kind a very familiar instance occurs in the extraordinary resemblance between the succulent plants which form so prominent a feature of the flora of the sandy deserts of America and Africa, belonging to the widely dissociated genera *Cactus*, *Euphorbia*, and *Stapelia*; and instances of this kind the writer thinks may generally be accounted for by similarity of external conditions. Far more difficult is it to explain the cases of "mimicry" which come under the second head, in which species growing either in the same or in different localities imitate one another to a marvellous degree of closeness in the form and venation of the leaf, the external appearance of the seed-vessel, or in some other particular organ. It appears impossible to suggest any explanation of this phenomenon like that which has been brought forward in the case of similar close resemblances in the animal kingdom, viz. "protective resemblance," springing up by the operation of natural selection; and these singular facts seem to deserve closer attention than they have yet received.

**New Fossil Conifers.**—Mr. W. Carruthers has figured and described in the number of the *Geological Magazine* for December 1871 two new species of fossil coniferous fruits from the Gault beds of Folkestone. He states one species to be allied to the existing *Wellingtonia*, and shows that they point to the existence of a coniferous vegetation on the high lands of the Upper Cretaceous period, which had a *facies* similar to that now existing on the mountains in the west of North America between the thirtieth and fortieth parallel of latitude. No fossil referable to *Sequoia* (or *Wellingtonia*) has hitherto been found in strata older than the Gault, and here, on the first appearance of the genus, we find it associated with pines of the same group that now flourish by its side in the New World.

## History.

*Correspondances intimes de l'Empereur Joseph II avec son Ami, le Comte de Cobenzl, et son premier Ministre, le Prince de Kaunitz*. Par Sébastien Brunner. Mayence: Kirchheim.

M. BRUNNER, the previous editor of two volumes of documents illustrating the reign of Joseph II., has now drawn from the imperial archives of Vienna a selected portion of the emperor's correspondence, the main body of which dates from 1782 up to February 1790, a few days before Joseph's death, and consequently covers the period of the residence of Pius VI. in Vienna, the emperor's visits both to Rome and to the Crimea, the Hungarian tumults, the Turkish war, and the revolt of the Netherlands. The predominant spirit of the volume—so predominant indeed that it comes out in every page, and may be said to give some effect of unity and sequence to an incomplete set of letters—presents itself to the reader at first sight. And this may be defined as an intense and narrow absolutism which led Joseph to make two factors only—his own will and the material at hand for executing it—the basis of political calculation, and at the same time to consider both nations and individuals in relation to himself to be nothing more than the pieces on a chess-board. This sentiment inspires one of the earliest despatches—that, to Cobenzl, then acting as his master's plenipotentiary at the congress of Teschen—in which Joseph, describing himself as “emperor and commander-in-chief of 300,000 men,” frankly designates the whole staff of the imperial government as “my tools.” And, turning to a letter written at the close of his reign, eleven years afterwards, we find a passage which strikingly presents the results of this thoroughgoing exercise of personal rule; speaking of his illness, he says that the firmest health must have given way under the burden of such troubles as his. “My whole situation,” he adds, “the retrospect of the past, the sense of the present, the foresight of the future—all this is as bitter as possible.”\* More than once during the intervening correspondence the self-same spirit shows itself fatal to the true statesman's keen and instinctive perception of adverse influences, as, for instance, in a letter dated at a time when the party of reaction against the Josephine reforms was gaining strong support and fresh impetus from the visit of Pius VI. to

Vienna in 1782. Joseph complacently sets forth how he contrives at once to show contempt for the pontiff's presence and to frustrate its object by forcing indifferent topics upon him during their interviews, to the exclusion of the serious matters at issue between them, and confidently prophesies that “in consequence” of this personal disrespect “the fable of the mountain and mouse will be exactly illustrated by the Holy Father's singular and pompous progress.” Yet events refused to justify a prediction which, even at its utterance, was falsified through one broad fact, unnoted by imperial egotism—the presence of Pius had stirred the heart of the people. The universal enthusiasm, the kneeling crowds, the distant populations which thronged the capital to see the face and take the blessing of their supreme spiritual ruler; all such plain tokens of that most vital danger to nascent reform—the evocation of a deep-seated and widespread popular reaction—were thrown away upon the revolutionary despot. Equal inability to estimate the sources and strength of a popular movement marks the correspondence throughout the earlier stages of the Belgian revolution. The patriots are judged as wild schemers whose plans, if not carried out on the instant, will certainly be abandoned by men shrinking at the after-thought of personal consequences; the memorial of the States of Brabant (June 30, 1787) is contemptuously mentioned; “les impertinences et la mutinerie” are the terms used for an organised national resistance, and farther on its obstinate vitality is characteristically set down to the break made in Joseph's personal government during his visit to Cherson. His letter to Kaunitz (October 4, 1787), though it takes note of one ominous sign, conveys the impression that he believed the movement dying out. A few days afterwards he wrote word to Catharine that the Belgian troubles were “coming to an end as ridiculous as their beginning.” In her reply the sharp-sighted czarina hinted pretty plainly her prevision that the end was by no means so near at hand. It was to come in reality, fraught with issues at that time unlooked for by Joseph, at the close of 1789. Tidings of the first congress of the new republic, and of its negotiations with foreign powers, reached him upon his death-bed. Writing from thence to Cobenzl (January 17, 1790), he declares that all along he has had no illusions, and that the event is just what he had foreseen; “that is to say, that there is not the least hope of dealing with these people except at the head of 80,000 men.”

Apart from the discussion of the Netherland affairs, the letters included in this volume, unlike those between Joseph and Kaunitz, from which M. d'Arneht has largely quoted, are provokingly brief and sterile in notices of public events. On the other hand, they fully illustrate the emperor's mode of government, especially his vehement and laborious activity in all matters, whether small or great, and throw useful light on his personal relations with his ministers. Details of espionage, a system of postal tampering, secret agency, hints suggesting petty jealousies and backstairs intrigue—these and such-like matters bring out strongly the meannesses of enlightened despotism. For Joseph himself the worst result of his personal government must have been this—that it was actually fatal to the development of bold and capable statesmen; for, as the correspondence advances, it clearly shows how the ministers whose office he had degraded to that of mere clerks of the closet—the men who were, as he says, mere “tools” and “instruments”—had in truth become such things as he accounted them, and, being such, were powerless for independent action in a state emergency. When this comes in the shape of the Belgian revolt, we see him unable to trust his advisers at home; his military and civil chief commissioners in the disturbed provinces, d'Alton and Trautmannsdorf, are

\* Dated December 5, 1789. Writing on the day following to Catharine of Russia, Joseph says:—“Ma situation, l'événement malheureux qui d'une façon aussi inconcevable m'a causé la perte des Pays-Bas, l'agression qui nous attend pour le printemps de la part du Roi de Prusse, tout cela est connu à votre Majesté impériale, et elle seule, qui connaît si bien l'amour pour l'État qui nous est confié, et les sentiments de l'honneur, pourra apprécier l'amertume mortelle de ma peine.” —*Joseph II. und Katherina II., ihr Briefwechsel*, d'Arneht, p. 346.

divided in action, and waste irreparable time in personal jealousies, while Count Belgiojoso's helpless incapacity in the crisis is sufficiently marked by Kaunitz (p. 135).

Records which bring out the bad points of an absolute monarchy rarely set the sovereign himself in a flattering light; and accordingly M. Brunner's fresh evidence is by no means in keeping with Gross-Hoffinger's well-known panegyric monograph of Joseph II. Indeed, it seems to reverse the picture, and we lose sight of his really noble qualities in view of the unpleasing traits presented of cynicism, arbitrary self-will, disregard for other men's feelings, tasteless parade of contempt for individuals—in one word, of habitual and manifold neglect of Montesquieu's maxim, that no prince should permit himself to put an affront on a subject. To his veteran chancellor he writes with some show of consideration; but the letters to his friend Cobenzl make a thoroughly disagreeable impression. Not only is their general tone harsh, rude, and imperious, but their style, slovenly to the last degree, gives the finishing stroke of disrespect for the person addressed. It may fairly be said that they stand in complete and grotesque contrast to the correspondence with Catharine, remarkable for its elaborate French, and still more elaborate flatteries. The closing letters, however, bear the impress of Joseph's truer and better nature, brought out by the touchstone of suffering and adversity. And his pathetic last farewell to Kaunitz reveals the royal patriot, of whom, notwithstanding all mistakes and shortcomings, it is justly written upon his grave that "Saluti publicae vixit non diu sed totus."

GEORGE WARING.

**Romanian Studies.** [*Römische Studien*: Untersuchungen zur älteren Geschichte Rumäniens. Von R. Roesler.] Leipzig: Duncker u. Humblot, 1871.

THE volume before us contains a series of researches tending to throw light on one of the obscurest points in European ethnology, the origin and early history of the Wallachian or Romanian nation—at present increasing in numbers and influence, and of no small interest owing to its close connection with the Eastern question. Not only Wallachia and Moldavia, but parts of Transylvania, Eastern Hungary, Bessarabia, and Bukovina are inhabited by a population which, although separated from all other neo-Latin nations, speaks a language which is clearly of Roman origin. This fact, in itself interesting, leads us to look for the connections which must have subsisted between the Romanians of to-day and the ancient people from whom they derive their language. From 106 to 272 A.D. Dacia, the territory now in possession of the Wallachian population, was a province of the Roman empire, and at least partly cultivated by Roman colonists. The Romanians themselves think it a point of patriotism to maintain their descent in a direct line from these colonists, whom they believe never to have quitted the soil of Dacia. This opinion has been generally adopted in Hungary and Germany. Mr. Roesler's researches have led him to a contrary conclusion: the book before us goes to prove that the forefathers of the present Romanians did not live in Dacia, but in ancient Moesia and other parts of the Hæmus peninsula, whence they migrated across the Danube to their present seats not much earlier than the thirteenth century.

The two first chapters of Mr. Roesler's book (I. The Getæ; II. The Dacii) may be called introductory, and give a survey of the ante-Roman state of things in Dacia, Thracia, and the adjacent regions. The way in which Mr. Roesler tries to solve the difficult problems connected with this part of ancient ethnology will greatly interest historians. The main interest of the book, however, lies in the third chapter, which

treats of the habitation of the Romanians in the middle ages. It is certain that Dacia contained a Latin or Roman population from 106, the date of occupation, till 272, when Aurelian relinquished the province and ceded it to the then wandering Teutonic nations, Goths and others. But it is no less certain that the Roman colonists of Dacia who would otherwise have been exposed to constant attacks from the barbarians, were conducted to the southern banks of the Danube and settled in the eastern part of Moesia and the so-called Dardania, which consequently received the names of Dacia Nova, Dacia Ripensis, or simply Dacia, and, as might be expected, was not rarely mistaken for the former Dacia. Mr. Roesler thinks that the evacuation of Dacia was a complete one, as far as such a migration can be complete. Some few of the Roman colonists may have remained, but not in such numbers as to give a right to speak of a Roman population resident in Dacia after the province had been abandoned. His principal authority is Flav. Vopiscus, *v. Aurel.* 39: "cum vastatum Illyricum ac Moesiam deperditam videret, provinciam Transdanuvinam Daciam a Trajano constitutam *sublato exercitu et provinciis* reliquit, desperans, eam posse retineri abductosque ex ea populos in Moesia collocavit appellavitque suam Daciam quæ nunc duas Moesias dividit." In opposition to this statement Wallachian historians firmly assert that the major part, or at least a considerable portion, of the colonists remained in Dacia, either taking refuge in the mountainous parts of modern Transylvania, or living in some degree undisturbed among the barbarians. This assumption, though not backed by any authorities, is in itself consistent, but—and this is the strongest point of Mr. Roesler's argument—there is not a single fragment of historical evidence proving the existence of a Romanian people from the third to the thirteenth century. We look for a Romanian nation and find none, at least not there where it is supposed to have lived during that period. Yet the history of those countries, although far from being accurately known, is by no means so obliterated as to explain this marvellous fact. We know the different nations that occupied and for a time inhabited the soil of Dacia, one after the other—Vandals, Goths, Huns, &c., lastly Slavonian tribes and the Hungarians, but no mention is ever made of a Wallachian or Romanian population. Neither Constantine Porphyrogenetos, the best authority for the ethnology of the trans-Danubian countries, knows anything of them, nor are the "Vlachove" of Nestor, the Russian chronicler, the modern Wallachians, but the Franks of the Carolingian empire. Nor when near the end of the eleventh century Transylvania became a Hungarian province are any traces to be found of the former Roman colonists supposed to have taken refuge in that country. On the contrary, the Hungarian kings thought it necessary to invite a large number of German colonists into their new province, a measure quite incomprehensible if there existed a population of Latin tongue in possession of the soil, and moreover, as Wallachian historians assert, far more advanced in civilisation than their neighbours. Further, when Bruno (about 1007) preached the Gospel in the then Petchenegian districts of modern Moldavia, he complains of the people as of the worst of heathens. "How would his heart have been gladdened if he had detected in the midst of the hostile Petchenegs a numerous Romanian population, entirely unknown to the west of Europe, a people who had shown courage enough to defend their Christianity against the heathens through many centuries." But Bruno knows of no such people, much less of an organized Christian church with priests and bishops, supposed by Wallachian authors to have been then in existence. No mention of a Romanian church is found

earlier than the fourteenth century. These arguments *ex silentio* could be considerably increased, and we think them sufficient to give Mr. Roesler a right to dispute the opinion hitherto prevalent about the origin of the modern Wallachians, and to conclude that their original seats are to be looked for elsewhere.

Besides, the positive side of the question can be as satisfactorily answered. At the present day we find a numerous Wallachian population (the so-called Zinzars, Kutzo-Wallachians or Macedo-Wallachians) south of the Danube; spread over Greece, Albania, Thessaly, Western Macedonia, and Thrace, speaking a language differing only dialectically from the Wallachian tongue of Wallachia properly so called. The population can be traced back as far as the sixth century. The name of Βλάχοι is for the first time found in Georg. Cedrenus (976) to denote the modern Macedo-Wallachians. Benjamin of Tudela found a Wallachian population in Thessaly. The second Bulgarian empire (1186) was founded by Wallachians and Bulgarians in common. "These Wallachians were the remnants of the former Roman population in Moesia, combined with those Roman colonists who, emigrating from Dacia, had inhabited the cis-Danubian territories before mentioned since the third century."

The result of these researches is: that from the sixth century up to the present day there is no lack of evidence to prove the existence of a people speaking a Latin tongue south of the Danube, while no authority can be cited to prove the existence of the same people north of this river. Everybody would be inclined to draw the conclusion that the Romanian population now resident in Wallachia, Transylvania, &c. came from the other side of the Danube. To make this conclusion a certainty, the strongest factor remains to be mentioned—the Romanian language. If the ancient colonists of Dacia had remained in uninterrupted possession of the soil, their language must necessarily show some traces of the many idioms that have passed over the same soil. But the modern Wallachian tongue of the Danubian Principalities contains no German (Gothic) words, while expressions borrowed from the Hungarian are comparatively few and modern. On the other hand, the language is full of Greek and Slavonic elements. How could a considerable number of Greek words invade a language spoken in Dacia?—a fact easily to be explained if the people formerly inhabited the Hæmus peninsula. Of still greater importance is the Slavonic part of the Wallachian vocabulary. The Wallachians are now in contact only with the Russian (Ruthenian) population of Hungary, Bukovina, and south-western Russia, and are separated from the Bulgarians by the Danube. But the above-mentioned Slavonic elements bear marks of a Bulgarian, not of a Russian origin. Until the seventeenth century, the Bulgarian language was the only one used by government and the church. We think it evident that all this can only be explained by adopting Mr. Roesler's theory.

We have dwelt somewhat at length on this third chapter, believing it to be the most interesting, and to contain the most striking evidence, and must treat the remaining chapters in a cursory way. The fourth chapter is intended to destroy the authority of the so-called Anonymous Notary of King Bela, constantly cited by Wallachian and Hungarian authors as a trustworthy witness to their earlier history. Mr. Roesler has added to the doubts which have often been urged against the veracity and trustworthiness of this chronicler; and we think it very improbable that any serious historian, not blinded by exaggerated patriotism, will accept the accounts of the Anonymous Notary when unsupported by other authorities. The fifth chapter treats of the ethnological

position of the Bulgarians, which we pass over as not closely connected with the main question. Chapter vi. (The Earlier History of the Wallachian Voyvodship) and vii. (The Commencement of Moldavian History) may be called a continuation of the third chapter. The author tries to disentangle the history of the two countries from the fictions of old and recent Romanian historians, who have endeavoured to fill up the void between the third and thirteenth centuries with inventions of their own. A longer article would be necessary to give the reader an idea of the minute detail connected with these researches, and we must be content to remark that the same considerateness of judgment and a strictly historical method which pervades the whole volume make the views of Mr. Roesler in the highest degree acceptable, even to those who cannot follow him in comparing the original documents, if they deserve that name, of Wallachian history. Undoubtedly, Mr. Roesler's book will contribute not a little to clear and rectify the views both of historians and of the public at large concerning the Wallachian people.

One thing we may be allowed to add. It is to be expected that Romanian writers will be very indignant at the results of Mr. Roesler's researches. But they may be consoled. If it must be denied that the modern Wallachians are the direct descendants of the ancient Roman colonists of Dacia, still another fact is undeniable: they are a people surpassing their neighbours in fecundity and power of assimilation, who have attained their present number of seven or eight millions in a comparatively short period, and spread its population by colonising and Romanising to a marvellous extent. In such circumstances exalted patriotism may wish for a noble descent and a glorious history, but such are certainly of little value in the present and future development of the nation.

A. LESKIEN.

#### ÉCOLE LIBRE DES SCIENCES POLITIQUES.

THE want of systematic instruction in the various branches of political science is one of the most serious defects in the higher education of France as it is in that of our own country. The existing courses on political economy and law lose much of their value by being dispersed over a number of centres, such as the École de Droit, the Collège de France, the Conservatoire des Arts et Métiers, the École des Chartes, &c., besides being deficient in many important subjects, and treating the rest in a piecemeal and arbitrary manner. To supply a new want which seems to have sprung up since the war, a number of publicists and others have combined to deliver in Paris, under the auspices of MM. Boutmy and Vinet, a systematic two-year course, beginning in the present month. The complete programme embraces ten subjects:—1. Geography and Ethnography. 2. Diplomatic History of Europe since the Peace of Westphalia. 3. Military History of Europe since Frederick the Great. 4. History of Political Economy since Adam Smith. 5. History of the Progress of Agriculture, Industry, and Commerce in Europe and America during the present century. 6. Financial History of Europe since the French Revolution. 7. Constitutional History of Europe and America since 1776. 8. History of European and American Legislation since the Civil Code. 9. History of Administration in Europe since the seventeenth century. 10. Moral and Social History since 1789.

Under the last head it is proposed to give something like an account of political theory, without which—and we may add a systematic examination of the structure and functions of the social organism, in the light of biological and psychological science—no course can be complete.

Among the professors who will commence at once are—MM. Gaidoz, Sorel, Dunoyer, Levasseur, Janet, and Leroy-Beaulieu. The students who desire a diploma at the end of their two-year course may present *theses* to be examined by MM. Passy, Franck, and Laboulaye.

Nothing can be more important than such an enterprise as this if efficiently and *strictly* carried out in a scientific spirit.

EDITOR.

### Intelligence.

Prof. Wilkins, of Owens College, has published a Cambridge prize-essay on *Phœnicia and Israel* (Hodder and Stoughton), "which aims at gathering into a focus the scattered rays of light that we have from many quarters upon one of the most powerful influences that tended to mould the character of the Chosen People" (p. x.). The book is written in a clear and flowing style, and usefully supplies a gap in our historical literature. Its grand defect is that it is based on authorities which, however eminent, are now in many respects antiquated, or at any rate stand in need of a searching sceptical criticism. Something better was needed for a worthy treatment of the subject than a superficial *résumé*, acceptable as even this will be to many readers, of Movers, Ewald, Renan (not Rénan), and Lenormant; and it shows a surprising ignorance of the difference between the prophetic and the historic Scriptures to describe every attempt to restore the order of the former as "confident dogmatism" (p. 165).

Dr. Kiepert's new map of Epirus and Thessaly (price five shillings) has received well-deserved praise for its severely critical treatment of heterogeneous materials, ranging from the surveys of French engineers to sketches illustrative of the routes of travellers. The same able cartographer has brought out a new map of European Turkey (price nine shillings).

### Contents of the Journals.

*Bullettino dell' Istituto* (Nov.) continues the account of the excavations in and about the Basilica Julia, and of those at Pompeii. One of the frescoes at Pompeii depicts the mission of Niptolemus, and the first sowing of corn.

*Revue Archéologique* (Nov.) gives "Amphiarus" as a specimen article of the new *Dictionnaire archéologique* in preparation by Hachette and Co., the special characteristic of which is the very full employment of monuments, vases, &c., in illustration of the statements made by ancient authors.—An article on Philo's Contemplative Life goes over much the same ground as De Quincey's article on the Essenes, but comes to an opposite conclusion.—Three new inscriptions from Thera afford instances of the *heroa* so commonly dedicated by the leading families. The tombs in the necropolis of Marzabotto, in the Apennines, on the road from Bologna to Pistoia, are shown to contain some Gaulish relics mixed up with the Etruscan, the type being that of North Gaul. Did they belong to the Serones who immigrated into this district?—De Saulcy comments on some Palmyrene coins lately found. The Turkish government has garrisoned the place, and checked back the Bedouins, so that it is now possible to explore the country.—The year's work in the department of the Seine is described: of the Roman age, a theatre has been found at St.-André-sur-Cailly, and a grand mosaic at Lillebonne; of the Frank, some jewels of gold, and a coin of Theodebert I.; of later times, the statues of the Plantagenets in the cathedral of Rouen, and the tombs of the Bishop of Orkney and the Scotch nobles who were sent to negotiate Mary Stuart's marriage with the Dauphin, and died at Dieppe.

Gött. gel. Anzeigen, Dec. 6.—Earle's Philology of the English Tongue is reviewed by Pauli more favourably than has been the case in England. Dec. 13.—Scheurl's Letters are noticed by Geiger as illustrating the career of those Humanists who went with Luther a little way, and then recoiled. They also illustrate the state of things at Nuremberg.—Liebrecht analyses the second part of the *Filologia e Letteratura Siciliana*, which gives an account of many mystery plays, and of some of the chronicles about John of Procida and the Sicilian Vespers.—Dec. 27.—Contains one of Geiger's series of articles on the Humanists—in this case John Butzbach, a monk of Laach, and his History of a Scholar's Wanderings, which gives a curious picture of the poor scholars of the time. Mahaffy's *Prolegomena to Ancient History* are praised and the contents analysed, attention being drawn to the criticism on Thucydides' method of accounting for all historical facts on mere political grounds, passion and chance being almost excluded. Benfey's review of Bleek's *Reineke Fuchs in Afrika*, and Köhler's review of Zingerle's *Tyrolese Children's Stories*, add something to our materials for this new branch of comparative science.

*Literarisches Centralblatt* (Dec. 9) notices several books on the late war, and especially praises Forbes' book.—An account of some critical editions of Schiller's works follows. Dec. 16.—Scheffer-Boichorst's reconstruction of the Annals of Paderborn is praised and upheld against Waitz' objection of "being overbold."—A notice is given of Kiepert's new maps of Greece, and of the authorities on which they are based.—Ahlwardt's account of the Arabic MSS. at Berlin is praised, especially for the notices of the poets.—Some corrections are supplied for Keil's edition of *Dosithei Ars Grammatica*; and Kühnast's excellent book on the Syntax of Livy is well characterized.—Dec. 30.—Contains a notice of the thirtieth volume of the *Fontes Rerum Austriacarum*, which collects the Venetian ambassadors' despatches from Germany, of which Ranke has made so much use. The volume

unfortunately only gives those which now exist at Vienna, thus excluding some of Ranke's chief authorities. Trieber's *Enquiries into the History of the Spartan Constitution*, which is really an enquiry into the sources of our knowledge about Sparta, is reviewed unfavourably in some detail by Bucheler.

*Theologisches Literaturblatt* (moderate Roman Catholic), Dec. 4, gives a summary of the "Old Testament literature" of the year, by Reusch.—Knittel reviews Maywald's book on the "Twofold Truth" (*i.e.* a regulative religion for the people, an inner philosophical meaning for the educated) as a theory of the middle ages.—A notice follows of Joel's book on the connection of Spinoza's ideas with those of previous Jewish teachers.—Loersch's *Aachener Rechtsdenkmäler aus dem 13., 14. und 15. Jahrhundert* is praised as illustrating the manifold development of the town constitutions of Germany in the middle ages, which must be investigated separately, general propositions about them being very fallacious. Dec. 18.—Reviews the last part of Winter's book on the Cistercians in North Germany, which shows the inevitable decline of the order. The reviewer naturally thinks the case against them somewhat overstated.

### Philology.

#### THE PRONUNCIATION OF LATIN.

##### VIII.

##### The Letter V.

1. PROFESSOR MAX MÜLLER's article on the Latin letter V, in the *Academy* for December 15, vol. ii. p. 566, induces me to add a few supplementary observations to my former remarks (*Academy*, April 15, p. 231), bearing especially on the confusion of the mixed dental and labial forms *f*, *v*, as used in English, with the pure labial forms, which I shall continue to write *f*, *v*, and of these latter consonants with what may be termed the mixed lingual and labial English forms *wh*, *w*.

2. In my *Early English Pronunciation*, p. 518, I note that "the letters β, φ," in modern Greek, "seem to be naturally pronounced by Prof. Valetta as *v*, *f*, but when he became particularly emphatic, he made them *v*, *f*," that is, his lower lip involuntarily struck the upper teeth. Again (*ib.* p. 549), I note with respect to Mr. Magnússon's Ice-

landic pronunciation, "V is *v* with so slight a contact of the lower lips with the upper teeth as to vary in effect at different times as *v*, *v*," and Mr. H. Sweet adds, referring to Mr. Hjaltalín's pronunciation, "I thought at first that V was *v*, and I was only induced to consider it as a *v* by the distinct statement of Mr. Hjaltalín that it was a dental sound." Previously (*ib.* p. 542), I note of Mr. Magnússon's F that it is "properly *f*, with a very mild hiss, scarcely more than a single tooth being touched by the lower lip, so that it approaches *f*." It has this sound only at the beginning of syllables, or before S, or when doubled. At the end of a word it falls into an equally mild *v*." Again (*ib.* p. 549), I remark "that V was not originally *v*," in Icelandic, "is clear to me from the combination HV, which is called *wh* in the southern and *kw'h* in the northern districts of Iceland," of course according to Mr. Magnússon's oral information, *kw'h* representing the simultaneous and not successive pronunciation of *k* and *wh*, or rather a sound bearing to *kw*, the labialised *k*, the same relation as *kh* does to *k*. According to Mr. Melville Bell, for whose notation of Mr. Hjaltalín's pronunciation I am indebted to Mr. Sweet, he heard V, F as *v*, *f*, and both HV and KV as *k* + *wh*, which indicates a very unusual sequence, the ordinary recognised form being *kh* + *w*, which is in Scotch and Welsh rather *kw'h*. As a correction of my statement in the *Academy*, vol. ii. p. 231, col. 2, line 3, respecting Welsh pronunciation, I have lately been informed by a South Welshman who can pronounce *wh*, but is not always clear on *w*, that the Welsh CHW is not *wh* in South Wales, but *kw'h*, or, as he conceived it, *kh* + *oo*, as in the north.

3. Lepsius (*Standard Alphabet*, 2nd edition, 1863, p. 75) says: "We ought perhaps to notice here the particular pronunciation of W in Middle Germany, where this letter is no *labio-dental*, formed between the lower lip and the upper teeth, as V in England, France, Northern Germany, India, &c., nor the *semivowel* W of the English, Arabic, and many other languages, but a pure *labial* sound, formed between the upper and lower lip without any *oo*-position" (in order to avoid theories respecting Latin sounds I use the common English representation of vowels, and hence transliterate Lepsius and other writers, where necessary) "of the lips and tongue, and without any concurrence of the teeth. This is, however, a sound which *I never heard of in any language*" (my italics), "except the provincial German dialects, and for this reason it needs hardly a peculiar designation in our alphabet, where, if wanted, it might be written," with a dash under a *w*. Lepsius accordingly gives *f*, *v* in Japanese and Magyar, of which hereafter (see Nos. 7 and 8). Dr. Brücke, himself a Lower Saxon, from the northern seaboard, writing in Vienna (where every one says *f*, *v* and not *v*), says (in his *Grundzüge der Physiologie und Systematik der Sprachlaute*, 1856, p. 111), respecting my having called *v* the German W in a previous work, that I hold it "erroneously" (*irrthümlicher Weise*) for the usual German W, and (*ib.* p. 34) says that *v*, "the V of the French and English," is the usual German W, but that *v* occurs where *qu* is written, as in *Quelle*, *Quirl*, *quälen*, sounded with *kw* for *qu*. He also says (*ib.*, here translated), "We can also produce an *f* by making the narrow passage through which the air has to rush in order to produce the characteristic fricative noise of a consonant, without employing the teeth, but merely by approximating the lips. This *f* is somewhat softer (*milder*) than the usual *f*, and is used by many people where we write a V in German (*wird von manchen Leuten da angewendet, wo wir im Deutschen ein V schreiben*), whereas the majority do not distinguish F and V." That is, Dr. Brücke recognises, at least dialectically in Germany, *f* for F, *f* for V, and both *v* and *v* for W. As regards Dutch, Dr. Gehle,

minister of the Dutch Reformed Church in Austin Friars, in the City, told me that the alphabetic names of the Dutch U, V, W are *ue* (as in German), *vai*, *v'ai*. Heknew the English *w* quite well, and observed that all Dutch children in saying their alphabet made this distinction. Merkel (*Physiologie der menschlichen Sprache*, Leipzig, 1866, p. 209, here translated) professes that he cannot at all understand Lepsius' assertion just cited that *v* is "provincial." "We Middle Germans," say he, "have certainly as much right to call the abnormal (or aberrant, *abweichende*) formation of W by North Germans, English, and French, provincial or dialectic, as conversely. Persons, too, that have lost their upper teeth have also, I hope, a voice in this matter." "Persons with no teeth at all can pronounce W = *v* as distinctly as those with a full set." Merkel distinctly recognises *f* in German, writing it V, asserting that it is used in whispers for *v* or W, and (p. 210) that this is the form assumed by F in the High German PF, which combination, he thinks, was the original Greek *θ*, of which opinion perhaps the Japanese treatment of the aspirate (below, No. 7) may be found to give a confirmation. But after fully recognising *f*, Merkel comes to the following very curious result respecting *v* (as distinct from *v*), which I recommend to the serious consideration of those who find *v* the only natural sound (*ib.* p. 212). "The sound *f* cannot be vocalised, that is, united with vibrations of the vocal chords, without change of position (*als solches*). The organs could not help (*müssten*) assuming in the attempt (*dabet*) an intermediate position between that of *f* and that of *f*, and separating so far that no sensible (*erheblich*) noise can result. In this way, on vocalised breath passing, a sound is produced which is scarcely distinguishable from the usual *v*, and for which the two lips are not exactly opposed (*nicht genau einander gegenüber stehen*), the lower lip being slightly retracted under the upper lip. It would be superfluous to have a distinct written symbol for this *v*, which, according to Brücke, is the usual one in German, French, and English." Accordingly he uses only V, F, W, V for *f*, F for *f*, and W for *v*, and also for this peculiar *v*, which is certainly unknown in England, whereas he is himself unable to pronounce (and notwithstanding his laborious physiological investigations apparently to conceive) the common English buzz *v*. All who wish to see how national habits cloud phonetic apperceptivity should read Merkel's observations on these letters (*ib.* pp. 208-213). Prof. Haldeman (*Analytic Orthography*, 1860, p. 102) truly says: "There is no certainty in the accounts of English V and German W occurring in exotic languages, for when either is mentioned, we have no proof that the observer knew the difference. For example, although the modern Greeks asserted in the most unqualified manner the identity of their *β* with English V, they were in error, and it has been but a few years since this question was settled. In a similar manner, the Spanish grammarians are still mystified about their B and V." Prof. Haldeman, it should be observed, strongly advocates the *w* sound of Latin V (*Elements of Latin Pronunciation*, Philadelphia, 1851, pp. 34-36).

4. The mention of Spanish B and V by Prof. Haldeman should be taken in connection with Prof. Max Müller's remark (*Acad.* Dec. 15, p. 567, col. 1, (2)), that *v* is "uniformly adopted in . . . Spanish . . ." Now, Prince Louis Lucien Bonaparte, whose accurate phonetic knowledge of living languages is rather uncommon, and who has had much opportunity of studying Spanish sounds, supplementing my observations upon them (*E. E. P.* p. 802, note 2), tells me that Spanish B and V are two signs, each of which represent the same one of two sounds under the same circumstances, so that it is a matter of perfect indifference, so far as the written form is concerned, which letter

is used. When B or V is written where BB\* occurs in Italian, a clear *b* is sounded. Where B or V is written after a consonant, a clear *b* is also sounded. But where B or V is written at the beginning of a word (and not following a word ending with a consonant, on account of the preceding rule), or after a vowel in the middle of a word, the sound is always *v*. Compare *Ortografia de la Lengua castellana compuesta por la real Academia española* (Madrid, 1792), where, after acknowledging (p. 27) that B and V are commonly pronounced alike, it says that the proper mode of pronouncing V is "by striking the lower lip, accompanied by the tongue, against the upper teeth, as in case of F," an entirely theoretical direction, as is apparent from the long rules given for determining when B and when V should be written, and from the needless introduction of the tongue, as in case of my Hungarian (below, No. 8).

5. Prof. Max Müller learns from Mr. Rhŷs that Welsh possesses both *v* and *w* (*ib.* p. 567, col. 2; see also *Acad.* May 1, p. 256, col. 1). Welshmen who have learned English, more or less accurately pronounce *w*. My own impression is that in unalloyed Welsh *w* is unknown, having always remained a simple *oo*.† It is a point that requires clearing up by English ears and Welsh mouths. Ask Welshmen who cannot speak English to repeat: *Would ye yield the woman Wood wooed?* Even those long used to English find a difficulty with *woman*. The vowel *oo* is lingual and labial; the back of the tongue is raised nearly into the *k* or *g* position, the lips are closed nearly into the *w* position. English people naturally assume the *w* position when a vowel follows. That other nations do not, they may hear by attentive and often repeated (not casual) listening to such words as the Italian *uomo*, *uopo*, and the French *ouais*, *ouate*, *ouest*, *oui*, as contrasted with the English *wa(r)m*, *wa(r)p*, *way*, *waitle*, *west*, *we*. (The last scene in *Le Duc Job*, as performed by the Comédie Française in London last summer, offered an excellent study of *oui*.) To say *w* the lips approach nearer, spoiling the resonance by which alone the vowel quality *oo* is possible, and the greater effort necessary to produce a buzz, in which vocalised and unvocalised breath contend, drives out the lips all round the aperture, especially the parts of the lower lip on each side of the medial line, the breath being directed downwards by the position of the tongue. But on reassuming the clearly resonant position *oo*, after pronouncing *w*, we are able to say *w-oo*, a sound which is the despair of all Europeans who

\* Double consonants are not used in Spanish, except as digraphs to represent new sounds, as *rr*, *ll*, and *nn*, the last being now usually written in the contracted form *ñ*.

† Salesbury, 1567, asserts Welsh W to be always a vowel, and considers of course English W to be so also (see *E. E. P.* p. 761—the spelling is here modernised): "In English ye call it double *uu* and in Welsh we give it the name of a single *u*, but then sounding it after the Latin pronunciation, or else as you now sound your *oo*: . . . being always either the further or the latter part of a diphthong in English, on this wise: *with awe*, and in Welsh as thus: *wyth awen*." The following observation of Salesbury bears on the transformation of this *oo* into a consonant: "And though I find in some ancient writers 6 for *vv*, yet in other I find *vv* in words now usually written with *v* or *f* as *cithavv*, for *cithav* or *cithaf*. In which kind of words, because they of South Wales use yet to keep the pronunciation of it" (Salesbury was from Denbigh in North Wales), "saying *lavvly* where we say *lavlu* or *lavfu*, I do rather use for the more indifferency to write *v* than *f*, even that they may the more aptly resolve it into their wanted vowel *vv*, and we may sound the same after our more consonant acceptation." The received notion of the pronunciation of Welsh F is *v*. It would be worth while ascertaining after this statement whether *v* be not the real sound used by those who have not learned English. This is the more interesting as F appears as an initial mutation of B, and M, as in *eu buruch*, *dy furuch*, *fy muruch*, their, thy, my cow, where the teeth seem out of place. Does the mutation PH in Welsh differ in sound from the radical FF, as in *ei phen*, her head; *ffen*, the flowing principle? and if so, how? as *f*, *f*, or as *p*, *h*, *f*?

are not English. There is, however, another mode of making *oo* into a consonant. The lips may remain in the *oo* position, but the tongue be brought up to the *k* position, which being vocalised gives a *g*, modified however by the rounded lips into *gw*, that is the simultaneous utterance of *g* and *oo*.\* Now, in Welsh there are a very few words written with W followed by a vowel, such as: *wab*, a slap; *wedi*, then; *weithian*, now; *weithiau*, sometimes; *wel*, well; *wela*, look; *wi*, hey! *wihi*, whinny; *winc*, chaffinch; *wo*, wo! *wy*, of him; *wybr*, sky; *wyd*, thou art; *wyf*, I am; *wyl*, a flow; *wylo*, to wail; *wyn*, lambs; *wynob*, face; *wyr*, a grandchild; *wyrain*, spreading; *wysg*, presence; *wyt*, thou art; *wyth*, eight, and their derivatives; in all of which I think rather *oo* than *w* will be heard when actually tested. But *gwa*, *gwe*, *gwe*, *gwi*, *gwu*,† *gwi* begin hundreds of words, while *gwu* and *wu* are never found. Of course, *g* falls out, and *w* resumes its vowel power in initial mutations. I believe, therefore, that I am right in saying that no extra-Anglican European lip is now familiar with *w*. The diphthongal use of *oo*, *ee*, requires careful discrimination from the consonantal use of *w*, *y*. Almost all writers confound the final elements of the diphthongs in *my cow* with *y* and *w*. Yet these final elements are, in English, neither *y*, *w*, nor *ee*, *oo*, but that peculiar modification of *ee*, *oo*, heard in *bit*, *foot*. The effect of a diphthong is produced by running one vowel on to another in a *glide*, or *variable sound*, resulting from continuing to utter vocalised breath while passing from one vowel position to the other. For the true effect of the diphthong one of the terminal vowel sounds must be shorter than the glide. In *my cow*, the first element, which is the same in both words, has the stress and is remarkably brief; the second element is often very long, and has no stress; the glide is intermediate in length. The prolonged second element bears no resemblance to a prolonged *y* or *w*. But the glide from the first to the second element is identical with that leading from the first element to *y* or *w*. The syllables *āy*, *āw*, can be pronounced after some practice, quite distinct from the diphthongs themselves, ending with as pure a buzz as *āaz*, or *as*. The initial short and stressless elements *ee*, *oo*, do not occur at the commencement of diphthongs in English, as, to my ears, they do in Welsh, and as they may once have done in Latin. If you say *ēe* + glide + *āa*, *ōo* + glide + *āa*, the effect to one accustomed to *y*, *w*, is *yaa*, *waa*, and at most, after two or three hearings, he may say, you pronounce *y*, *w*, imperfectly and rather thickly, rather French fashion, and not quite like an Englishman. The very brief *ee*, *oo*, differ so slightly from the very brief buzzes *y*, *w*, that, since the glides in the former and latter cases are identical, it requires considerable practice for the ear to discriminate them sharply. And yet, in point of fact, those who habitually begin with *ēe*, *ōo*, seldom learn to begin properly with *y*, *w*, and conversely. It is only by such testing instances as *yec*, *woo*, which cannot commence with *ēe*, *ōo*, that the fact is brought out. This being the case, those nations who use *ēe*, *ōo*, habitually give them consonantal syllabic value. This is remarkable in French. There is no doubt that in *Richelieu*, the *li* is *lee* short and not *ly*, yet the *e* in *Riche* is always pronounced, just as if its omission would have brought the three consonants *ch* + *l* + *y* together, an almost inadmissible combination in French speech. By omitting the glide, the diphthongs are resolved into two vowels, and the shortest element then generally gains in length. An accurate knowledge of diphthongal formation is indispensable in the present enquiry.

\* This relation of *oo* to *gw* explains the alliteration of G and W in Anglo-Saxon, noted as frequent by Dr. March (*Anglo-Saxon Grammar*, 1871, p. 224, end of art. 504).

† In Welsh, U is not *oo*, but a peculiar modification of *e*.

6. In Arabic, so far as I can recollect from the instruction received from three natives many years ago, *w* is used. But I have had no recent opportunity of testing the point. It is a significant fact that written *woo* becomes spoken *oo* in Arabic. Turks are said to have *v* and not *w*, and to pronounce imported Arabic words, like *visier*, with *v*. It is worth testing for *v*. Arabic leads naturally to Hebrew, but the pronunciation of the latter is entirely theoretic, and there may have been original differences between the two, similar to those between Welsh and Gaelic, or Low and High German. The system of pointing introduced in later times leads to the supposition that at least at that period *ב*, *ו*, *י* may have been *b*, *v*, *w*, and *א*, *א*, *p*, *f*. Arabic is said to have *f*. After some recent experience, I feel doubtful of all assertions respecting *f* as well as *v*. Certainly *f* is a comparatively rare sound, and *f* may prove more common than is generally supposed. Although, on a casual hearing, especially of foreign words, an Englishman naturally assumes *f*, *v*, in place of *f*, *v*, even if the latter be really pronounced, nothing is easier than to test by the eye, and to put the question whether the teeth are touched or not by the lower lip. A wide examination of existing languages, dialectic European, and especial extra-European, is here advisable, as the following observations will show, which I have had an opportunity of making within the last few weeks.

7. Two young Japanese, one of whom speaks English well, were recently kind enough to go through the Japanese syllabary with me. The five Japanese vowels are, as nearly as possible, those heard in the English words *baa*, *beer*, *boor*, *bear*, *bore*, the last four being slight modifications (produced by the action of the R) of those heard in *beet*, *boot*, *bate*, *boat*, and we may therefore write them for the present purpose, *aa*, *ee*, *oo*, *ai*, *oa*. To each of these the same consonant is prefixed in the syllabary, and the compound effect is represented by a single sign. One set of five syllables is supposed to begin with *h*. The sounds *haa*, *hai*, *hoa* were heard truly as in English *hart*, *hair*, *hoar*. But in place of *hee* I heard a sound which at the time I took for *ky'h* (or *ch* in the German *ich*, *Mädchen*), but which I am on reflection inclined to suppose was *yh* (the English *h* in *hue*), or, very nearly, unvoiced breath forced through the *ee* position. German writers all confuse *ky'h* and *yh*, but they are really as distinct as *ku'h* and *wh*, and bear the same relation to unvoiced *ee* as the latter do to unvoiced *oo*. We should then have expected *ku'hoo* or *whoo* in place of *hoo*, but the real Japanese sound was distinctly *f'oo*. The speaker from whom I heard the sound had very projecting upper teeth, so that Englishmen would naturally suppose his lip could scarcely avoid them. But on the contrary, he had experienced great difficulty in acquiring the English *f*, and in distinct language repudiated any contact with the teeth. Yet Lepsius gives this sound as *f* (*ib.* p. 246), although Dr. Hepburn (*Japanese Dictionary*, 1867) recognises *f'*. In Aberdeen there is a well-known peculiarity of pronouncing *f* for *wh* in *faar'*, where, *faa*, who, &c. Is this really *f* or *f'*? In England where we ought to have had *whoo*, *whoom*, &c., we have reversed the Japanese habit, and substituted the simple *h*, as *hoo*, *hoom*. These two exactly contrary tendencies should be well weighed by those who would determine a sound by "natural" in place of "national" relations. The following shows another national tendency. Dr. March (*ib.* p. 5) says that Anglo-Saxon HW is like *wh* in New England. In a private letter to me he says: "A clear and distinct *h* before the *w* hardly attracts the attention of a New Englander," and Mr. Bristed confirms the remark. As however *h* + *w* presents many difficulties, I ventured to suppose that the real sound was our *wh*, and Dr. March obligingly tells me: "In my own pronunciation of *which*, I set the lips for *w*,

then untuned breath is issued, then the parting of the lips and general movements of the organs which I have taken to be the *w* is made." That is, he says *wh* + *w* + *ich*, in place of the simple English *wh* + *ich*. This is also Professor Haldeman's analysis (*Anal. Orth.* p. 127, art. 602, line 2). It is similar to the usual German *s* + *z* + *ee* for *sie*, as compared with the English *z* + *ee* for *zeal*. In ordinary English we have the reverse at the end of a clause as *hiz* + *s*, *breedh* + *th*, *haav* + *f* for *his*, *breathe*, *halve*. But the value of this example depends on Dr. March's subsequent observation: "The surd breath issued before the opening movement of *w* is what we New Englanders call *h*." That is, before *oo* the Japanese consider *f'*, and before *w* the New Englanders consider *wh* to be the simple aspirate. Both have been generated by a following letter presenting effectively the same position of the organs. It can only be national as opposed to natural tendencies which generate *f'* in one case and *wh* in the other. In England we have certainly *f* in *laugh*, *draft*, *dwarf*, where there is nearly historical evidence that the process of derivation was *g*, *gh*, *gu'h*, *wh*, *f*, *f*; compare also the Icelandic treatment of *g* (*E. E. P.* p. 312 and p. 543). The Japanese *p* series seemed to be post-aspirated in *p'haa*, *p'hee*, *p'hoo*, the two latter not becoming *py'hee*, *pf'oo*, as might have been expected, and similarly *k'haa*, *k'hee*, *k'hoo*, not *ky'hee*, *kf'oo*; but this postaspiration may have been a personal peculiarity. Such undoubtedly was the pronunciation *baa*, *v'ee*, *v'oo*, *bai*, *boa*, which was corrected by the other speaker, whereupon the first said *bee*, *boo*, but he subsequently, and clearly habitually, fell into *v'ee*, *v'oo*. The *w* occurred only in *waa*, the simple vowels *ee*, *oo*, *ai*, *oa*, were substituted for *wee*, *woo*, *wai*, *woa*, showing probably a Japanese orthoepical difficulty. There seemed even to be some peculiarity about this *w* in one of the speakers. Again *yaa*, *yoo*, *y'oa* were said, but *yee*, *yai* sank into *ee*, *ai*, also probably from orthoepical difficulty. The *t*, *d*, *s* series were also very peculiar for the vowels *ee*, *oo*. I heard *t'haa*, *tsy'ee* (where *sy'* indicates simultaneous pronunciation of *s* and *y*) *t'hai*, *toa*; *daa*, *dzy'ee*, *dai*, *doa*; *saa*, *sy'ee*, *sai*, *soa*. But in place of *oo* in *too*, *doo*, *soo*, was uttered an exceedingly puzzling sound, which Hepburn writes *z* in *tsz*, *dz*, *sz*, but which may be imitated by *tsw*, *dzw*, *sw*, using the buzz of the *w* as a vowel. The sound was very short, and a labialised buzz was quite evident. The real sound remains in doubt. Lepsius (*ib.*) simply writes *oo*.

8. A young Hungarian, to whom I was explaining some English sounds, and who speaks English with great fluency, surprised me by finding difficulties with F and V. Csink (*Hungarian Grammar*, 1853, p. 2) assumes the English and Magyar F and V to be the same. I found that my pupil had no conception that he had to touch the teeth with his lower lip. When he endeavoured to imitate the sounds I gave him, he tried to make the hiss or buzz by using *f'*, *v'*, and putting his tongue against the teeth, producing remarkable compounds of *f'*, *th* and *v'*, *dh*. The direction to leave his tongue inactive and bring his lower lip against his upper teeth came to him as a revelation. I cross-examined him on the point, and he persisted that no Hungarian ever used his teeth for F and V. I requested him to ask some Hungarian friend of his in London. He did so, and reported that his friend also knew nothing of the action of the teeth. Yet Lepsius gives *f*, *v*, as the Magyar sounds (*ib.* p. 220). When my pupil complained of the great harshness of the English sounds, I could not help recollecting Quintilian's "dulcius spirat" said of Greek *φ*, and his "tristis et horrida, quassa quodammodo" applied to Latin F (*lib.* 12, ch. 10).

9. I have not had the advantage of examining any Englishman who habitually and unintentionally confused V and

W, but it would be very desirable for those who can catch such an individual (existing palpably enough in the mind of writers and of low comedians) to determine whether they do not say *v'*, which would probably sound as *v* when used for *w*, and as *w* when used for *v*. It is a pity old Mr. Weller, who spelled his name with a *wee* (*Pickwick Papers*, 1st ed. p. 366) cannot be put under examination. Last June, however, Mr. Bristed, of Lenox, Massachusetts, favoured me with the following information: "The inhabitants of Charleston and all the southern and south-eastern part of this state pronounce initial W, whether at the beginning of a word or a syllable, like V. Like V to me; perhaps you should call it *v'* or German W, which I own myself unable to distinguish from V. This peculiarity is common to all classes, except those of the upper class who have lived in Europe or at the north. They are not aware of it. I cannot find any European origin for it. It is supposed to come from the negroes. Teachers from the middle of the state have told me that the boys from the central and northern districts pronounce W in the usual and correct way." The French *bivouac* as compared with the German *Beiwache*, contains all the elements of this confusion, *vo* having been substituted for *v'*.<sup>\*</sup> The older French form *guet* from *Wacht* takes the other direction. Mr. Nicol, whose assistance I have elsewhere had to acknowledge (*E. E. P.* p. 724) is of opinion that the use of GU for the German W is evidence of a former pronunciation of German W as *w*, since *g* could apparently only have risen from the elevation of the back of the tongue, which is (at least generally) absent in *v'*. But if so, the use of *gu* in Italian establishes at least an ignorance of the sound of *w* in Italy, at a very early period. Perhaps I was wrong (*E. E. P.* p. 514, note) in thinking that "if the tongue is raised when sounding *v'* no ear would distinguish the result from *w*." At any rate I find that I can keep the back of my tongue firmly fixed in the *oo*-position, and yet distinguish *w*, *v'*, solely by keeping the lower lip tense for *v'* and pressed in on each side the medial line, so as to direct the breath upwards. I find also that when I blow out strongly, I hollow the cheek somewhat like a clarinet player, for *f'*, and round the cheek somewhat like a trumpet player for *wh*, the effect being of course greater in these voiceless forms. Mr. H. Sweet and Mr. Nicol, however, incline to think that a hollow cheek belongs to the *oo*-position. Hence if *w* was unknown in Italy when *gu'* was invented, we should be able to have German *v'* and Italo-Latin *v*, as Prof. Max Müller prefers.

10. Mr. Roby, who in his *Latin Grammar* prefers *w* for Latin V, after reading Prof. Max Müller's article in the *Academy* of 15th December, addressed to me a number of questions, some of which have been incidentally answered in the preceding paragraphs. Perhaps it may be of interest to the present enquiry to add brief replies to the remainder. The sound *wh* is only known to me as occurring in English and Icelandic. It is very probable that *w* may occur in Oriental languages (see above for Arabic, No. 6, and Japanese, No. 7), but it may be really a diphthongizing *oo* which has been taken for *w* (see above for Welsh, No. 5), and Lepsius probably does not accurately distinguish these sounds, which are almost universally confused, as he certainly did not distinguish *f'*, *v'* (see above for Japanese, No. 7, and Magyar,

No. 8). A confusion of *w* with *v* does not seem probable to me. The English *w* can be distinctly pronounced so as to close a syllable, with a preceding accented short vowel (see No. 5). The German *v* and also *f'* regularly and easily close syllables in the pronunciation of my Hungarian pupil, without a vowel following. The Germans of course have no such ending, as they regularly terminate words with voiceless consonants, whatever letters be written. I believe that the modern Greeks generally pronounce *ev*, *av*, before a voiced consonant or vowel as *ev'*, *av'*, and otherwise as *ef'*, *aaf'*, as in *avros*, but there is always a possibility of more or less dentality (as noted above, No. 2). The change of *oo* into dental *v*, as noted by Pānini, certainly shows his own pronunciation, but it was possibly as much a modernism in his time as our *f* in *laugh*, *draft*, *dwarf*, in our own. Prof. Max Müller (*supra*, vol. ii. p. 566, col. 2) has given two authorities for a pure labial sound in Sanskrit. If both *v*, *v'* co-exist in Germany, *v* as Lower and *v'* as Upper German, why may not both have at one time co-existed in India? But *v* seems certainly a more recent form than *v'* in Germany. Why then should it not be so both in India and Italy? As to the falling out of a dental *v*, the English *den*, *der*, *ill*, Scotch *deil*, *gin*, for *even*, *ever*, *evil*, *divel* (old form), *given*, seem to show the possibility. The English *w* falls out in *I'll*, *I'd*, *you'll*, *you'd*, older *for'ard*, *back'ard*, usual *fro'ard*, *to'ard*, and *Green'ich*, *Du'lich*, &c., but I cannot call to mind instances like the Latin. Actually in Magyar the verbal roots *szöv*, *löv*, *riv*, *növ*, *jöv*, lose their *v=v'* before the infinitive affix *ni*, and lengthen their vowel from *ö* to *ó*, but *hiv*, *sáv*, *vív* either lose or retain the *v*. The Latin *pra(v)orsus*, *ho(v)rsus*, *ama(vi)ss*, &c. may perhaps be compared with this Magyar custom. The Germans whom I heard while residing in Germany always seemed to use the succession *k + v'* and not the labialised guttural *kw'* for initial *qu*. I believe the Magyars when they spoke Latin said *ekv'os* for *equus*. I feel no tendency for *n* to become *m* before *v'* or *w*, or even *v*, because no English and German syllables occur which end with *-mv'*, *-mw*, *-mv*. But in Scotland *Banff* is called *Bahmf* (*ah* being rather spoken with the back of the tongue lower than for *aa*). In Latin the assimilation of prefixed prepositions, as *ad*, &c., shows that the final consonants must have been more closely connected than in English or German. This may account for *impero*, *immotus*, *commotus*, whereas English *unprotected*, *unmoved*, and German *unbrauchbar*, *Unmensch*, *unfehlbar*, *unwohl*, show no such tendency. The lengthening of the vowel in *in-sanus*, *in-faustus* (as noted by Cicero, but I cannot recover the reference at the moment), in *in* before *f*, *s*, perhaps indicates a difficulty in running the *n* on to *s* or *f*. As a substitute for *b*, I should consider *v'* more physiologically probable than either *w* or *v*, because the change of *b* to *v'* is a minimum, whereas for *v* the lower lip has to be violently retracted and brought hard against the lower teeth, and for *w* the back of the tongue has to be raised and the lips more rounded. If any one compares *pf'ooee* with *pfooee*, German *pfui*, he will feel the difference strongly. When we think we say *pwee*, for French *puis*, we really pronounce *puv'*, by preparing the tongue before releasing the lips. Actually *b*, *v'* interchange in dialectic German very frequently. I do not recall any instances of *b* and *w* interchanging. I consider *b* much more closely related to *v'* than to *w* or to *v*, and its relation to the two latter sounds is not direct, but indirect, through *v'*.

11. This is a mere collection of materials, to which it would be out of place to add an examination of the arguments for and against the pronunciation of Latin V as *w*. But in connection with the foregoing the following points should be considered. Latin V and Italian V are now *v* in Italy and in France, but either *b* or *v'*, not *v*, in Spain. I

<sup>\*</sup> Compare the Greek *ουβ* for Latin V in *Μηουβιάδος* for *Mevianus* (Corssen, i. 311). Compare also the curious remark of Salesbury (quoted in my *E. E. P.* p. 762—the spelling is here modernised): "Although the Germans use a *vv*, yet in some words sound they it (to my hearing) as the further *u* were a vowel, and the latter *o* [a?] consonant, where we the Britons sound both *uu* wholly together as one vowel, without any several distinction." Salesbury should mean *oo*, but may have meant *vo*.

cannot answer for the other Romance dialects. These sounds are not modern. The instances in Nos. 2 and 3 suggest that they were preceded by a mixed or geographically limited pronunciation as *v'* and *v*, of which the latter could have been derived from the former by emphasis (No. 2). In the time of Claudius a distinction between V followed by a vowel and followed by a consonant was felt, and a desire arose to mark it by a new sign. The former value was declared to be consonantal. Take *con-sonans* strictly, the name applies equally well to a consonant as now conceived (which implies an impediment in the way of strict vowel resonance) and to the stressless element of a diphthong connected with, or *sounding-with*, the element bearing the stress by means of the glide (see No. 5). When we find in especial that Sir Thomas Smith 1568, John Hart 1569, Bishop Wilkins 1668, all regarded English W as *ðo* (to the extent of writing *oo-oo* for *woo*), and that the same opinion extensively prevails at the present day, while the rejection of *n* from the indefinite article preceding W, as in *a week*, not *an week* (even in the Authorised Version, 1611, which generally retains *an* before *h*), shows that no such hiatus was felt in this case as in *an oozy bed*, we must allow that the same indistinctness of conception possibly prevailed in the minds of still older orthoepists, as Marius Victorinus, Priscian, Quintilian, &c. We have, therefore, no right to conclude that when they said V was a consonant they meant more than that V was the stressless element of a diphthong. The cases of V and of I are precisely similar. Now Priscian (as quoted in Corssen, i. 299) says: "*i* quidem modo pro simplici, modo pro duplici accipitur *consonante*," the first in *Juno*, *Juppiter*, the second in *maius*, *peius*, *eius*, "in quo loco antiqui solebant geminare eandem *i* litteram et *maius*, *peius*, *eius*, scribere, quod non aliter pronuntiari posset, quam si cum superiore syllaba prior *i*, cum sequente altera proferretur, ut *pei-ius*, *ei-ius*, *mai-ius*, nam quamvis sit *consonans*, in eadem syllaba geminata iungi non posset: ergo non aliter quam *tellus*, *mannus* proferri debuit, unde *Pompeii* quoque genitivum per tria *i* scribebant, quorum duo superiora loco *consonantium* accipiebant, ut si dicas *Pompelli*." Now we know that the first of these *i*'s was not a consonant in the modern sense, but only the stressless second element of a diphthong preceded by the glide. The inference is that the second was the stressless first element of a diphthong followed by the glide, and in point of fact we have precisely this effect, and not that of *yy*, in French *païen*, *faïence*, *nous louïons*, *vous suïez*, although French writers insist on the consonantal character of this *i*, as also on that of *i* in *collection*, *cieux*, *matriel*, *aimions*, *vous chanteriez*, &c. (Thériat, *Le Phonographe*, 1857, pp. 29, 30).<sup>\*</sup> In the case of *Pompeii* the threefold *i* had really the same meaning as the Italian *j* in *Pompej*, namely, the diphthong *ei* followed by *i* long. It is known that II and VV as the initials of syllables do not occur in older spelling. For the latter we have VO. Now on testing Welsh people with *would*, *woman*, *woo*, it will be found that they have a tendency either to say *oo* simply, or *ðo* + glide + *oa*, or *ðo* + glide + *o*. Many English say *wum-an*. It is therefore possible that I, V in Latin, so long as II, VV are not found as initials of syllables, were simply the vowels *ee*, *oo*, which

formed occasionally the stressless elements of diphthongs preceded or followed by the glide as the position required, and hence became *con-sonantes*, in the meaning attached to the word by the Latin grammarians. It is also possible that after II, VV were used as initials of syllables, a consonantal form (in the modern sense) was given to I, V, at least in those positions. This consonantal power may have gained ground. The modern Italian *Giugno*, &c. seem to indicate a precedent *yh*. The mixture of *ov*, *β*, in Greek transcriptions may indicate a mixed pronunciation, or a mixed conception of the sound by foreigners, leading to a confusion in spelling in the same writer, or a mixture of the alphabetic name *ov* with the phonetic equivalent *β* then = *v'* or *v*, but not *b* or *w*, although it had also to be used for *b*. The general use of *φ* to transcribe F, although we are certain that the sounds were different, at least as much as *v'* and *v*, shows that we must not press Greek transcriptions too hard. The Greek combination *οου* in *Οὐλουτοῦρνος* was simply impossible to a Greek, except as *oo* + *oo* or *ðo*. What was the possible consonantal sound (in the modern sense) which V received when the orthography VV initial became usual? Could it have been *w*? Could such a conception occur to the mind of any person to whom *w* was not a familiar combination, that is, among Europeans, to any but Englishmen? The passage from *oo* to *v'* consists in little more than dropping of the back of the tongue. The combination *v'oo* is very easy, as in German *Wuchs*, *Wund*, *Wunsch*, *Wurf*, *Wurm*, *Wurz*, *Wust*, *Wuth*. The combination *woo* is very difficult, even to Englishmen who are familiar with *w*, as in *woo*, *wood*, *woof*, *wool*, and is consequently rare, and often mispronounced. The inference seems to be that when initial II was called *yee*, initial VV was called *v'oo*. From *v'* the passage to *v* and the confusion with *b*, or with Greek *β*, was direct and easy. The final inference would seem to be that I, V should be considered as vowels, capable of becoming the stressless element of diphthongs, so long as II, VV initial are not found. That after these were found (and probably some time before they crept into writing, which always lags after speech) *y*, *v'* were employed when I, V were the *initial* (not the *final*) stressless elements of diphthongs. That in some words, and in particular in provincial pronunciation (as in Gaul and Spain, and partially in Italy, especially after Gothic irruption), *y* was pushed to *yh*, generating *dzh* in Gaul (subsequently *zh* or French *j*) and parts of Italy, and *gh* (or *kh* or the Spanish *j*) in Spain. That V either remained provincially as *v'* where B followed the same course (for example in Spain, as known to Romans even in classical times), or became dentalised into *v*, as being the firmer form and corresponding to the familiar *f*. But there seems to be no time during which English *w* can be interpolated. As a matter of practical convenience English speakers should abstain from *w* in Latin, because no continental nation can adopt a sound they cannot pronounce. As a question of date (which seems much overlooked, though synchronous pronunciation is the only one admissible), if the spelling VV is used, the pronunciation *v'* or *v* at pleasure may be employed, most of the Germans taking *v'*, and the rest of the world *v*. It may be noted that this overcomes the difficulty of contractions as *flu-vo-rum rex* (*vv* giving long *v*), *par-ie-te*, compared with *flu-vi-o-rum*,<sup>\*</sup> *par-i-e-te*; and *mil-vo*s with *mil-vos*, the diphthongizing *i*, *v*, making position, compare the French *Richelieu* (No. 5, at end); and also of resolutions as

\* The words of M. Jobert (*Colloquial French*, London, 1854, p. 42) form such an excellent commentary on Priscian's expressions that they deserve quotation: "The words *chancelier*, *chapelier*, *coutelier*, &c. do not appear *graphically* to contain a double consonant, but *phonetically* the *i*, in these words, fills the part of a consonant, in the same manner as the double *l* in the liquid syllables like those of *pillier*, *babiller*, *briller*, &c.; these *i*'s being pronounced as in *pi-îé*, *babi-îé*, *bri-îé*, the *i*'s of the former words are phonetically analogous in the last syllables, their articulation being *chancel-îé*, *coutel-îé*, *chapel-îé*."

\* Englishmen are so accustomed to pronounce *flu-vo* that they may think it impossible to pronounce *flu-vo* with a secondary accent, and without a subsequent consonant. But *ruha*, dress, in Magyar, is precisely in this condition, *ru* being short but accented, and not gliding on to *h*, and presents no difficulty at all to Hungarians.

*sol-v-is-se* for *sol-vis-se*, because the resolution would be an archaism preserved as Vergil's *picta-i* for *pictae*, or the frequent poetic English *-ed*. They are not to be explained from the habits of pronunciation prevalent at a later time.

ALEXANDER J. ELLIS.

P.S.—As will be seen by the foot-note to p. 16, the above article was sent to the *Academy* before I had seen Prof. Munro's remarks (*ib.*). I think it better not to occupy further space with any observations on the few matters there suggested which I had not considered in my own paper, except the personal reference to Prof. Max Müller's pronunciation, which I had purposely passed over. Prof. Munro says, Prof. Max Müller "will not have forgotten that a few weeks ago the untutored ears of half a dozen of the best philologists in Oxford were unable to perceive the slightest difference between his English *w* and their own." When last I had the pleasure of hearing Prof. Max Müller speak, he was able, by an effort of attention, to pronounce *w* and *v* correctly, but he habitually used *v* for both, and this was more apparent in public than in private speaking. If I mistake not, the point was made a matter of enquiry at a private meeting on another subject between Prof. Max Müller, Mr. A. Melville Bell (the author of *Visible Speech*), and myself, on August 25, 1865. May I suggest that the "untutored ears" at Oxford would derive every possible information on the subject from the "tutored ears" and lips of Mr. Henry Sweet?

A. J. E.

#### THE GERMAN UNIVERSITIES AFTER THE WAR.

IT is only since the beginning of the winter term that these seats of learning can be said to have returned to their normal state. A large number of young men were in the field for nearly a year, but even those in the army of occupation obtained leave some five or six months ago to return to pursue their studies. It is very interesting to observe the effect the war has had upon the attendance as well as the spirit of the universities. With some few exceptions, they are overcrowded this winter, because many old students who would without interruption have finished their courses by this time, have matriculated again along with the freshmen of this year. Quiet and busy work has entirely replaced the anxious bustle of the camp; helmet and uniform are doffed; even a medal and its ribbon have given place to the academical caps and badges. The names of those who died for their country, engraved on marble slabs, are already hung up in the halls of their respective universities. The most remarkable fact, however, appears to be that nearly every one of the survivors, unless he has preferred to join the army for good as officer or surgeon, has resumed his academical course where he left off with the greatest eagerness. The rush into "Fachstudium" has never been stronger in Germany than at present. The old patriots of the Wars of Liberation who attended the universities soon after the peace of 1815 may deplore the total absence of that idealistic spirit which brightened or obscured the days of their youth; yet there can hardly be a better sign of a healthy national development than this decided predilection of the young generation for matter of fact. The increase or diminution of the number of students in the different places may also be taken as symptoms of some further changes. The contest between the great and small universities seems to be taking a new turn, which could hardly have been predicted a few years ago. The more expensive places, like Berlin, Bonn, and Heidelberg, are slowly going down, not always, however, from the same reasons. Berlin, which might be expected to be the great high-school of the new empire, has yielded the palm at last to Leipzig. This is to be ascribed not merely to the supposed mismanagement of the most unpopular minister of public instruction Prussia has ever had, but to the drawbacks, especially the high prices and rents; perhaps, too, the long distances unavoidable in a capital. Cities of a middle size are evidently taking the lead again. Bonn, on the other hand, besides the more luxurious style of life prevalent there, suffers at present from the interdict issued by the Archbishop of Cologne against almost all

the professors of the Roman Catholic faculty because of their anti-infallibilist tendencies; and Heidelberg still lacks a garrison in which the students may pass their year of military service. Places like Halle, Göttingen, and Tübingen, where the influence of academical establishments is supreme, and which on the whole are well provided for, have received more than their usual complement. Even some of the smallest size, like Greifswald and Marburg, continue in a highly prosperous state, which is chiefly due to the recent popularity of their faculties of medicine; whereas another class, represented by Giessen, Kiel, and Rostock, seem doomed to die of exhaustion. With them, too, the causes of decline are multifarious. A small government like that of Hesse-Darmstadt has not the means of supporting any longer the establishment at Giessen on the scale demanded by the present development in every branch of learning and science; and the old wealthy institutions at Rostock and Kiel are shunned by the Mecklenburghers and Holsteiners themselves, since they have the free choice of any university they like, whereas young men from the other parts of Germany hardly ever come to the shores of the Baltic, where life is both more expensive and slower than anywhere else. Yet Greifswald and Königsberg are to a certain extent exceptions to this rule. Jena, about fifty-five years ago the most fermenting seat of the "Burschenschaft," though not threatened exactly by a lingering death, has at last, as it were, succumbed to a musing condition of still-life. It may be hoped that the approaching reconstitution of Strasburg may prove to be the same successful experiment as Bonn, where, immediately after its foundation, the professors of name\* and celebrity as well as students from all parts of Germany began to flock.

R. PAULI.

#### Intelligence.

Prof. W. D. Whitney, of New Haven, intends to publish in the next volume of the *Journal of the American Oriental Society* the results of a collation of a new MS. of the Atharva-Veda Prâtiçākhyā. His own edition of this Prâtiçākhyā, published in the *Journal* for 1862, was founded on the inaccurate and imperfect, but at that time unique, Berlin MS.

M. J. Derenbourg has been elected a member of the Institut (Académie des Inscriptions).

The *Transactions of the Royal Society of Saxony* for 1870 contain (pp. 227-295) the third part of Prof. Fleischer's Contributions to Arabic Grammar, viz. corrections, additions, and explanations to de Sacy's *Grammaire*.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 41.

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.

The next number will be published on Thursday, February 15, and advertisements should be sent in by February 10.

The Second Volume (October 1870 to December 1871) is now ready, bound in cloth, price 15s. Covers may be had of the Publishers, price 2s.

## General Literature.

Modern and Ancient Greece. [*Das Volksleben der Neugriechen und das hellenische Alterthum.* Von Bernhard Schmidt. Erster Theil.] Leipzig: Teubner, 1871.

EVER since Leo Allatius published his tract, *De quorundam Græcorum opinionibus*, in the middle of the seventeenth century, the attention of travellers has been drawn from time to time to the correspondence between the customs and superstitions of the inhabitants of the Greek peninsula in ancient and modern times. During the last fifty years the work of observing and collecting these had proceeded apace, and much valuable information is to be gathered from the works of such critics as Fauriel, Pashley, Ross, and Ulrichs, together with the numerous scattered notices to be found in the writings of the modern Greeks themselves. Latterly, a useful summary of these points has been made in C. Wachsmuth's pamphlet, *Das alte Griechenland im neuen*, which, for its size, contains a wonderful supply of valuable facts and suggestions on the subject. Still, much remained to be done in the way of bringing together additional material, and arranging it perspicuously with a view to comparison with antiquity; and consequently the present work has long been looked forward to as likely to supply this desideratum. It was also soon perceived that the discussion of this question was intimately connected with that of the origin of the modern Greeks, and that any well established resemblances in habits and beliefs would form a strong argument against the theory of Fallmerayer, that that people is of purely Slavonic race. Accordingly among Greeks it was expected that M. Schmidt's work would have a distinctly polemical object, and would professedly combat those whom they regarded as the foes of their nationality. The author, however, disclaims any purpose that is not purely antiquarian; but at the same time he has furnished one of the most convincing replies that has yet been given to the opposite view, not only from the general tenor of his work, but also from the arguments adduced in the preface, and especially in the collection he has made of the rarer words from ancient Greek, which are still to be found in isolated modern dialects—a source of proof on which he, with good reason, lays great stress, because, as they are unknown to the speech of the more educated classes, they show unmistakably that they must be indigenous, and not introduced from abroad.

Of the way in which M. Schmidt has executed his work we can speak in the highest terms of praise. Quite independently of its immediate object, the book is admirable as a collection of the superstitions of a country, and as such it will be of service to those who are gathering materials for

VOL. III.—NO. 41.

the early history of mankind. But it is in comparing the ancient and modern superstitions that the writer's skill is especially shown. What is most required for this purpose is a complete mastery over the details of the subject, as it is often in minor traits that the most convincing resemblances are to be found; clearness of arrangement, to facilitate comparison; and impartiality of judgment, to convince the reader that he is not being led astray by points of accidental similarity, and yet not to ignore what a careful examination will show not to be the result of chance. All this will be found in the present work, together with a thorough knowledge of classical antiquity: to which we may add that M. Schmidt has himself resided in the country for three years, principally in the islands of Zante and Cephalonia, and has there made a collection of popular songs and stories, which will form an excellent supplement to the *Griechische und albanesische Märchen* von von Hahn. It is a satisfaction to hear that this is nearly ready for publication, for it is often quoted in this book, and it is somewhat tantalizing to be referred to an authority which has not yet seen the light. We are not certain whether the writer has in all cases sufficiently estimated the amount there is in common between customs and ideas which he finds in Greece and other systems of superstition: perhaps the perusal of such a book as Mr. Tylor's *Primitive Culture*—a work *sui generis* for its grasp of the general subject and power of grouping—might lead him to modify some of his conclusions; but this is almost unavoidable in a subject of this character, and as a general rule he has shown remarkable self-restraint in avoiding doubtful points. Finally, we should not omit to notice the exhaustive way in which information has been gathered from a great variety of modern Greek publications, many of which can never be accessible to students in Western Europe.

The work is to consist of three parts, the first two of which relate to the superstitions, the third to the customs of the country: the first part has now appeared. Most of the figures that appear in this were already well known—the Nereids, who represent the ancient nymphs; Gillo, Momo, and the Lamia, familiar bugbears of antiquity; the Telonia or spirits of the air; *στοιχία* or genii; the Fates, and Charon, the god of death, with many others. But the information that has been collected respecting them is given here much more fully than in any previous book, and not a few of the additional points are important from the resemblances they offer to ancient beliefs. Thus it is difficult to regard it as the result of chance that, while the classical Empusa was believed to have one foot of brass, the other like that of an ass, the modern Lamia has a brazen and an ass's foot. The story of the vulnerable heel of Achilles is reproduced in connection with certain giants, who are said to have been rendered safe from wounds by being dipped in a river by their mother, except in the ankle, by which they were held. The Cyclopes reappear in a race of wild, lawless, one-eyed monsters, who are known as the *μονόμματοι*. We also meet with a being possessing the attributes and functions of Pan, and even the name of Panos or Panios was reported to the author as existing in Zante for the patron spirit of goats who dwells in the mountain gorges, though he judiciously hesitates to accept this as a fact without more certain evidence. Similarly, in offerings which on certain occasions are made to the Nereids, it is customary for the giver, after presenting them, to hasten away without looking back, as we know from Sophocles and Virgil was the case in ancient times. And as these spirits are regarded as exercising their malignant influence especially at midday, in the neighbourhood of springs, and under the shade of certain trees of which the plane was one, these circumstances are adduced as illustrating the passage in Plato's *Phædrus*, where Socrates

speaks of the possibility of his becoming *νυμφόληπτος*, and the reader is reminded that all these conditions were present on that occasion.

Besides these details which are either new or have not been much noticed hitherto, there are also a number of mythological personages whom M. Schmidt has brought to light for the first time. Such are the Drymae, who are only known in parts of Greece, and correspond to the ancient Dryads, though they have also a partial resemblance to the nymph Echo, as they are believed to be spiteful towards those who make reverberations in the mountains. Such is also the Sea-spirit, a compound of Nereus and Poseidon, who is represented as riding on dolphins with a trident in his hand, and having a fish's tail; and the Lamé-spirit, the most dangerous and injurious of all the fiends. Here also we first learn of the existence of a Charontissa, or wife of Charon, a modern Proserpine, who rules by her husband's side in Hades, and performs the milder office of comforting the departed spirits when they first arrive in the realms below. It is also a point of some importance that while hitherto the Charon of the modern Greeks has only been known as the hunter of men's lives and the jailor of the dead, he is now discovered to be regarded in some places as the ferryman of the infernal river, and his boat is spoken of, and the passage-money which he demands. This last point had already been rendered probable by the term *περατικός*, applied to the custom of placing a piece of money in the mouth of the corpse, which until lately was commonly practised, and even now is found in some parts of the country.

Perhaps the most interesting section of the work that has appeared is the part which relates to God and the saints, and the way in which the attributes of heathen divinities have been transferred to them. In his collection of Popular Tales, the author promises to present us with a story in which the combat of Zeus with the giants is attributed to the Christian God. Not a little remarkable is it that the modern Cretans make use of the invocation *Ζώνε θεέ*, and on the sides of Parnassus the exclamation "God of Crete" is used to express incredulity, which seems exactly to correspond to a statement of Origen, who said that the early Christians were accused of ridiculing the worshippers of Zeus, because the burial-place of the god was shown in Crete. In connection with Mt. Olympus, round which many modern superstitions centre, M. Schmidt might have noticed the remarkable fact that all the monasteries on that mountain are dedicated to the Holy Trinity, and this circumstance is very probably connected with its having been the special abode of the highest of the heathen deities. With regard to the summit of the mountain, which is described in the popular songs as "the triple peak of heaven," and is regarded as the dwelling-place of the Fates, he might have mentioned that a reference seems here to be made to the three highest points, which are known to the inhabitants of Olympus as "the Three Brethren" (*τὰ τρία ἀδέρφια*). The author remarks (p. 69) that he cannot find any certain evidence of votive offerings having been made in ancient times after some special deliverance, containing an emblematic reference to the origin of the vow: we would suggest that the figure of Arion on the dolphin at Taenarum was probably of such a character. Again, we do not think M. Schmidt, in tracing the connection between the ancient and modern religion, has sufficiently taken into account the great number of ancient shrines and holy places which are now entirely deserted, and have not been replaced by any Christian place of worship, offering thereby a marked contrast to what took place in Italy, and testifying to the same struggle in which the name *Ἑλλην* became identified with "pagan," and was replaced by that of *Ῥωμαῖος*. No doubt the Parthenon may

have been purposely converted into a sanctuary of the Virgin Mother of Christ, and that of Theseus into a church of the Christian warrior St. George; and it may not be accident that a religious festival accompanied by dancing is celebrated on the top of Mt. Ithome at the present day, just as it was in ancient times in honour of Zeus; but these are rare exceptions, and in the great majority of instances there is reason to believe that the ancient temples were placed under a ban. We believe also that M. Schmidt is right in not connecting the *cultus* of the Prophet Elias as the patron of high places with the worship of Helios, because of the comparatively few mountains on which there were shrines of that god; and he very properly derives this function which the Greek Church has assigned to the Prophet, not, as has often been thought, from the sacrifice on Carmel, but from his ascent into heaven: this, we may remark, is confirmed by the Russian legends which identify him with the god of thunder. We might add many more subjects of interest which are illustrated by the work before us, but we hope we have said enough to persuade our readers to peruse it for themselves, and to those who do so we can promise an ample store of curious and valuable information.

H. F. TOZER.

The Gospel of a Poor Soul. [*Das Evangelium einer armen Seele.* Mit einem Vorwort von Hermann Lotze.] Leipzig: S. Hitzel, 1871.

WITHOUT being really important, this little book is extremely suggestive and extremely interesting, for it is hardly too much to say that in it what many consider the dominant religious movement of the day crystallises for the first time into something clear and tangible. There are many besides Dr. Arnold who wish to retain religion to light up morality, and hold that all beyond this is mischievous and misleading, and for these "the Poor Soul" who parades her self-pity with overmuch complacency has wrought out a coherent theology with a definite basis in the actual experience of the spiritual life. Much skill is shown in working out the system so as to account for as much as possible, and at the same time to avoid all possibility of collision with positive knowledge and the facts of the world. In this way it would be possible for any one who had once lost sight of the arbitrary character of the starting point to be consoled and elevated and strengthened by the theory throughout life, and very little disturbed by finding that he uniformly failed to convince others of its truth.

The Soul begins with the observation that people often pray and do not receive what they pray for, and that this sometimes happens even when it seems that they would be better for receiving it, and this observation awakens her first doubts which she endeavours to combat with the usual pious sedatives. Then she (according to F. W. Newman, the soul is never perfect till she is a woman, though this particular soul seems to have been originally meant for a man) experiences for the first time the insurrection of the animal nature. In the combat she discovers the necessity of holding fast to God, without Whom her resolution would, it seems, have given way, though without inflexible resolution it is useless to call upon God. This experience is the foundation of all that is to follow; it is the writer's only criterion for fixing the conception of God and for establishing its validity. The ecstasy which followed this first victory is put aside as purely subjective, and the soul proceeds to meditate on the three possible ends of human life, sensual pleasure, intellectual enjoyment, and active love, and chooses the last, which seems to be synonymous with spontaneous beneficence. The choice is quite independent of any consideration of the complex capacities of the human mind, or

of the conditions which control the course of human life. Its grounds are so ideal as to be hard to seize; although they are repeated many times in the course of a short book, it is hard to be sure that the following statement is fair. If we imagine the Soul in the full enjoyment of sensual or intellectual pleasure, she might still ask, Was it worth while to have been born for this? and the question would be unanswerable; but active love can always answer that it is worth while to have been born for others. If this be correct, it is obvious that the decision is taken in a mood which cannot be habitual. However, the Soul perceives that it was her resolve not to lose sight of this, the true end of life, that led her to cling to God, and as she has gained strength from Him for this, she concludes that He is, in His Essence, conscious, holy, hallowing Love, in the strength of Which we love. This, of course, is an effectual barrier against every pantheistic tendency, and according to the writer it has further consequences. There is much ingenuity in the discussion whether God can be the Creator of the world in general, or at any rate of the spirits who return His love, and nearly every creationist theory is examined in passing before both alternatives are dismissed. Though the argument proceeds rather in the dialectical than in the logical order, this does not really matter, for the object is simply to lay the ghosts of old prejudices; the truth is sufficiently established by the simple reflections that if God be the Creator either of the world or of the spirits conditioned by the world, He must be something other than pure Love, and that unless this conception can be maintained as exclusive, it would obviously require to be limited and qualified; but in experience the conception has been given without limitation. Here again the conclusiveness of the reasoning is open to discussion.

After this point the current of the Soul's thought is varied from time to time by colloquies with God. We will not say with a much more thorough-going mystic, St. John of the Cross, "all this that she says, Then I spake to God, then He spake to me, is pure nonsense;" at best it is a game of chess, played blindfold, the right hand against the left, for kisses, in the glass. Her God generally keeps up to the highest average manner of the colloquies in books of devotion; but we are reminded by His lengthy expositions, of the heathen who think to be heard for their much speaking; partly, no doubt, because books of devotion are read for edification, while the *Gospel of the Poor Soul* will be chiefly read for curiosity; partly, too, because books of devotion are occupied with the inculcation of a complicated series of thoughts, not of a single striking conception.

The belief in God as the Creator is referred to the fact that the false ends of life are more often pursued than the true, and therefore any popular piety will represent God as controlling the conditions of their attainment; the writer is specially anxious to maintain that the dogma of creation is neither a necessary nor an adequate guarantee of reverence.

As the Soul is capable of love, freedom is a condition, though a transient one, of her blessedness; as God is love, the absence of freedom is involved in the idea of His. His blessedness depends solely upon His readiness to help when opportunity offers: before the world had brought souls to consciousness, it was complete—it is not impaired by sin. Such, too, is the blessedness of the souls which sincerely choose love as the law of life, however late: they exist from eternity like everything else in the world in their germs and elements (a curious phrase, which must have a meaning, as it is repeated so often), but they only attain to consciousness through bodily life; having once attained to consciousness, God can maintain them in knowledge and love

of Him if they have lived to Him (it is not stated that He can make them partakers of His power to help the living, or to translate the author's view into Christian language, the saints see God, they do not reign with Him): those who have not lived to Him are dead to Him for ever. This is His judgment and their only hell: they sink back into the unconscious "rudiments of the world." Only those capable of choosing deliberately between the three ends can reach everlasting life: this excludes children, idiots, and lunatics; but not savages, who are credited with a knowledge of the evil of selfishness, because they object to suffer from it. All positive religions are indifferent except so far as they help or hinder the recognition that God or the gods must be love, for with the disappearance of the dogma of Creation all the ordinary objections, religious and intellectual, to polytheism disappear. The speculative superiority of monotheism is rested on the uniformity of the divine action on the soul, which would be a better ground for inferring the essential similarity of all spirits who have once been made perfect in love. The writer's criticism of Christianity is, as might be expected, crude and perfunctory: as the method of his theology excludes a philosophy of nature or history, its value for him in no degree depends on the truth or falsehood of its supernatural claims, which are rejected on the ground that Christ foretold His second coming as immediate, that His miracles were intended as proofs of a commission from the Creator, and that the beneficent achievements of science do far more than isolated wonders to transform the material world into the Kingdom of God.

We have described this curious system at length because it is impossible to read the book without forming a high opinion of the moral and intellectual power that went to writing it; the influence of such books is in reality an affair rather of fortune than of merit: if a visitor from another planet, who had read the Bible, were to read the *Gospel of a Poor Soul*, the *Patience of Hope*, *The Soul*, and *Ecce Homo*, he would not share the decisive preference of the British public for the last—all would interest or fatigue him alike.

Of course the division of the three ends of life is arbitrary and inadequate: the majority of mankind (as the writer of the beautiful chapter on the natural man in youth, manhood, and old age should have known) go through life without being guided by any end at all; they are like donkeys moving round and round to turn a capstan; they are beaten if they stop, but if they keep moving, they may browse on the right hand or the left, it matters to nobody, not even in this world, to them. The few to whom an ideal end is a necessity, or a comfort, or a luxury, commonly conceive it in many ways; their own desires have wavered; they know that other men desire other things: if theists, they look to God to satisfy, in some transcendental way, all desires which they do not disapprove. It is a serious defect of the system that though the conscious soul is represented as a product of the world, it seems to have no duties to it and no interest in it. Those who, like the author, are reasonably disposed to elevate the postulates of the moral and spiritual life to the rank of speculative intellectual axioms will hardly be disposed to accept this God, Who can only help those whose will is fixed, to make shipwreck of earthly life rather than forsake Him instead of the traditional Father, Who is always more ready to hear than we to pray, Who is wont to give more than we desire or deserve, Who will not break the bruised reed or quench the smoking flax. Those who are satisfied to live according to their ordinary selves will readily make the not recondite observation that the influence of an ideal upon those who cling to it is no guarantee of its independent objective existence for others.

G. A. SIMCOX.

## LITERARY NOTES.

In Westermann's *Monatshefte* for January, Freiherr von Maltzan corrects the common, erroneous impression that *café noir* is the orthodox Arabian beverage and *café au lait* a Western corruption. On the contrary, the Bedouins of South Arabia, the oldest coffee country in the world (except Abyssinia), have assured him that the full flavour and aroma of the coffee is only to be brought out by the addition of milk; and their connoisseurship is beyond dispute. Von Maltzan thinks the usage depends upon climate; the natives of the hottest lowlands do not drink what we call coffee at all, but an infusion of the pod or bush containing the beans, which is called *gischer*, and is less stimulating than coffee, while it has the same aroma. Its qualities are lost in transport, or it would be a valuable substitute for chicory and other adulterating ingredients.

The Punch of Munich, edited by Dr. Martin Schleich, has ceased to exist. It was once one of the most popular and widely circulated of comic illustrated journals. In its place appears every Saturday *Die Bremse*, edited by Dr. Sigl, editor of the *Vaterland*.

In *Im Neuen Reich* (January 5) Gustav Freytag addresses some advice "to young novelists," which, as he says, is not new, but might be serviceable to his countrymen (and women) if they would give it their attention. He complains that most writers invent their characters first, and that with little regard to nature and reality, and then frame a plot to bring out the idiosyncrasies of the being they have imagined. He adds that the art of inventing and telling a coherent story has at no time appeared to thrive in Germany, but hopes it is never too late to mend.—In the same paper (January 12) Mich. Bernays represents Uhland in the new character of a student of ancient German literature and legend, and explains by his devotion to these researches the poetical unproductiveness of the latter half of his long and peaceful life. Uhland was fastidious, and refused to publish fragmentary notices while he failed to complete an elaborate work to his own satisfaction. Seven volumes, to be followed by an eighth, testify to his industry; and though most of his facts have been anticipated now, they have not been presented in a more attractive form, nor in one which preserves better the proportions of the subject as a whole.

The *Rédaction* of the *Revue des deux Mondes* is going shortly to publish an index, which can scarcely fail to be an interesting contribution to literary history, as it will apparently include notices of the authorship and circumstances under which the more remarkable articles appeared during the forty-two years that the *Revue* has been identified with the best literary workmanship in France.

## Art and Archæology.

Pictures by Daniel Maclise, R.A., with Descriptions and Biographical Sketch of the Painter by James Dafforne. Virtue and Co.

Pictures by C. R. Leslie, R.A., &c.

THESE two books are produced in the same manner, and are, indeed, intended to be companion volumes, so that we can with propriety notice them together. A series of engravings from the works of a deceased master in his art published in this style appears to be exactly the right way to celebrate our leading artists as they pass from the stage. An exhibition of their collected works, as after Etty's death at the Society of Arts, or two years ago those of Leslie at the Royal Academy, is very interesting to those who have the chance of visiting such exhibitions, and to the critic is inestimable, preparing for him the opportunity of deciding for ever after the relative position of the painter whose works are so collected. But for the public, the few months that such collection remains together soon pass without any record, while such volumes as these remain in some sense a monument to the artist. Viewed in this way, we should have the best examples given—the works that made the

master's reputation; otherwise the monument will not be just to his fame. In the Leslie volume we think this is the case, as we have "Sancho and the Duchess," "Autolycus," "Perdita," and two of his best subjects from Molière; but Maclise is not so lucky, and he it was we hoped to find most worthily represented. The memoirs of both artists are exceedingly well related; but here, again, the man who celebrated the arms of Britain in the two greatest historical pictures of our epoch, perhaps the two greatest contemporary historical pictures in the history of art, does not find so large an acknowledgment at the hand of Mr. Dafforne as he deserved. The seventy or eighty portraits of the literary men of the day published in *Fraser's Magazine*\* are not mentioned, as they are not in Mr. O'Driscoll's volume, necessarily Mr. Dafforne's authority; and the two great pictures in the Houses of Parliament are but scantily treated. All the engravings given are of his smaller exhibition pictures, including, however, the play scene in *Hamlet*, now in our National Gallery. Wherever the female element predominated, Maclise failed. The meretricious beauty, which at this short distance of time we already see was common property to Etty, Leslie, Maclise, and their followers, and which, we think, was derived from the deadly artifice of Chalon, is more destructive to him than to the others. Where men only appear, or women but very little, as in the "Bohemian Gipsies," or the "Marriage of Strongbow," his romance is heroic and splendid; and where he worked under a living motive, as in the "Wellington and Blücher" at Westminster, he must be acknowledged without a rival.

W. B. SCOTT.

## ART NOTES.

Mr. Crowe, the joint author with Signor Cavalcaselle of the *History of Italian Painting*, writes to us to complain that a writer in the current number of the *Edinburgh Review*—

"has attempted to create a distinction between the two persons whose names appear on the title-page of that work, against which they feel entitled to protest. The critic speaks of one of the authors as having had the mere labour of giving form and order to the materials of the other. He speaks of the latter as the author, and gives him qualifications denied to his partner. These statements convey an impression altogether contrary to the reality, and the *History of Italian Painting* is, as it purports to be, in every sense the work of two partners, both of whom are men of education and special knowledge of art, good draughtsmen, and travelled artists."

We may add that the article, though highly favourable to the book, contains a number of other inaccuracies, in the smaller matters of date, spelling, &c., which render the claim of the writer to differ on points of this nature with two such accomplished experts as Messrs. Crowe and Cavalcaselle singularly out of place.

On Wednesday evening, January 24, an exhibition, now open to the public, was inaugurated at South Kensington Museum, by a "private view," at which a good many hundred well-dressed people assisted. This exhibition consists of the mass of productions of ornamental art, gifts for the most part, collected by the Duke of Edinburgh in his voyage round the world in the *Galatea*, spoils of the chase and of the rifle at sea and on shore, and the more personal records of the prince's progress, in the shape of illuminated addresses, not only written on vellum and paper, but engraved on hinged silver like triptychs, fancy trowels, and so on. Besides all these, the two series of water-colour drawings by Messrs. Brierly and Chevalier, able draughtsmen who accompanied the prince, form an exceedingly interesting collection of illustrations of the natural scenery visited and adventures taking place during the varied expedition. Arms and dresses there are a good many, but the most deserving of record are the bronzes, enamels (*cloisonné*, said to be) from China and Japan. A large ornamental bronze incense-burner in three stages, from the latter country, presented by the Mikado,

\* See *Academy*, vol. ii. p. 217.

is perhaps the most perfect work of the kind yet brought over. The gold embroidered textiles, carpets, kincobs, &c. given by the Maharajah of Jummoo, the City of Benares, &c. are also remarkable.

The First Commissioner of Works has received from the Berlin government an invitation to British architects to compete for the new Houses of Parliament in that city. Architects of other nations are also invited. The designs must be sent in at latest by the 15th of April. Completely worked-out building plans are, of course, not expected. It was mentioned in the *Beiblatt* to the *Zeitschrift für bildende Kunst* for December 1, 1871, that when the Reichstag accepted the report of the first commission appointed to consider this subject, the condition was added that the competition should be limited to Germans.

A necropolis of the Gallo-Roman epoch has been discovered at Bingen. Vases, urns, lamps, &c. abound.

All the collections of Prince Napoleon will be brought to the hammer at Christie's during the spring.

The *Chronique des Arts* for December 24, 1871, announces that new tombs have been brought to light at Athens, amongst others a funeral monument ornamented by a fine bas-relief representing two female figures larger than life, one seated, the other standing. Excavations have also been undertaken in the environs of the so-called portico of the Eponymii. The result appears to throw discredit on the theory in accordance with which the portico was named. The colossal statues found, of which three are yet preserved, make up but four in all. They supported, after the fashion of caryatidæ, the entablature of an edifice of which both the name and purpose for the present must remain in doubt.

Mr. Watts, R.A., will send to the exhibition of the Royal Academy three portraits: two of brother artists, viz. Mr. Calderon and Mr. Val. Prinsep, and one of Miss Dalrymple. At present he is engaged chiefly on a large work which he intends to offer as his diploma picture, and which will also appear in May on the walls of Burlington House. It is decorative in character, the subject is the murder of Abel. The figure of Cain fills the centre, at his feet lies the prostrate body of Abel. The spirits who, rising to heaven, were embodying the aspirations of the sacrifice, changed by the act of Cain into avenging demons, sweep back from on high. The picture is yet in the first stages of progress, but there are signs of that desire to pass beyond the trivial and commonplace, and to get at a poetic and dignified side, which is invariably characteristic of Mr. Watts, even when his work is in other respects incomplete. In the present instance the crowning point of the composition is the figure of Cain, the strong man, whose power is appalled, by the weight of retribution. The subject, too, has been happily chosen, as, although to a certain extent susceptible of allegorical interpretation, it does not pass beyond the limits of that which is easily intelligible.

The bas-relief representing Henry IV. on horseback, which was torn down from the Hôtel de Ville of Paris by the Communists, has been found. This important work had been broken up, but all the fragments have been collected, and it will be possible to restore it perfectly.

A bust of the late Mr. Grote, by the sculptor Charles Bacon, has been placed in Westminster Abbey.

The Musée of Brussels has just acquired a fine portrait of an old man by the vigorous hand of Bernardo Strozzi, the chief of the Genoese school, commonly called Il Capucino. At the same time a superb example of Benjamin Cuyyp, a portrait of a young woman, has been presented to the Musée of Lille by M. Louis Decamps, who has also enriched the collection by the gift of the only known picture by J.-B. Wackis, a Dutch painter of the seventeenth century, now so forgotten that his name is not even cited by those writers who have specially occupied themselves with the art of the Netherlands. The picture in question, the subject of which is a vase of flowers, is said to have very high

merit. M. Decamps has quite recently presented to the same Musée six fine drawings by Calamatta, Flers, Troyon, Decamps, Raffet, and Charles Jacque.

A statue of Sir Bartle Frere will be sent by Mr. Woolner, A.R.A., to the forthcoming exhibition of the Royal Academy. The head is admirable, both in point of likeness and execution, the modern costume handled with skill and much success. Yet the general impression is scarcely satisfactory, the figure fails to seem informed by a clear grasp of the man as a whole. In short, Mr. Woolner still falls somewhat short of the very high standard he is always expected to reach. "Guinevere," commissioned by Mr. Kirkman-Hodgson as a companion statue to the "Elaine," previously exhibited, will also be seen at the Academy. Mr. Woolner's reading of the character is voluptuous rather than passionate, the queen is what Diderot called a *belle indolante*.

The magnificent collection of modern pictures brought together by M. Paturle, and which have been since his death the property of his widow, will be sold towards the end of February at the Hôtel Drouot. At the same time and place the collection of M. Michel Tretaigne will be brought to the hammer. The well-known gallery of M. Péreire is also about to be sold by auction. The works of Ary Scheffer, Delacroix, Ingres, Meissonier, are here mingled with capital examples of Ostade, Terburg, Ruysdaël, Hobbema, Franz Hals, and Rembrandt. The prospect of the immediate dispersion of this collection is exciting the art world of Paris.

The Administration des Beaux-Arts has recently purchased for the Luxembourg two paintings by Henri Regnault, both of which were exhibited last year in London, viz. "Le Décapité," and the equestrian portrait of General Prim.

The January number of the *Gazette des Beaux-Arts* contains a sketch of the life of Regnault, by Paul Mantz, accompanied by an excellent etching of his powerful and repulsive "Salome" exhibited at the Salon of 1870. The article entitled "Les Musées, les Arts et les Artistes pendant la Commune" is valuable as a piece of contemporary history. The documents are given in full. In a paper headed "Les Faïences de Philippe le Hardi," M. J. Houdoy announces the discovery of certain fragments of *carreaux émaillés* on the site of the south tower of the castle of Hesdin. This is important as corroborating a theory put forward by him in his *Histoire de la Céramique lilloise*, to the effect that faience was fabricated in Flanders and Artois as early as the close of the fourteenth century. Additional confirmation will also be found in the items of an inventory dated 1452, which he gives at full length.

In the *Times* of January 18, Mr. Robinson replies to the second letter of "C." (*Times*, January 12) on the subject of the "Uncatalogued Masterpiece." Firstly, the predominance of fair types in the personages does not argue a non-Peninsular origin; for the majority of the figures are actual portraits of the reigning king and his family, one of whom, a daughter, who became the wife of the Emperor Charles V., is painted by Titian in "La Gloria" as a woman of a delicate pale complexion, slight hectic blush, and with abundant golden hair. Secondly, "C." having described the weeds of the foreground as plants rare in the Peninsula, specifies one, "the wild columbine," which is common there. Thirdly, supposing that a monogram exists, it would be more likely to occur on work of Spanish or Portuguese origin than on a Flemish picture, as early Flemish artists were not in the habit of signing their paintings. Fourthly, even if the landscape background showed a northern country (which Mr. Robinson doubts), it should be remembered that early painters often showed a strong predilection for representing in their backgrounds the scenery of lands foreign to them. Fifthly, the red cow, which is noted by "C." as of a colour unusual in the Peninsula, finds a companion in a red bull which occurs in a fine illumination preceding the Office for the Dead, in a manuscript "Book of Hours," which belonged to Alfonso V., King of Arragon. The book, which is in the possession

of Mr. Robinson, was executed about 1442. In respect of the wheeled plough, who shall say that in Dom Emmanuel's time such a thing was unknown in Portugal?

The *Bullettino dell' Instituto*, &c. (December) contains an account by Lanciani of the recent excavations round the three columns of the Temple of Castor. The most curious thing is the discovery of the deep springs which once fed the Lacus Curtius, and which are noticed in several of the old MS. descriptions of earlier excavations to which Lanciani refers. There is some hope that further remains of the Fasti Capitolini may be found, which on one theory were attached to the walls of this temple—a temple in which the senate not unfrequently met. The depression of the *cella* below the level of the outer part of the temple is also commented on.

The *Revue archéologique* (December) contains an article by Maspero on the stele of excommunications found at Napata, the capital of Ethiopia; and an account of the Temple of Augustus at Ancyra in Phrygia, by the architect of the French exploring expedition to Galatia (the 24th and last part of their great work is just being published).—An ancient caricature of Ganymede on a Roman lamp now in the Louvre is described.—Ruelle announces that he has been able to take a complete list of the Greek MSS. in the chapter library at Toledo.

The *British and Foreign Evangelical Review* (Quarterly—Edinburgh), January 1872 ("On Ephesus and the Temple of Diana," by Alexander S. Murray), reviews Guhl's *Ephesiaca* and Falkener's *Ephesus*, and gives an accurate and most readable history of Ephesus and its site from the earliest times to the present hour, concluding with an account of Mr. Wood's excavations now in progress on the site of the famous temple.

A portrait of Sir Philip Francis, by Lonsdale, has been lately added by the Trustees to the National Portrait Gallery in Exhibition Road, South Kensington. It is, apparently, the original of the well-known engraved portrait which fronts the title-page in Mr. Taylor's *Junius Identified*.

Dr. Curtius sends to the first number of the *Preussische Jahrbücher* (January 11) a short account of his visit to Asia Minor and Greece, together with some fresh inscriptions discovered by himself and his companions. He undertakes to make public, with as little delay as possible, the topographical and other results of his expedition.

As a musical event of considerable importance last Saturday we have to record the performance of Liszt's Concerto in E ♭ at the Crystal Palace by Mr. Dannreuther. The enthusiastic reception of the work by the audience, equally due to its intrinsic value and to the excellent performance, showed once more the sympathetic feeling of the English public for the productions of the modern German school. This favourable result is even more conclusive than the success the same concerto met with at Mr. Bache's concert last season, where the Liszt worshippers had assembled in full force, while this time the work had to appeal to the miscellaneous elements of the public in general. Mr. Dannreuther's rendering was highly praiseworthy in most respects. He had grasped the poetic meaning of Liszt's music with rare felicity, and mastered the immense technical difficulties of the work to a considerable extent. We remember having heard the same work rendered by Tausig, the lately deceased king of his instrument. He was certainly superior to the London performer in the infallible correctness and appalling brilliancy of his play, but by no means as far as touch and expression are concerned. The double turn in the slargando movement was given by Mr. Dannreuther with the most delicate and graceful *dolcissimo*; and equal praise was due to the rendering of the theme of the adagio with its arpeggio-like accompaniment. The orchestral part was upon the whole, and considering the difficulties of the work, satisfactory. Here and there it seemed wanting in the delicacy and discretion so necessary and difficult to acquire with the complicated machinery of our

modern orchestra. There also occurred some slight mistakes in the single instruments, one passage, for instance, of the horn being (if we may trust our memory, unassisted as it was by the score) missed entirely. In the first movement Mr. Manns ought to have illustrated the rhythmical accents with stronger touches. The theme—

which Liszt by the bye has also used in his setting of Lenau's ballad *Die drei Zigeuner*, is unmistakably of Hungarian or rather gipsy origin, and depends, like all the tunes of this nation, for its effect entirely on its force and originality of rhythm. Mr. Manns' conception seemed to us much too subdued in the contrasts of light and shade. About the work itself we have spoken on a former occasion (see *Academy*, vol. ii. p. 282). We repeat here that its merits rest less upon original invention than on the consistent carrying out of a poetical idea. In this respect it is very valuable as showing that even without a rich flow of melodious spontaneity, the mere dramatic force of the original conception, and its gradual rise to the climax of pathos, can engender works of the highest beauty in music.

We hope that the brilliant success of Liszt's work may encourage the authorities of the Saturday Concerts to further attempts at a more frequent introduction of modern German works into their programmes.

F. HÜFFER.

### Theology.

- A Catena of Buddhist Scriptures from the Chinese. By Samuel Beal. Trübner and Co.

THIS volume is, with regard to Chinese Buddhism, what Mr. Spence Hardy's work, *A Manual of Buddhism*, is to Singhalese Buddhism; it corresponds also to what M. E. Schlagintweit has done for Thibetan Buddhism in his book entitled *Buddhism in Thibet*. In the work before us Mr. Beal speaks but little himself; explanation and discussion occupy but the smallest of spaces. His great object is to let the Chinese Buddhist authors speak; he hides himself, as it were, behind them; and his personal work consists (besides the important and essential work of translation) in the arrangement of the different parts, and in the art by means of which he has bound them together, and has collected into one whole fragments gathered here and there.

Several of the writings quoted in this work have already appeared scattered through different numbers of the *Journal of the Royal Asiatic Society*. The author has had the happy thought of collecting them, of linking them together, and of completing them by several new translations in such a

manner as to form of the whole, that which he rightly entitles: *A Catena of Buddhist Scriptures from the Chinese*. We will not ask whether Mr. Beal has always made the happiest selection among the Buddhist literature of China; it did not perhaps depend on him to make a perfectly free choice; and it must be a chance whether an author falls on the most interesting works when he draws from a collection which "includes 1440 distinct works comprising 5586 books." Mr. Beal gives us, besides, to understand that he has not had all the facilities desirable for making very deep researches. We accept what he offers us, without complaining too bitterly in the cases where we might clearly have wished for, or expected, other things.

After some introductory remarks (1-9) in which the author insists on the help which the study of Chinese Buddhism gives to that of Indian Buddhism, on the external relations of certain institutions of Christianity and Buddhism, and finally on the necessity of being acquainted with the Buddhist religion, to act efficaciously on the minds of those who profess it, and clearly to understand the part which it plays and the place which it occupies in the "Divine strategy employed in the education of the world" (p. 7), the author enters upon his subject. His book is divided into five parts:—I. Legends and Myths. II. Buddhism as a Religion. III. Scholastic Period. IV. Mystic Period. V. Decline and Fall. A general index and an index of proper names, the latter being composed exclusively of Chinese names with the Sanskrit equivalent or a short explanation in English, terminate the book. We will proceed to give a notice of the different parts, adding to this summary some remarks.

I. The first part rests on two Chinese works, the *Fah-kai-on-lih-to*, which Mr. Beal translates "The Buddhist Kosmos, illustrated," and the *Shing-Tau-ki*, or *Memorials of the complete inspiration of Tathāgata*, with an account of Buddha Çakyamuni. It is perhaps not very natural to place under one heading two works, one of which is the description of a fantastic world, while the other, notwithstanding the many legends it contains, depends on an historical fact. The remarks with which Mr. Beal prefaces this section prove that he has felt the difficulty; therefore we will not blame him for an arrangement which was perhaps inevitable. Mr. Beal also observes that these two works belong to the *Swābhāvika* school, the ruling one in China, which teaches the eternity of matter and leads to Pantheism. Both these books are comparatively modern, and, moreover, they are very evidently reproductions. This is specially true of the first, the author of which is well known to be Jin-ch'au: he himself gives the date of his work (A.D. 1127); he treats of a subject which has nothing primitive about it; for it was not in the early times of Buddhism that its followers thought of creating a world as complicated as it is imaginary; and lastly, his book bristles with quotations borrowed from a great number of different works, which only render it the more valuable. It is curious to notice, at the opening of this book, the efforts which the author makes to demonstrate the superiority of India, and in particular the special right of the peninsula to the title of "middle country," by which the Chinese are wont to designate their own land (p. 16). But we cannot pause on all the details of the work of Jin-ch'au, on all the inventions by which the imagination of the Hindoo plays across the Unknown in time and space; we will not attempt to enumerate here the thirty-two stages of the Heavens, nor the eight burning and the eight cold Hells, nor the fields of Buddha, nor the Kalpas, or almost immeasurable periods of time. We will draw attention to a few points only.

In the midst of all these vagaries we find several times

mentioned the *Karma*\* (particularly at pages 34, 40, 86). This is explained by the close and necessary connection which Buddhism establishes between moral actions and the external condition of beings. From the moment that an almost infinite variety of worlds is admitted, these worlds must be peopled according to the consequences of the *Karma*. Buddhism entirely subordinates the physical to the moral world, and the whole system of the Buddhist world was perhaps only invented to correspond to the development of the doctrine of the *Karma*.

There is another point we must notice which is still more important, because it concerns the usefulness of Mr. Beal's work with regard to Buddhist studies considered as a whole. The Chinese author borrows continually from works of which he quotes the titles, sometimes in the Sanskrit form (which proves that he is sure of their identification), sometimes in the Chinese form, but giving either the English translation or the more or less certain Sanskrit equivalent. Now what is important, according to our views, would be to know whether the works of which he speaks correspond with known and existing works in Sanskrit, Thibetan, or Pāli.

On this point Mr. Beal gives us no sufficient enlightenment. It may have been impossible for him to do otherwise, at least in the greater number of cases; for special researches would have been necessary for the purpose: we simply state the fact. When we find quoted the *Avatamsaka-sūtra*, we identify it at first sight with the Thibetan work in the *Bka'gyur*, which bears that title; it remains to be proved whether the two works coincide. When Mr. Beal quotes the *Karunika-mahā-rāja-sūtra*, and gives the Chinese title *Jin-wang-king*, we cannot doubt the exactness of its Sanskrit translation (although the word *mahā* is not represented in the Chinese); but knowing that there are in the literatures of Nepal and of Thibet two *Sūtras*, entitled *Karunā*—and *Mahā-karunā-pundarīka-sūtra*, we see that the title of the Chinese work is not the exact equivalent of that of the two others, and we are led to ask ourselves whether we have to do with a third work, either no longer extant or not extant in other Buddhist literatures. With regard to the *In-pen Sūtra*, Mr. Beal gives us with hesitation the Sanskrit equivalent *Mahā-nidāna-sūtra*, warning us in this manner that the identification needs confirmation. It is the same with the translation *Pinḍa-dhana*, which he proposes for the work named *Lau-tan* (p. 47); but here it is probable that Mr. Beal has himself altered his own Sanskrit translation, and that we ought to read *Pinḍa-dāna*, which means, "a gift of balls of rice"—alms.

The translation "The *Sūtra of Creation*" from the Chinese *Hi-shai-king*, for which Mr. Beal gives in his index *Shrishti-Khanda* with a note of interrogation (?), shows the same uncertainty. These examples will serve to show that there is much yet to be done to prove the relations which exist between the Buddhist books of China and those of India and Thibet. Mr. Beal has felt himself hampered by this difficulty, and has had neither the time nor the means to solve it. It is only by examining and comparing the different literatures that the truth will be discovered. A mere translation of titles, however learnedly made, can but produce uncertain results.

While on the subject of Sanskrit words in Mr. Beal's work, we must remark that they are often defective. The word which he writes *Shrishti-Khanda* ought to be written *Srishti-Khanda* (or better still, *Sṛṣṭi-Khaṇḍa*); we also often meet with *rājah* and its plural *rājahs* with an *h*, which

\* It is known that this term, which signifies "act," designates the actions of intelligent beings considered in their moral value, and in the inevitable consequences, which the law of justice attaches to them.

nothing can justify; we may say the same of the *y* in *Vijñāna*. We also remark variations in the orthography: why write *sanskāra* (p. 97) when in another place we read *sanskāra*, and when the *k* is usually substituted for *c*? We will not carry these remarks any further. It is not surprising that Mr. Beal, being a Chinese and not a Sanskrit scholar, should often wrongly spell Sanskrit words; the fault is attributable rather to Sanskrit scholars themselves. When they have agreed upon the system of transcription to be adopted for the language which they make their special study, they may perhaps have a right to blame those who do not make it their special study for denaturalising words through faulty orthography.

The second chapter of the first section is, as we have already said, upon the life of *Çākya*muni. The Chinese work which deserves best to be known upon this subject is the first edition of the *Lalita Vistara*; but it is not this which Mr. Beal offers us now. If he should at some future day be able to give us this, he will render an important service to Buddhist studies. In the mean time he puts before us the *Shing-tau-ki*, composed in the seventh century by *Wong-Puh*. "It is," says Mr. Beal, "probably a copy of the first records. It claims a semi-canonical authority as belonging to the traditional or *Smṛiti* class of works" (p. 130). It is true that this work has an ancient and primitive appearance; but its date is incontestably modern.

Mr. Beal has already given the translation of this book, and of a commentary upon it, in the 20th volume of the *Royal Asiatic Society* (part ii. 1863), and to this he refers the reader, as in the present work he omits the commentary. The simple translation of the work of *Wong-Puh* would be insufficient, and far too enigmatical, if it did not relate to a subject which has been already treated several times, from divers sources, and of which the *Asiatic Journal* offers, in the volume previously quoted, a more complete exposition.

The most original part of this chapter is the discussion by which it opens (pp. 126–130) upon the name *Buddha Çākya*muni, which, according to Mr. Beal, might be of Scythian origin. The author lays much stress on the name *Çākya*, which bears no small resemblance to *Çāka*, the (Persian) name for the Scythians, and on several other particulars which he interprets skilfully. I believe that Mr. Beal is not the first to bring forward this interesting theory, which is well worthy of examination. It is plain that the etymology attributed by the Indians to the word *Çākya* is purely fanciful (like many others), but if we are to believe that the *Çākyas* came from Scythia, we must fix their arrival in India at an earlier period than 623 or 625 B.C., the date proposed by Mr. Beal; for *Çākya*muni, who died (according to the generally admitted Singhalese calculation) in 543, at the age of eighty, must have been born in 623; and it is difficult to believe that he belonged to a family newly arrived from Scythia. Indeed, and this is my strongest argument against Mr. Beal's theory, the founder of Buddhism, by his character, and the turn of his mind, appears to have been an Indian, a thorough Indian, a great deal too much of an Indian to have been a Scythian!

II. In the second section Mr. Beal commences by showing that Buddhism is really a religion, and he gives us to understand that *Çākya*muni must have gone back to anterior traditions for his doctrines; which is as much as implicitly to recognise several historic *Buddhas*: a serious question, which cannot be decided by simple suppositions. The passages quoted at the close of this exposition are—firstly, the versified and well-known adages which contain the doctrine of Buddhism; secondly, some passages relating to the four Truths; thirdly, passages relating to the Nir-

vāna; fourthly and fifthly, the *Sūtra* of forty-two sections and the *Pratimōksha*, two important works, the translation of which has already appeared in the *Journal of the Royal Asiatic Society* (19th vol. 1st series); sixthly, the daily manual of the *Shaman*, an interesting collection of the actions and sacramental words required daily from a Buddhist monk; seventhly, passages relating to the school of *Tiant'ai*. All is not equally new, nor of equal importance, although all is interesting in this collection: we will notice specially the parts not previously published.

With regard to the four Truths, Mr. Beal gives us a fragment of the *Pari-nirvāna-sūtra*. We here find a very complete and detailed exposition of the first Truth, illustrated in all its parts by those examples which the Hindoos lavish with a fertility and a sagacity peculiar to themselves, but which do not always bring with them conviction. As the proverb says, "*Comparaison n'est pas raison*." The other three Truths are scarcely mentioned by name. But we must notice another omission still more to be regretted. It is true that every writing on the subject of the four Truths is worthy of attention, and a quotation from the Chinese *Pari-nirvāna* is all the more interesting, because this work, or a work of the same title, exists in the other Buddhist literatures. But on the subject of the four Truths, these same literatures offer us a particular book, a *Sūtra* which is the first discourse pronounced by *Çākya*muni, and which is considered authentic, although each literature has its special version. Gogerly has given us the translation of the Pāli text (*Journal of the Ceylon Branch of the R. A. Soc.* No. 66). I may be allowed to remind the reader that I have myself translated or compared four versions of this primitive discourse (*Journal asiatique*, mai-juin, 1870). What does Chinese literature offer us on this point? Mr. Beal does not tell us, and yet it would be of the greatest importance to discover. There is no doubt that one at least of these writings exists in Chinese; possibly all may exist in the Buddhist literature of the Celestial Empire. They might not be easily discovered, but they are worth the trouble of seeking. We call Mr. Beal's attention to this point.

It is again the *Pari-nirvāna-sūtra* which furnishes Mr. Beal with materials on the question of the *Nirvāna*. The author begins by telling us that Chinese works generally define *Nirvāna* as the condition in which there is neither birth nor death (p. 172), a perfectly true definition, but somewhat vague, as the point precisely is to know in what this condition consists. Mr. Beal remarks in two other places (pp. 276 and 281) that Buddhism proceeds by elimination: it denies one attribute, then a second, then a third, and so on until one scarcely knows what remains; and that which remains, if indeed there remains anything, it takes care not to define clearly. The Buddhists appear to try to contradict every affirmation by a negation, and to neutralise one assertion by another. They employ to the uttermost the essentially Buddhist rule of the *juste milieu*, which in certain cases, and especially in metaphysics, consists in advancing nothing, and in ruining every argument employed by another. Who could define clearly the Buddhist "true self," or "I," of which *Buddha* affirms that it is permanent, full of joy, personal, and pure? (p. 180). These terms seem to assert in a positive manner, the persistence of personality and identity in the *Nirvāna*: but the reasoning which led to this conclusion is far from creating clear ideas; and one cannot rest on this assertion only, fully to understand the nature of the *Nirvāna*, of that "silent extinction" (*Tsih-mieh*, p. 172) which for some is a complete annihilation "*vollständige Vernichtung*" (*Wassilief*). One might conclude from the passages brought forward by Mr. Beal that

Chinese Buddhism rejects the annihilation-Nirvāna; but these writings do not include the whole of Chinese Buddhism; and it is very probable, if not certain, that the question has been solved in different ways by the Buddhists themselves. It is not easy to draw from contradictory assertions a certain and definite conclusion: *Adhuc sub judice lis est.*

With regard to the school of Tian-t'ai, which is a very important one in China, Mr. Beal gives us a description of the principal seat of this sect—an account of a visit to the central convent—also an analysis and partial translation of the principal work of its founder, Chi-kai (the end of the sixth century). This work, named Chi-kwan, or knowledge and meditation, presents the minute exactness which distinguishes Indian and especially Buddhist writers in the enumeration of all the parts of the subject treated, and in the determination of all the means it is necessary to use, most of which are remarkable only for their puerility.

III. With the third section we enter into the interminable sophistries of the Prajñā-Pāramitā, which forms in Thibetan literature so vast a compilation, yet which is capable of considerable abridgment, seeing that it may be entirely contained in the letter A.\* Mr. Beal has already published in the *Journal of the R. As. Society* (New Series, vol. i. part i.) the translation of the Vajra-tchedika and of the Prajñā-Pāramitā-Hridaya; he confines himself in his new work to short quotations from the former, but reproduces entirely the latter, which recapitulates in a felicitous manner the spirit and method of the Prajñā-Pāramitā, by collecting the principal topics of Buddhism, and by applying to them an inexorable system of negation. But the most novel and important part of this section is the translation of a long fragment of the Āraṅgama, which occupies 84 pages of the book, in small print, and reproduces about one-third of the original work. Mr. Beal seems to suppose that this Sūtra, which treats of the contemplation or ecstasy named Samādhi, may be the same as the Samādhi-Rāja: but there is nothing to authorise this supposition. The Samādhi-Rāja and the Āraṅgama both treat to all appearance of the same subject, but are two distinct works. In Thibetan, they may be found in the same volume (the 9th) in the section Mdo of the Bka'-gyur, the former at the beginning, the latter at the end of the volume, but neither the one nor the other forms part of the same section as the Prajñā-Pāramitā.

IV. In the fourth section (Mystic Period), the author, after a few words on the relations of mysticism with scholastic subtilities, sets forth the Buddhist mysticism, created by Aryadeva, a disciple of Nagardjuna, whose principal creations are Amitābha and Avalokiteśvara. Amitābha is the Dhyāni-Buddha (which one might call the mental reflection, the intellectual and mystic manifestation) of Cākyamuni. Hence the honours paid to him in China and in Japan. The abode of this personage, as mystical and imaginary as himself, is Sukhavatī. Mr. Beal enumerates the different ideas attached to the name or to the person of Amitābha. "Boundless light," such is the sense of this word. To this notion is joined that of omnipresence, which may be rendered by the name of Vairocana (although this word does not appear to bear that meaning, and we doubt the correctness of the translation which Mr. Beal gives of it, "the Omnipresent," p. 373);† that of Eternity, to which the

Chinese appear specially to attach themselves, and which the name of Amitābha appears to favour on account of the similarity between Amita, "immense," and Amrita, "immortal" (not Amirta, as we find in p. 373); and finally, that of Adi-Buddha, or the primordial Buddha. I admit that the Sanskrit term Adi-Buddha is, as Mr. Beal asserts, without sufficient proof, the equivalent of the Chinese yih-sin, "one form of existence" (p. 373), properly a single heart, or an only heart, the heart of unity. This word "heart" (one self), which is in the Sanskrit hridaya, shows in Amitābha the inner self, and leads naturally to the idea of love and compassion, which are also some of the attributes of the Dhyāni-Buddha. But as self is manifested by speech, speech is also one of the attributes of Amitābha: only under this form, he takes a distinct name and personality, and becomes a sort of "Word" (Logos) by the name of Avalokiteśvara (p. 314). It is therefore natural that Mr. Beal should pass on to this personage after giving two fragments relating to Amitābha.

Neither in the text nor in the index of Mr. Beal's work do we find the translation of the title of the works from which these fragments are taken. The first, entitled Tsing-tu-wan, appears to signify "Description of the pure earth," and the two first terms seem to correspond with the Sanskrit Ādha-bhūmi: we know no Indian work of this name, but the Chinese work being a popular book, according to Mr. Beal, may perhaps not be contained in the Buddhist canon. The second work, Wu-liang-shen-king, is a Sūtra. Mr. Beal informs us that Wu-liang-shen is the name of Amitābha taken in the acceptance of "Eternal." This Sūtra may correspond with the Amitābha-vyūha of the Thibetans, placed in the Kon-Tsegs of the Bka'-gyur (*Asiatic Researches*, vol. xx. part ii.); but as Mr. Beal calls his translation "The Western Paradise" (p. 378), the original would seem rather to correspond with the Sukhavatī-vyūha, and the opening passages seem to have reference to the details given by Csoma concerning the Thibetan work, which is the third in the 7th volume of the section (*Asiatic Researches*, vol. xx. part ii.). It is moreover possible that the Amitābha and the Sukhavatī-vyūha of the Bka'-gyur are one and the same book.

The history of Avalokiteśvara is curious. It is this divinity who comes to life again perpetually at Lhassa in the person of the Thibetan Pope, the Dalai-Lama. In China, he has become a female deity: Mr. Beal states this as a fact without giving any explanation. The name of Avalokiteśvara has also its history. The Thibetans render it by Sbyan-ras-gzigs-dwang-phyng, "The Lord who looks with his eyes." The Chinese call it Kwan-shai-yin. Kwan also signifies to look, like avalokita; but shai-yin, "world-voice," does not correspond with Içvara, the master, and some have thought that it was a corruption of Tsen-tsai, the self-existent (Içvara, p. 383). Mr. Beal refutes this opinion, and proves by various arguments, which appear to carry weight, that Kwan-shai-yin is correct, and is not the translation, as had been thought, of Avalokiteśvara, but of Samanta-mukha, another name or epithet of Avalokiteśvara, signifying "the universally manifested voice." I am not certain that Mr. Beal has fully solved the difficulties which the Chinese name of this divinity presents; but assuredly his discussion is worthy of serious consideration. With regard to Samanta-mukha, which is the title of the 24th chapter of the "Lotus of the good Law," Mr. Beal gives the translation from the Chinese version, which offers materials for a fruitful comparison with the corresponding portion of the

\* The ninth work in the section named Sher-phyin (Prajñā-Pāramitā) in the Bka'-gyur is reduced to the letter A, considered as the mother of all learning, because it represents writing and the beginning of all knowledge. (See *Asiatic Researches*, vol. xx. part ii.)

† *Vairocana* signifies "son of Virocana." *Virocana*, from *vi ruck*, signifies nothing but "to shine;" the preposition *vi* bears

often the notion of dispersion. One might translate it, "of which the light spreads itself afar," beaming. *Virocana* is one of the names of fire, the sun, the moon, &c.

French translation by Burnouf. At the end of this extract, the learned Sinologue makes us acquainted with a much less well known writing, the liturgy of Kwan-yin, a very interesting summary of a popular Chinese form of worship.

V. The fifth section (Decline and Fall) is very short, and treats of the notions foreign to Buddhism, which have been added to it voluntarily or forcibly, particularly through the influence of the Indian forms of worship of Vishnu and of Çiva, especially of the latter. This question might be treated far more fully than it has been by Mr. Beal. He has attached himself especially to a very curious point in this decadence, the worship of serpents, to which Mr. James Fergusson has already called our attention. Mr. Beal takes this opportunity to give us an interesting extract, according to the Chinese version, of the Megha-mandala-varshavardhana, the Sûtra which is repeated to obtain rain, a blessing so often needed, especially in India. He also touches in a few words on a curious and interesting question, the influence which Christianity may have had upon Buddhism (p. 412). The introduction of Christianity into Central Asia by the Nestorian missions, the traces of which were long preserved, is certainly worthy of deep study. In his introductory remarks Mr. Beal had previously spoken of what the Christianity of the middle ages borrowed from Buddhism, and we know that Mr. Max Müller has already thrown light upon one of the points which prove the connection between two religions so similar in certain features, though fundamentally so dissimilar.

There exists in this connection, and in these mutual borrowings, a fruitful source of observations, and of historical information, which will be explored at some future period when our acquaintance with Buddhism is more extended.

Mr. Beal's book is neither entirely new, as regards its component parts (seeing that he has already published some of them), nor is it fully satisfactory with regard to Chinese Buddhist literature, of which he gives us but a very partial sketch; but, considering the abundance of details and the information of all kinds which it contains; the picture of Chinese Buddhism which it presents to us, taken from the very source; the proof it furnishes of the importance of this fraction of Buddhism, and of the vast literature which is the exponent of its doctrines, institutions, and history, the book before us is of great value. It will contribute to the popular knowledge of Buddhism, and at the same time it will give valuable assistance to scholars in their work of comparing the different branches of that religion, which, having its birthplace in India, has spread itself over the whole of Oriental and Central Asia.

LÉON FEER.

### Contents of the Journals and Notes.

**British Quarterly**, January.—The theological article of this number is a curious specimen of the use and abuse of Rabbinic lore. It professes to be a criticism on *The Speaker's Commentary*, but the only considerable defect which it discovers in the first volume of that work is the neglect of Jewish tradition. Bishop Browne, for instance, and Mr. Espin, have failed to account for an inverted Hebrew letter (*Nun*); the Bishop has also committed himself to a hasty statement about "the belief of all Jewish antiquity"; while Mr. Clark has shown himself to be ignorant of the difference of opinion among the Jews of Palestine and Babylon on the subject of the Decalogue. The reviewer altogether ignores "modern" criticism, and thinks that the occurrence of the name Jehovah in the Moabite inscription is a convincing attestation of the history of Balaam.

**Theolog. Literaturblatt** (organ of the Rom. Cath. faculty at Bonn).—Dr. Ruland gives a description (Dec. 18) of an important work just published, as the result of fifteen years' toil, by Prof. E. Ranke, the fragments of an ancient Latin version of the O. T. preserved in two palimpsests at Würzburg.—Prof. Langen reviews some recent books on the Apocalypse, and (Jan. 1) the works of Weiss on St. Mark, and Godet on St. Luke.—Herr von Reumont describes (Jan. 15) researches

on the basilica of St. Andrew at Rome in two recent numbers of de Rossi's *Bullettino*, and Dr. Hartsen reviews Maudsley's *Body and Mind*.

**Zeitsch. für wiss. Theologie**, Vol. xv. No. 2.—Pfleiderer continues his exegetical studies of Pauline doctrines by an essay on Justification.—Hilgenfeld writes on the Christ-party and the Nicolaitans; the former, he thinks, stood in much the same connection with the first apostles as the latter with St. Paul.—Hitzig sums up the principal arguments against Lagarde's ingenious emendation of Isa. x. 4 in the *Academy*, Dec. 15, 1870.—Prätorius translates the book of Baruch from the Æthiopic.—Hilgenfeld continues his examination of Keim's *History of Jesus*.—Moriz Schmidt proposes an emendation of Theophilus ad Antiochum, ii. 6, p. 62 (Otto).—Siegfried reviews Cheyne's *The Book of Isaiah Chronologically Arranged*, and *Notes and Criticisms on the Hebrew Text of Isaiah*. He remarks of the former that, though the influence of Ewald is generally visible, the author has often struck out an original line of argument, and in some points of importance, which the reviewer might easily have added to, has rejected the authority of his master. The exegetical notes, a department wholly neglected by Ewald, are said to evidence wide reading and a sound critical judgment, and in general the style of the work is commended for its clearness and precision. *Notes and Criticisms* is also described as sound in method, skilful in combination, and here and there extremely acute. As to Isa. viii. 19–23, the reviewer suggests (very plausibly, in our opinion) that verses 21 and 22 should be transposed.—A. H. reviews Part I. of Ewald's work on the New Testament, and Haupt on Old Testament quotations in the Gospels; Rönsch, Lagarde's edition of Jerome's *Quæstiones et Orationes Sacra*; A. H., Lucht on the two last chapters of the Epistle to the Romans.

**Theologische Tijdschrift**, January.—Prof. S. Hoekstra gives us his thoughts on the nature and method of Theology.—Prof. Kuenen discusses an acute but over-subtle conjecture of Dr. Oort on the Beth-Ephrath of Mic. v. 1.—Among the books reviewed are *The Speaker's Commentary*, and the attempted refutations of that work by Colenso and Strange. It is intelligible that Dr. Kuenen should exaggerate the public importance of the Archbishop of York's undertaking, and equally so that he should administer a gentle reproof to such biased investigations.

Canon Perowne, the commentator of the Psalms, has favoured us with a letter on the subject of Prof. de Lagarde's "Discovery of Psalmists." He points out that it would be a surprising coincidence if, when we have but two acrostic Psalms with a supernumerary verse, the author's name should in each case be formed from the same verb *pādāh*, compounded with one of the sacred names, and "waits for further light."

Dr. Quarry, author of an able apologetic work on "Genesis," referred to as an authority by Bishop Browne, has written to complain (1) of Bishop Colenso's reproof of the Bishop of Ely for his unquestioning acceptance of the results of Dr. Quarry's analysis, and (2) of his misrepresentation of Dr. Quarry's view of the argument from the repetition of the sacred names.

Mr. Finn has published a collection of papers on *The Orphan Colony of Jews in China* (Nisbet), together with a translation of the original letter received by Mr. Layton, British Consul at Amoy, in 1850, from the Jews in Kae-Fung-Foo. It would appear that this Jewish colony dates from the close of the eleventh century of our era, and was formed by an emigration from India. The Jews of the latter country came originally from Persia; and, in fact, the colophon of the Chinese copy of the Pentateuch is in Persian (p. 65). It is strange that no mention is made of the Day of Atonement in the Chinese letter to Mr. Layton (p. 49). In the appendix Mr. Finn gives the Hebrew letter addressed to the Chinese community, to which the letter above referred to was the reply. If these Chinese Jews had understood Hebrew, they would probably have suspected the true character of their questioners.

## Philosophy and Physical Science.

**Trilobites.** Extrait du Supplément au Volume I<sup>er</sup> du Système silurien du Centre de la Bohême. Par Joachim Barrande. Prague et Paris, 1871.

THIS work comprises the author's review of his studies on the development of Trilobites in general; a chapter on the vertical distribution of Trilobites in the Silurian formation of Bohemia; a comparison of the occurrence of the Trilobites and Cephalopods in the Silurian basin of Bohemia; while a fourth chapter expounds some new palæontological views founded on his observations. His conclusions, which are strongly anti-Darwinian, demand attention on account of the author's vast experience in palæontological questions.

Notwithstanding the considerable time and attention which the author has bestowed upon this subject, he has failed to discover any evidence of the gradual development of Trilobites. Neither the modifications of the head of the different genera nor of the thorax or pygidium offer sufficient characters, and in cases where there exist intermediate forms, the great difference in the geological age to which they belong must at once cause us to dismiss all thoughts of placing them side by side. Besides this, a portion at least of the Trilobites of the Primordial fauna do not belong to the lowest organized forms of this Crustacean group, whilst the dimensions of some of the Paradoxides are only surpassed in size by very few forms of the second fauna, which belong to the genus *Asaphus*. The first appearance of nearly all genera in the first and second fauna also is not in accordance with the hypothesis, that the generic characters are developed like the specific variations by gradual changes. The non-appearance of new genera is very surprising, at a time when the order was still in full development, in the middle of the Palæozoic epoch.

According to the theory of transformation, the animal in developing itself ought to reproduce the forms of its ancestors. But Trilobites show already in some of the oldest known forms a great number of segments, whilst it is known that the embryonic forms of Trilobites possess only few segments. M. Barrande does not believe in a retrograde movement in the development of the Trilobites after the Primordial fauna, considering the great irregularity (which he shows by means of numerous tables) in the vertical distribution of this class. He devotes a chapter to the relations which are proved, by the distribution of the genera and species of Trilobites in Bohemia, to exist between the Silurian formation of that country and other parts of Europe.

He shows there is not one known genus of Trilobites in any of the Silurian strata of Europe which is not also found in Bohemia. Six genera, amongst them *Hydrocephalus* and *Sao*, are only known from Bohemia. The North Silurian zone possesses a certain anteriority as compared with that of Bohemia, as some of the Trilobite types occur lower down in Scandinavia.

Comparing the Cephalopodous fauna with the Trilobite fauna of the Silurian basin of Bohemia, Barrande finds that, besides the earlier appearance of Trilobites (the Cephalopoda are wanting in the Primordial fauna), they are also numerically by far the stronger order. Only in the third fauna do the Cephalopoda become more important and numerous in comparison with Trilobites. These two great groups show great contrasts, but it may be doubted whether the appearance of one, and the diminution of the other group, as they are entirely independent of each other, are due to changes of the physical conditions during the Silurian epoch.

The author tries to explain the appearance of species in a stratum by four hypotheses: 1. The vertical propagation of species, which range from the oldest strata to younger

horizons. 2. The filiation, which points to the development of new species out of older ones. 3. The immigration from other parts. And lastly, 4. *Renovation*. By renovation he understands the appearance of species which cannot be explained by any of the three former modes of appearances. This *generatio æquivoca* of Barrande is however entirely different from intermittence of species, which he treats in a separate chapter.

Barrande finally comes to the conclusion that most of the successive series of Trilobites met with in the Bohemian Silurian formation can only be explained on the theory of *renovation*. A very small number of species are regarded as having immigrated, but the numbers in the column of "propagation verticale" are considerable. But he holds that there is not *one* Bohemian trilobite, nor one cephalopod, which is derived by filiation (*i. e.* by descent with modification), arguing again from palæontological data, that far more forms of great geological longevity existed amongst the Trilobites than amongst the Cephalopoda. The fact that the percentage of immigrated Trilobites in Bohemia is twice as large as that of Cephalopoda, although the latter possessed far better organs of locomotion, he explains by supposing the action of strong currents in the seas of the Silurian epoch. The proportion of the genera of Cephalopoda to that of Trilobites in the Bohemian Silurian rocks is as 1 to 2.

The last chapter of the book is taken up by "palæontological theories examined in the light of facts." After an introduction, treating of the insufficiency of our knowledge of the "pre-primordial" epoch (in which he considers the Huronian system as the probable equivalent of the Upper Laurentian group), he speaks of the absence of all Foraminifera and the rare occurrence of Protozoa in the whole of the Primordial fauna; farther the absence of Corals, Conchifera, and Cephalopoda, and the absence of Heteropoda in all but the last phase of the Primordial fauna. The Brachiopoda only are well developed, although not nearly so numerous as the Trilobites. All intermediate forms between the Eozoon of the Lower Laurentian and the highly organized forms of the second Silurian fauna are therefore entirely absent. The few fossils of the Cambrian system, which ought much to be reduced in its vertical extension, and which may represent the "étage B" of Barrande, do not offer any support to the theory of filiation. Amongst these fossils are represented Brachiopoda (*Lingula*), Pteropoda, Bryozoa, Annelides, Starfishes, Echinoderms, Corals, Sponges, and plants. The absence of Trilobites in the Cambrian system is an important piece of negative evidence in respect of the sudden and numerous appearance of these Crustacea in the Primordial fauna. It is this sudden appearance of the Trilobites, repeated by the Cephalopoda at the beginning of the second, and by the Fishes at the end of the third fauna, which places the author in opposition to the Darwinian theory.

C. L. GRIESBACH.

## ENGLISH GOVERNMENT ECLIPSE EXPEDITION.

Jaffna, December 16, 1871.

THE results obtained by the several parties of the Eclipse Expedition are not yet known, and I am unable to give more than a provisional sketch of the conclusions that have been arrived at.

The members of the expedition were spread over India and Ceylon, in order to render them as independent of weather as possible. Messrs. Lockyer, Abbay, and Davis, were on the extreme left, Captain Tupman, Mr. Moseley, and I, on the extreme right in Ceylon. M. Janssen observed from Ootacamund.

The weather over the whole line of totality was excellent, and the telegrams received state that the observations made were very satisfactory.

Mr. Lockyer states that "five admirable photographs were obtained at Bekul." Also that "the polarization was atmospheric

with Savart undoubtedly, slightly radial with biquartz—1474 region very small. Respighi and myself have both obtained monochromatic images of the corona." These results are not quite in accordance with those obtained in Ceylon, but it is to be hoped that, when the reports are all received and published, the discordance may be found to be less than seems to be the case at present.

At Jaffna, Captain Fyers observed the reversion of the whole dark line spectrum just at the moment of totality, and afterwards four bright lines, C, D, 1474, and F. Captain Tupman devoted most of the time to sketching the corona, finding its structure to be most wonderfully intricate and peculiar, having bright rays both curved and inclined to the radial direction; also very deep rifts. He found the corona was visible for about 30' after the end of totality, and during this period he proved the polarization to be radial, and to extend to a distance of 35' from the moon's limb. Mr. Moseley saw no reversal of the dark line spectrum, but obtained several bright lines, and found that the 1474 line could be traced up to a height of 23' from the moon's limb. He could find no lines on the dark moon. I myself obtained distinct proof of strong radial polarization, but did not observe at a distance of more than about 12' from the moon's limb. Five extremely good photographs were obtained at Jaffna by Captain Hogg, R.E.

The sketches at Jaffna agree very well with the photographs, only differing from one another in the amount of detail introduced. A considerable change, however, is observed in the sketches made at Kokelay and Trincomalee.

The corona was most wonderfully bright, and the light during totality was quite sufficient to enable a person to read. It appeared to me of a light purple tint, and remained visible for several seconds after the end of totality.

W. J. LEWIS.

POSTSCRIPT.—According to Mr. Lockyer's letter from Ootacamund (*Nature*, January 18, 1872) all the Indian observers, with the single exception of those at Manantoddy, had good weather. He describes the corona as a star-like decoration of the purest silvery whiteness, with its rays arrayed almost symmetrically, three above and three below, two dark spaces or rifts at the extremities of a horizontal diameter. The rays are composed of innumerable bright lines of varied length. From a streamer above the point where the sun had disappeared he obtained a vivid hydrogen spectrum, with line 1474 slightly extended beyond it, very faint throughout its length, and thickening downwards like F. The C line was very vivid, as was likewise the continuous spectrum, although there was no prominence on the slit; the spectrum was undoubtedly one of glowing gas. On using the simple train of prisms of Lockyer and Young, four exquisite rings became visible, with projections where the prominences were. C came first in brightness, then F, then G, and lastly 1474. On examining the corona with the 6-inch Greenwich refractor, it was found that the interlacing filamentous structure which is so marked could not be traced to distances less than from 5' to 6' from the sun; within this region no radial character is detected.

Prof. Respighi was stationed at Poodocottah (*Nature*, January 25, 1872). One of his objects was to search for Young's, or the bright line, stratum immediately before the beginning and at the end of totality. Thirty seconds before totality the dark lines had become more strongly marked than before, and within a few seconds of totality they disappeared entirely, the spectrum becoming continuous. Like Mr. Moseley, he failed to detect the reversal of the lines which Prof. Young observed in the 1870 eclipse. The professor thinks it not impossible that the bright atmospheric light diffused over the spectrum of the solar limb may have concealed them.

After the appearance of the chromosphere at the western edge there was suddenly projected on the spectrum of the sun's limb a stratum of bright lines separated by dark spaces. They were too transient to allow the observer to determine whether they were due to partial reversal or simple discontinuity. At the instant of totality the chromosphere of the edge last eclipsed was reproduced in the four lines C, D<sup>+</sup>, F, and G, with extraordinary intensity of light. The coloured zones of the corona then increased in prominence, one in the red corresponding with line C, another in the green was probably line 1474 of Kirchhoff's scale, and a third in the blue perhaps coincides with F.

By a mishap Mr. Lockyer was unable to look for the reversal of the lines.

## THE AXIOMS OF GEOMETRY.

### TO THE EDITOR OF THE ACADEMY.

SIR,—Will you permit me to say a few words on the strictures which Mr. Stanley Jevons put forth in *Nature* for October 19, concerning my paper on the Axioms of Geometry (*Acad.* vol. i. p. 128). If I rightly understand the sense of the statements in which Mr. Jevons contests my conclusions, the point of difference between us is the following:—

Where I say that geometrical axioms are true or not true for beings living in a space of a certain description, I mean that they are true or not true in relation to those points, or lines, or surfaces, which can be constructed in these spaces, and which can become objects of real perception to those beings. To give a popular idea of the meaning of my statement, I assume that reasonable beings could live in space of two dimensions, which might be either a plane, or the surface of a sphere, or the saddle-shaped pseudo-spherical surface of which I gave a description. Beings living on a plane would have the same geometrical axioms as we find in our planimetry. Beings dwelling on a spherical surface would fail to appreciate the truth of all theorems based on the axiom that two shortest lines cannot intersect in more than one point; they could entertain no notion of parallel lines, since all the shortest lines of the space known to them would intersect, when produced, not in one only but, in two points. Beings on a pseudo-spherical surface would know of parallel lines, or lines which do not intersect; but they would find that through a given point an infinite number of lines, parallel to a given line, could be drawn. They, therefore, would consider the theorem, that through a given point can be drawn but one line parallel to a given shortest line, as untrue. The sum of the angles of a triangle bounded by shortest lines would be equal to two right angles for the first class of beings, greater for the second, and less than two right angles for the third class.

Mr. Jevons does not dispute most of my assertions. I shall confine myself to a few comments on his mode of expressing his objections. He says that the theorems of Euclidean geometry would not only be found to be *inapplicable* to spherical or pseudo-spherical spaces, but they would appear positively *erroneous* as soon as any one should try to apply the theorems respecting *straight lines* to the *shortest* or *geodetical lines* of finite length existing in those spaces. And, again, the beings living there ought to say Euclid's geometry is inapplicable to reality, because what he calls straight lines do not exist, at least not to any finite length.

As regards these points, there appears to exist no essential difference between my opponent and myself. But Mr. Jevons vindicates truth in another sense for the Euclidean geometry. Even if it should turn out to be inapplicable to the relations of the real points known to our imaginary beings, he thinks that, if they possessed human power of intellect, they ought to find out by reasoning the system of Euclidean geometry. They would, indeed, as Mr. Jevons justly remarks, if they studied the geometry of infinitely small figures, apply to them the same theorems which Euclid has laid down for figures of every magnitude.

Now, in the first place, it is evident that it is not the same thing whether Euclid's theorems be true only under very limited conditions, or for all space without exception. The geometry of infinitely small figures would be of great importance in discovering a system of geometry identical in form with that of Euclid, but truths applicable to figures of infinitely small dimensions only could not be considered as necessary truths or axioms of geometry in general.

But as we, living (at least as far as we know) in space fulfilling the postulates of Euclidean geometry, can develop analytically the system of pseudo-spherical geometry of any number of dimensions, so beings living in a pseudo-spherical space could invent analytically the system of Euclidean geometry as relating to an imaginary space not accessible to their experience; and, perhaps, they would find that the calculation of the geometrical quantities of their own space would become more simple or more symmetrical by introducing the system of variables belonging to a space of more dimensions, as we, sometimes, introduce a fourth co-ordinate into the equations of lines and surfaces in order to get homogeneous expressions, which we even differentiate with respect to this superadded variable. Our mathematicians, moreover, speak of imaginary lines and points of intersection (of two ellipsoids for instance), and their imaginary co-ordinates, as if such imaginary dimensions of space really existed; and they do this to preserve analogy and homogeneity in the analytical expressions. But for all this no mathematician

ever came to the conclusion that a fourth dimension of space exists, even though he find it convenient to write his equations as if it existed. And I cannot see why the mathematical intellects of a spherical or pseudo-spherical world should come to another conclusion, even if they should discover the simplification of their analytical geometry which they could derive from the introduction of the co-ordinates of a Euclidean space of more dimensions. Points and lines in such a space would have no more meaning to them than length in the direction of the fourth co-ordinate can have for us, although we introduce such a co-ordinate into our calculations.

I think, therefore, that Mr. Jevons does not distinguish sufficiently between the truth which corresponds to reality, and analytical truth which is derived from a hypothetical basis by a logical process consistent in itself and leading to no contradiction. For us the Euclidean geometry is true in reality: a theorem of the spherical or pseudo-spherical geometry could be called true in the second sense, when consistent with the whole system of such a geometry. For the intellects of a pseudo-spherical world, on the contrary, the Euclidean geometry would be fictitious and that of Lobatschewsky real.

H. HELMHOLTZ.

#### PROFESSOR TRENDLENBURG.

AN unusually large number of English students will receive with regret the news (which has just reached us) of Trendelenburg's death. He had attained a twofold eminence (as a philologist and Aristotelian commentator, and as an original thinker) very remarkable in the vigorous subdivision of intellectual labour which prevails in Germany at present. His metaphysical system has found many more critics than disciples: but the second of the two great impulses towards the apprehensive study of Greek thought which Germany has revived in the present century may be fairly attributed to him. Trendelenburg led, if he did not exactly create, the reaction from Hegel's Hegelianisation of the fathers of philosophy. In fact, his passionate advocacy of the real Aristotle as against Hegel's Aristotle gives the key to Trendelenburg's own metaphysics. Trendelenburg as much as Hegel refused to admit the gulf fixed by Kant between the laws of thought and the laws of being: but he equally declined to accept Hegel's novel dialectic as a substitute for both. The correspondence between the two which the Greek philosophy assumes must, he held, be accepted: but it must also be explained by the explicit enunciation of a connecting link between the mental and material worlds: such a link Trendelenburg found in motion (*Bewegung*). Many students of Aristotle who have not followed him in his metaphysical theory have joined in this reaction from Kantian formalism to the older view of logic—as Ueberweg. It is curious that Trendelenburg did not carry into his study of Kant the same perfect precision of knowledge which marks his Aristotelian commentaries: so that in his recent controversy with Kuno Fischer on Kant's conception of space the victory lies undeniably with the younger antagonist.\*

H. SIDGWICK.

#### Scientific Notes.

##### Physiology.

**The Influence of the Vaso-motor Nervous System.**—The first number of *Pflüger's Archiv für die gesammte Physiologie* for 1872 contains a long article by Heidenhain on this subject, maintaining his own conclusions in opposition to those recently advanced by Riegel in the same periodical. To give a brief summary of the results of the first series of Heidenhain's observations, we find, firstly, that excitation of sensory nerves, or of the medulla oblongata, causes a fall in the temperature of the interior of the body. This effect is occasioned by certain alterations taking place in the circulation, such as extensive contraction of the small arteries causing increased opposition to the passage of the blood. But very soon the propelling force of the heart overcomes this resistance, and an acceleration of the blood-current is induced—rendered evident in the large vessels of the extremities and head—causing an increased flow of blood to take place within a given time through the cold periphery parts of the body. A consequence of this is that a more rapid (in part at least) equalisation of temperature occurs between the latter regions and the warmer internal parts. Thus, while the temperature of the periphery of the body rises, and, consequently, the loss of heat by radiation, conduction, &c., is aug-

mented, the temperature within the body must fall. These, in few words, are Heidenhain's views, almost every point of which has been contested by Riegel. Heidenhain, since reading Riegel's essay, has corroborated the fundamental fact, that irritation, whether direct or reflectorial, of the vaso-motor centres occasions depression of the temperature of the interior of the body, by experiments on fifteen dogs. The electrical stimulus applied, he remarks, must be of *sufficient strength*; and here, perhaps, lies the discrepancy between Riegel's observations and his own. Another source of possible error on Riegel's part may arise from the region chosen for the estimation of temperature, for though there can be no difficulty in introducing the thermometer into the carotid and left ventricle, the inferior vena cava is much more likely to be missed, while insertion in a lateral channel (as one of the renal or hepatic veins) would vitiate the experiment. Riegel, moreover, used the rectum as a place for estimating the variations of temperature, and this Heidenhain, for various reasons, takes exception to. He prefers the aorta. Then the period of digestion, the degree to which the animal was subjected to the influence of woorara, or was allowed to struggle during the necessary preparations, likewise influence the result. Heidenhain brings forward a considerable amount of additional corroborative evidence, showing that depression of temperature in the interior of the body stands in direct relation to the accompanying changes occurring in the circulation; that excitation of sensory nerves, or of the medulla oblongata, increases the rapidity of the blood-current; and that excitation of the vaso-motor centres, whether direct or reflectorial, really augments the flow of blood through the periphery parts of the body. Very elaborate tables are appended to the paper.

**Contractility of Muscle Plasma.**—M. Lavdowsky, in an original communication to the *Centralblatt* (No. 49, 1871), gives the results of his researches on the protoplasm of the smooth muscle cells of the muscular tissue, and chiefly of the intestinal canal of the leech and some other annelids, which he states can easily be observed to possess contractile properties. He finds two forms of muscular elements in these animals: one forming fusiform cylinders, destitute of a membrane, and anastomosing with each other, chiefly found in the walls of the intestinal canal; the other characterized by the presence of a highly retractile and very firm layer, forming the periphery part of the muscular elements, and found principally in the skin. Both forms of muscular elements are supplied with nerves. On the application of external mechanical irritation or of induction currents the wave-like contraction of involuntary muscular fibre is not observed, but in its place a primary elongation and attenuation of the muscle cylinders may be observed, followed, after a short period of repose, by contraction and thickening. The number of contractions in the fresh fibres, when isolated, varies from 5 to 8 in the minute, but in the living animal from 10 to 20, or even from 36 to 40.

**Peripheral Distribution of Non-medullated Nerve Fibres.**—Dr. Klein contributes a good paper on the distribution of the non-medullated nerves in the *membrana nictitans*, to the January number of the *Quarterly Journal of Microscopical Science*, now edited by Drs. Payne and R. Lankester. He points out the complex structure of this membrane, and the difficulty of preparing successful specimens with chloride of gold, in consequence of almost all the elements of this tissue combining with the gold as readily as the nerves themselves. He places the perfectly fresh membrane in a one-half per cent. solution of chloride of gold for an hour, next cautiously transfers it to pure water and a bright light during several days, and then brushes off the epithelium, and mounts the specimen in glycerine. He describes four orders of nerves: the finest, which he traces to the internal surface of the capillaries and to the cells of the epithelial investment, are extraordinarily fine and delicately varicose, and can scarcely be made out with any other aid than a Hartnack's No. 8, 9, or 10 immersion lens. He is unable to confirm Pflüger's views of the connection of their fine filaments with the cellular elements of glands. He describes in full pigment cells, and the changes they undergo under various conditions, and gives, lastly, an account of the nerves of the peritoneum.

**Duration of the Electric Discharge of the Torpedo.**—M. Marey (*Comptes rendus*, lxxiii. p. 958) has applied some of his ingenious mechanical apparatus to the determination of this question, and has ascertained that it amounts to 1-14th of a second. As this is also the duration of a muscular contraction, M. Marey considers it to be a fresh argument in support of the essential agreement in the properties of the electrical organ and those of the muscles.

A paper appears in the *Journal of Anatomy and Physiology*, by Frank Champneys, B.A. of Brasenose College, "On the Muscles and Nerves of a Chimpanzee (*Troglodytes niger*) and a *Cynocephalus Anubis*." The whole of the muscular system has been worked through by Mr. Champneys in both animals with great care; but the description of the nerves is very imperfect, and is, in fact, almost limited to the branches of the cervical, branchial, and lumbar plexuses distributed to muscles. Looking at the account of the muscular system broadly, the first noticeable point is that the main masses of muscle exhibit nearly the same features in both animals, but especially in the chimpanzee, which

\* See *Academy*, vol. ii. pp. 67-69.

characterize them in man. Thus we find that the pectorales (major and minor), the trapezius, hyoid muscles, scaleni, deltoid, rhomboidei, serratus magnus, latissimus dorsi, and the principal muscles of the arm and leg, have almost identical attachments with the corresponding ones of man, or at least with only such trifling variations as might be found in different human subjects. Some interesting peculiarities, however, here and there occur. Thus both the extensor ossis metacarpi pollicis, and its homologue in the leg, the tibialis anticus, consisted in the chimpanzee of two separate bellies, having the same two insertions as the single muscle in man. In Anubis, however, the former muscle is not double. There is no extensor primi internodii pollicis in either animal. Both possess an extensor indicis, which, moreover, in Anubis, give a tendon to the middle finger. Mr. Champneys cites other authorities in disproof of the old dictum that no ape can point. The attachments of the ten interossei of the chimpanzee are carefully noted. The paper is enriched with numerous notes, which show that Mr. Champneys has very carefully studied the work of his predecessors.

### Geology.

**The Metamorphic Rocks of the Western Alps.**—Alpine geologists were formerly wont to term a number of the strata underlying the undoubted Triassic or Jurassic rocks of the Alps metamorphic rocks. It has been reserved for the present young and active generation of Alpine workers to demonstrate the fallacy of this view at all those localities where metamorphic action was said to be recognised. B. Gastaldi (in *Studi geologici sulle Alpi Occidentali, con Appendice mineralogica di G. Strüver, estratto dalle Memorie del R. Comitato Geologico d'Italia*, vol. i. 1871, Firenze) shows that in the Western Alps the Mesozoic and Palaeozoic formations rest in an unaltered condition on crystalline rocks. Among the latter he distinguishes—1. The old gneiss or central gneiss. 2. The younger crystalline shales or "pietre verdi." The latter comprise, in addition to chloritic and serpentine rocks and calcareous mica-slate, the entire mass of the younger gneisses and mica-slate, the latter often alternating with hornblende rocks. They likewise include compact granite and syenite. Gastaldi hints at analogies existing between the "pietre verdi" and the Laurentian and Huronian gneiss-systems.

**Notes on the Ak-tau and Kara-tau Mountains on the Eastern Shores of the Caspian.**—The occurrence of Liassic coal on the Caspian shore is a further illustration of the wealth of fossil fuel which the Lias of Eastern Europe and Western Asia possesses. In addition to Lias, strata of Neocomian, of Gault, and of the Sénonien, very rich in fossil remains, are, according to G. v. Helmersen (*Bull. de l'Académie impériale des Sciences de St.-Petersbourg*, tome viii. 283) met with in this district.

**Marine Shells of the Desert of Kara-Kum.**—In the sand of the desert of Kara-Kum, north of Syr-Darja in Turkestan, are found well-preserved specimens of *Cardium edule* and *Dreissena polymorpha*. Both species still live in the Lake of Aral, and in the Caspian, Black, and Mediterranean seas; so the above occurrence indicates a former eastern extension of the Aral lake. It is probable that the entire region enclosing the Aral lake, the Tscha river, and the deserts of Majun-Kum and Akkum, was covered by salt water up to the commencement of the present geological epoch (*Ibid.* tome vii. 756.)

**Loess in South Africa.**—Amongst the specimens collected by A. Hübner in South Africa were some freshwater fossils from a loess deposit near the Gokwe, a tributary of the Limpopo river. Dr. Oscar Böttger identifies them with *Pupa tetradus* and *Cionella Gokwana*. Strange to say, these forms are in no way related to the recent South African forms, but are closely allied to living European freshwater shells. (*Ber. des Offenbacher Vereines für Naturkunde*, 1871, xi. 6.)

**Fossil Fish from the Lower Carboniferous Limestone of Burdighouse.**—In the *Geological Magazine* for December, 1871, Prof. Traquair describes a new species of fossil fish, *Phaneropleuron elegans*, from the Lower Carboniferous limestone of Burdighouse. The author observes some new points in the structure of the type species of this genus (*P. Andersoni*) from the Devonian yellow sandstone of Dura Den, the most important being that the dorsal fin in this fish is prolonged as a dorso-caudal to the extremity of the body, as is the case with *Lepidosiren* and *Ceratodus Forsteri*.

**Coal in the Trap of Glenarbut.**—Thin seams of very poor coal are known to occur in beds of Trappean ash at Glenarbut, near Bowling. Mr. Young, vice-president of the Geological Society of Glasgow, has recently described in the *Journal* of that society the discovery of thin beds of indurated shale, yielding remains of fish of Carboniferous genera, associated with and overlying one of the seams of coal in this glen. In the same neighbourhood another thin seam of coal crops out at a high level in beds of Trappean ash. The woody structure of the plants constituting the coal is still clearly distinguishable, the seam in one place yielding parts of the stem of a species of *Sigillaria*.

**Fossil Man.**—Director von Hautken communicates to the Geological Society of Hungary (*Földtani Közlemény*, 1871, vii. 92) the dis-

covery in the loess deposits of Nagy Sáp, in the comitat of Gran in Hungary, of the remains of Man associated with post-tertiary remains of Mammalia. In the neighbourhood of Brúx in Bohemia an almost entire human skeleton, together with a stone hammer, have been found. The cranium closely resembles in its characteristics the well-known skull fragment from the Neanderthal. The skeleton was lying with the head raised in a sand bed of diluvial time, at a depth of two feet from the surface and overlying a bed of tertiary coal. A paper on this find by F. von Hauer occurs in the *Mitt. der anthropologischen Gesellschaft zu Wien*, December 12, 1871.

**The Peat of Austria.**—The German provinces of Austria, with Bohemia, possess peat bogs covering an area of not less than 50,000 square miles and containing about 160 million cubic fathoms of peat. In Hungary the more important moors have an area of more than 990 square miles. The Austrian peat beds have an average thickness of thirty-seven feet. (*Zeitschrift des österreichischen Ingenieur- und Architekten-Vereines*, 1871, xxii. part 14.)

**The Western Shores of Lake Ladoga.**—The investigation of the district surrounding this lake, undertaken some time ago by Inostranzef, has shown the western part of its shores to consist of rocks representing the lower group of the Laurentian system. They are chiefly grey gneiss, in which can be distinguished an older variety with white and a younger one with greenish oligoclase. Granite, with varieties of oligoclase, is found enclosed in it. Orthoclase gneiss and orthoclase granite are also met with. (*Notes on the Ak-tau and Kara-tau Mountains*, St. Petersburg, 1869.)

### Chemistry.

**The Greenland Meteoric Irons.**—These remarkable masses, to which attention has already been directed in the *Academy* of 1st December, 1871, form the subject of a paper by Prof. Nordenskjöld (*Öfvers af Vet. Afs. Förhandlingar*, 1871, 873). The occurrence of meteoric iron in Greenland is no novelty. In 1847 Rink obtained a mass weighing 21 lbs. at Niakornak. Another lump, weighing 26 lbs., and found by Rudolph, formed part of the ballast of a Greenland brig lying in Fortune Bay, not far from Godhavn. When the Swedish Expedition visited the island of Disco, the people of Godhavn were directed to search for "heavy, rounded, rusty-brown stones," and these huge blocks were eventually discovered at Ovikak, west of Fortune Bay, and between Laxe Bay and Disco Fiord. The interesting fact of their being intimately associated with and in some instances actually embedded in basalt at Ovikak (blue mountain) has already been noticed. The chemical examination of three specimens of this find is as follows:—1. From one of the largest blocks, analysed by Nordenskjöld; 2. From a small and likewise detached mass, analysed by Nordström; and 3. Iron found in the basalt, analysed by Lindström.

	1.	2.	3.
Iron . . . . .	84.49 ...	86.34 ...	93.24
Nickel . . . . .	2.48 ...	1.64 ...	1.24
Cobalt . . . . .	0.07 ...	0.35 ...	0.56
Copper . . . . .	0.27 ...	0.19 ...	0.19
Alumina . . . . .	Trace ...	0.24 ...	—
Lime . . . . .	— ...	0.48 ...	—
Magnesia . . . . .	0.04 ...	0.29 ...	Trace
Potash . . . . .	Trace ...	0.07 ...	0.08
Soda . . . . .	— ...	0.14 ...	0.12
Phosphorus . . . . .	0.20 ...	0.07 ...	0.03
Sulphur . . . . .	1.52 ...	0.22 ...	1.21
Chlorine . . . . .	0.72 ...	1.16 ...	0.16
Silica (soluble) . . . . .	Trace ...	0.66 ...	0.59
Silica (insoluble) . . . . .	0.05 ...	4.37 ...	—
Carbon, organic compounds, oxygen, &c. . . . .	10.16 ...	3.71 ...	C 2.30 H 0.07
	100.60	99.93	99.79

All three masses are nickeliferous; an unusually large though variable amount of carbon is present in each of them. They all contain chlorine, and exhibit the usual markings when etched, the iron of the basalt more especially. An exact analysis of the basalt itself cannot fail to throw light on this curious occurrence. The organic substance left in one instance, after the solution of the iron in copper chloride, amounted to 4.79 per cent., and had the following percentage composition:—

Carbon . . . . .	63.64
Hydrogen . . . . .	3.55
Oxygen (calculated) . . . . .	32.81
	100.00

**Bornite.**—In continuation of his *Recherches sur les Minéraux belges*, de Koninck, of Liège, has published a paper on the bornite of Vieil-Salm (*Bull. de l'Acad. des Sciences de la Belgique*, 1871, No. 11, 290). It

occurs in quartz, associated with chlorite and a pale blue mineral which occasionally encrusts it, and appears to be a product of the oxidation of the bornite itself; it resembles in its chemical characters brochantite or langite. The bornite has a specific gravity of 4.97 to 5.04, with a hardness somewhat greater than that of calcite. The analytical numbers agreed best with those of the bornites of Woitski, White Sea, and Bristol, Connecticut, differing but slightly from those required by the formula  $\text{FeCu}_3\text{S}_4$ . In its analysis a new method was employed which proved superior to those in general use. The finely powdered mineral was treated in the cold with a mixture of nitric acid (sp. gr. = 1.40) and bromine; the action is rapid, and the solution of the mineral in a few moments complete.

**A New Base derived from Strychnia.**—When brought together, strychnia and monochloroacetic acid combine, producing the chloride of a new base. Römer, who has described this reaction in the *Zeitschrift für Chemie*, 1871, part 14, heats three parts of the alkaloid and one of the acid for five hours at  $180^\circ$ , dissolves the product in water, separates any unchanged strychnia with ammonia, and finds the new substance deposit from the filtrate by evaporation. It is formed in this manner:

Its nitrate and oxalate are sparingly soluble in water; the chloride is readily dissolved by water and alcohol, but not by ether. Chromate of potash throws down from solutions of the base a yellow crystalline precipitate, and nitrate of silver deposits long colourless needles. In many respects the new body resembles glycocholl. It differs from brucia by 2H. The author expresses his intention to endeavour by means of nascent hydrogen to transform it into this alkaloid or an isomer.

**Silicopropionic Acid.**—A very interesting paper by Friedel and Ladenburg on this acid and its corresponding ether is to be found in the *Annalen der Chemie*, clix. 259. Silicium chloride in contact with absolute alcohol forms the chloride of triethylsilicic acid,  $\text{SiCl}(\text{OC}_2\text{H}_5)_3$ , which, when submitted to the joint action of zinc-ethyl and sodium, is partially converted into ethyl orthosilicopropionate,  $\text{SiC}_2\text{H}_5(\text{OC}_2\text{H}_5)_3$ . This ether, if decomposed by very concentrated solution of potash, neutralised with acid, and rendered alkaline with ammonia, yields a white flocculent precipitate having all the appearance of silica. This body, silicopropionic acid,  $\text{SiC}_2\text{H}_5\text{O}_2\text{H}$ , is insoluble in water, soluble in warm potash, and, like silica, separates from such a solution imperfectly by the addition of hydrochloric acid, and completely on evaporation. It differs from silica in being insoluble in soda solution even when this liquid is boiled, and in taking fire when heated. The authors ask whether the silica found in the ashes of plants exists as such in the living plant, or perhaps partially as silicon- and carboniferous compounds. It has been noticed by Sachs that plants which usually contain a considerable proportion of silica continue to thrive when deprived of it.

**Artificial Alizarine.**—It has been shown by Liebermann that the majority of artificially prepared specimens of alizarine are impure, and usually contaminated with monoxanthracinon. A new method of separating pure alizarine from the products accompanying its synthesis, and often incorrectly bearing its name, has been proposed by G. Auerbach (*Ber. Deut. Chem. Gesell. zu Berlin*, 1872, No. 18, 979). The crude alizarine is dissolved in sodium hydrate, and so removed from anthracinon, anthracene, &c. Carbonic acid is passed through the red solution, which throws down a reddish precipitate, consisting of sodium carbonate, alizarine, and sodium alizarate, while at the same time the walls of the vessel are covered with a yellow crust of alizarine. The precipitate, after frequent washing, furnishes, by decomposition with hydrochloric or sulphuric acid, alizarine in beautiful orange flocks that entirely dissolve in sodium hydrate to form a blue solution.

**An Unwritten Chapter on the Metallurgy of Iron.**—This is the title of a very interesting paper, by R. Mallet, in *The Engineer*, 15th December, 1871. His object is to show by one or two striking examples how extremely imperfect is our knowledge of ancient Oriental metallurgy. In past centuries the working of iron was carried on in India "upon a scale so stupendous as to rival the production of our largest steam-hammer forges in the Europe of to-day." By the principal gate of the ancient mosque of the Kutub, near Delhi, stands a wrought-iron pillar as large as the screw-shaft of one of our first-class steamships. Some notices of it have already appeared in the *Journal of the Asiatic Society of Bengal*. The shaft of this column is slightly spindle-shaped, and is surmounted by a capital of elaborate Indian design, carved by the chisel in the solid iron. The total height of the pillar above ground is twenty-two feet, that of the capital being three feet and a half. Its depth below the soil is greater than the height: excavations have been driven to a depth of twenty-six feet below the surface without reaching its foundation or the pillar being loosened, so that it is believed by Mr. Mallet that its entire length is not less than sixty feet. The diameter near the surface is 16.4 inches, that of the highest part 12.05 inches; it contains about eighty cubic feet of metal, and weighs upwards of seventeen tons. At its middle height is an inscription of six lines in Sanskrit, the character being that form of Nagari which has been assigned to the third or fourth century of the Christian era.

**The Synthetical Production of Organic Bodies.**—In the *American Chemist*, 1871, Nos. 4 and 5, has appeared a very instructive compilation by J. Eneu Loughlin, of the now very numerous cases of the synthesis of organic compounds. The list is very useful for reference, and for the most part complete. Under the heading *Guanidine* we find no mention of Erlenmeyer's elegant method.

### Philology.

**The Indo-Germanic Vowel System.** [*Zur Geschichte des Indogermanischen Vocalismus.* Von Johannes Schmidt. Erste Abtheilung.] Weimar: Böhlau.

THE author of this work has given proof in his previous publications of solid attainments, an acute but judicious and circumspect treatment of philological subjects, and especially of a very respectable capacity for searching and methodical argument. All these merits are conspicuous in this his latest production, and the last of them in particular in a considerably higher degree. Looking therefore at its form alone, there is much to admire in the work before us, and we can sincerely recommend it to the attention of scholars. At the same time its contents are so valuable that from this point of view also it deserves a hearty recognition. We must not indeed conceal the fact, partly due perhaps to the incomplete state of the work, that we differ on many points from the author, and still hesitate to accept some of his results, but we are bound to add that others are proved to our entire satisfaction, and seem likely to influence the course of philological enquiry.

The fundamental idea of these researches is the same which is recognised theoretically by all philologists of the school of Bopp, though it is not always carried out in practice, that Indo-Germanic speech was already a complete language when the first of its known branches parted from it, and that therefore the branches which thus parted from it received and carried with them, not radical and derivative elements distinct from one another, but these in combination as complete words, or, to put it somewhat more plainly, complete words in which radical and derivative elements were closely united. Accordingly the enquiry as to the manner in which these words became different in the sepa-

rated languages ought not to be directed to those constituent elements by themselves, but to those combinations of sounds as wholes in which the elements appear united as words. "Our task," says the author (p. 9), "is to enquire what mode of forming the present [in reference to the verb *λεπ*, Latin *lic*, Gothic *līb*, Lithuanian *lik*] existed before the separation of languages, and what relation to this is borne by those which appear in the historic periods of the life of language. The same task is imposed on us by every word which appears with such correspondence in the various languages of our own linguistic family that we cannot help regarding it as a legacy from the primitive tongue," &c. At the conclusion of the same page we read: "It is the object of the following pages to contribute to the investigation of the history of language in this sense; they aim at bringing to light, as far as possible, the influential causes of all change of vowels (we will give this name to the transitions of a root from one series of vowels to another), at fixing the epoch of each in the history of our linguistic family, whether the change occurs in the roots when still independent, or when confined by suffixes."

In the prosecution of this object the author treats, first (pp. 11-28), of "The relation of the *a* and *i* series in Slavonic," and disproves in the most convincing manner the existence assumed by Schleicher of a series produced by *a* and *i* vowels in combination. Where Schleicher sees in the relation of *ī* (*rici*), *e* (*rekā*), *o* (*po-rokū*), *i* (*pro-ricati*), *ē* (*narēkovati*) a series of increments founded on *ī*, the author shows that the vowels which appear in this series are related to each other in such a way that the *e* in *rekā*, which corresponds to an *a* in the original language, is the fundamental sound, of which the *ī* in *rici* is the weakening, the *ē* in *narēkovati* the lengthening, while the *o* in *po-rokū* is its mutation (*Umlaut*); on the other hand, the *i* in *pro-ricati* comes from the lengthening of the *ī* in *rici*.

The remainder of the part before us relates to the influence exerted by nasals on preceding vowels. The author shows how the consequences of this are the lengthening, the increment, and the qualitative transformation of preceding vowels. His researches present manifold points of contact with the works of his predecessors, but he has the merit of having considered the phenomena in a larger connection, arranged them under more general points of view, and treated them with such skill that the results obtained are of wide reaching importance not only for the development of the Indo-Germanic vowel-system, but also for the so-called variation of roots in general. He pursues these three varieties of the transformation of vowels produced by nasals in the different divisions, groups, branches, and languages of the Indo-Germanic family, e.g. the lengthening of vowels, 1, in the Aryan group; 2, in the German; 3, in the Lithuanian; 4, in the old Bulgarian; 5, in the North European group in general; 6, in the Celtic; 7, in the Latin; 8, in the Greek; 9, in the Græco-Italian (the common foundation of Greek and Latin); 10, in the European division in general. One of the most important results is the explanation of transitions from the *a*-series into the *i*-series through the influence of a following nasal, e.g. that of the *a* in *grabh*, a word of the original language, into the *ei* of the corresponding Gothic *greip* through the intermediate *grimþ*, which stands in the same relation to *grabh-nā* of the original language (this is the theme of the present of *grabh*, and becomes *griþhñā* in Vedic Sanskrit) as, e.g. the Latin *jung* in *jungo* to the Greek *ζυγ-ω*. But the importance of the book seems to us, as already indicated, to lie chiefly in the fact, that, through the researches it contains, it offers a strong opposition to the still widely spread opinion of a variation of roots in the Indo-Germanic family. The fact demonstrated by our author, that

the difference of vowels, hitherto so obscure, in many radical elements which in other respects are alike, is the result of purely phonetic and mechanical influences, renders it in the highest degree probable that the same change was brought about by merely mechanical causes in the other cases, which have not yet been explained. This result will lead to attempts to discover these causes as well as the others, and we have no doubt that the attempts will be crowned by success.

We have already indicated that many of the author's results still appear to us questionable, in particular those which relate to increments of vowels produced by the influence of nasals. To enter into details would encroach too much on the limits of this journal, and would also in our opinion be inopportune, since it is possible that these difficulties will be removed in the course of the work. In fact, the sequel will alone enable us to form a definitive judgment, and we therefore look forward with hopeful interest to its appearance.

TH. BENFEY.

Conington's *Virgil*, Vol. III., containing the Last Six Books of the *Aeneid*. Whitaker and Co., 1871.

IN the introduction to the first volume of his *Virgil*, Mr. Conington defined the scope of his edition. It was to be a commentary rather than a work of original critical research. This plan has been observed throughout; the textual criticism is merely incidental; the characteristic of the book is close and searching interpretation.

But it would be very far from true to say that Mr. Conington had done nothing for the text. The text of Virgil in its present state is one to which a scholar with the peculiar gifts of Mr. Conington could render good service without doing original work as a collator. It is a text of the same kind and in much the same condition as that of Sophokles. The number of great difficulties upon which farther light from MSS. can be looked for is very small; and the solution of the minor questions which can still be profitably discussed depends mainly on an intimate sympathy with the poet's mind and diction. The language of Virgil, like that of Sophokles, never deserts the idiom of common life, yet is always above it, being controlled by a genius at once fastidious and sane—a genius always masterly in its boldness, because always conscious of the precise limits which good taste imposes on originality. Emendation of a poet becomes indefinitely more dangerous when he is also a subtle artist in words, with a distinctive theory of expression. If a few lines from Milton, Tennyson, or Rossetti, with a few small gaps left for the purpose, were proposed for conjectural emendation by students of English, the result would probably be a help towards estimating the felicity with which confident critics have sometimes restored Sophokles or Virgil. Mr. Conington had a consummate and perfectly trained tact in language; he was an exquisite Latin composer; the sympathetic insight which was one of his chief literary gifts had long been concentrated upon Virgil; and where he had nothing positive to suggest, he could generally decide at least what was not and could not be true. The great service which Mr. Conington has done to the text of Virgil has been in protecting it, with the help of this fine and sure instinct, from the ingenious conjectures of former editors. Ribbeck's critical edition, giving collations of all the uncial MSS. and of the chief cursives, supplied the apparatus used by Mr. Conington in the *Aeneid*. But in two papers on Ribbeck's *Prolegomena*, reprinted in this volume from the *Journal of Philology* (vol. i. Nos. 1 and 2), Mr. Conington has pointed out how often he was obliged to differ from Ribbeck and others in their treat-

ment of the text. It seems to us that, in every one of these instances, Mr. Conington's judgment has been sound. To take a few examples from the last six books: in *Aen.* vii. 430, Mr. Conington defends "arma" against Peerlkamp's "arva:" in viii. 211, "raptos" against Wakefield's "raptor:" in ix. 67, "quae via" against Ribbeck's "qua vi:" in ix. 146, "sed" against Ribbeck's "sic" (who would transpose vv. 146, 147 to a place after v. 72): in ix. 676, "armis" against Peerlkamp's "animis:" in xii. 55, "moritura" against Ribbeck's "monitura." In ix. 226, "Ductores Teucrum primi, delecta iuventus," he shows conclusively that Ribbeck and Peerlkamp are wrong in wishing to insert "et" before "delecta:" and in xi. 471 *f.* rightly condemns Ribbeck's transposition of "acceperit" and "adsciverit."

It is to be regretted that the plan of the *Bibliotheca Classica* prevented the separation of the critical notes from the commentary. If the critical notes which are scattered through the commentary could have been collected and printed together immediately under the text, it would have been a great improvement. Any thorough student of a classic necessarily goes through the same process as an editor. First, he enquires how the text ought to stand; then comes interpretation, then illustration. It is inconvenient to be obliged in the first instance to disembody the critical notes from the explanatory and illustrative notes.

As in the first two volumes, the commentary is admirable in its way. Mr. Conington has described his own method of working: "My custom has been to take every line as it came before me, and to ask myself whether I thoroughly understood it." He has spoken, too, of the delight which he found "in tracing, word by word, the delicate intricacies of expression, which stimulate curiosity while they baffle analysis." The result has been that the commentary is, beyond other commentaries, the mirror of the interpreter's mind in regard to his author: it does not merely explain how he understands the hard or doubtful things: it shows how every phrase, every shade of expression, affected him. There is just one wish, perhaps a little ungrateful, which such a commentary suggests; it makes one wish for a translation, being itself, to a great extent, the rather diffuse analysis of a mental translation. Mr. Nettleship may be congratulated on having maintained, in his notes to the tenth and twelfth Books, the peculiar merits of a commentary so distinctive in character and so difficult (one would have thought) for another hand to continue. There is one difference, indeed, to be noted. Mr. Conington, as his colleague has observed, was more attracted by the linguistic than by the real side of Virgil's writings; the grammatical and literary interest predominated, for him, over the antiquarian interest. The notes to Books X. and XII., as compared with those to the other Books, show attention more evenly divided between interpretation and illustration. At the end of the volume Mr. Nettleship gives, as an excursus on Book XII., an interesting paper "On the Lengthening of Short Final Syllables in Virgil"—a paper which appeared before Corssen had published the second volume of the second edition of his *Ausprache*, but which coincides with it in its main conclusions.

R. C. JEBB.

**Manual of Old Bulgarian Grammar.** [*Handbuch der albulgarischen Sprache.* Grammatik. Texte. Glossar. Von A. Leskien, A. D. Professor der Slawischen Sprachen zu Leipzig.] Weimar: 1871.

PERHAPS nothing indicates more clearly the rapid growth of philological studies in Germany of late years than the establishment by the university of Leipzig of a professorship of the Slavonic languages—the result of a purely scientific impulse unaided and unbefriended by extraneous circum-

stances, as the reader need not be told that no love is lost between the Germans and Slavonians of the present day. On the other hand, one cannot shut one's eyes to the fact that the university just mentioned is the only one that makes serious efforts to adapt itself to the growing wants and requirements of comparative philology. Leipzig evidently means to maintain this character, for it is said that even the Celtic languages are to find a much needed refuge in that seat of learning, where no less promising a scholar than Dr. Windisch, who already lectures on them, may be expected by and by to be settled there as their professional exponent. It is just to say that in the case of Slavonic the way had been amply prepared in Germany by the labours and researches of Schleicher, and it may be gratifying to some of the readers of the *Academy* to know that Leskien is regarded by those who know him as a living Schleicher: like him he has a complete acquaintance with the chief Aryan languages, and like him he makes the Slavonic group of the same his special study. Leaving out of consideration his extensive knowledge of the non-Aryan languages of Europe, his ready and practical familiarity with the Slavonic tongues of modern times and all that is believed and written respecting them by native scholars, the fact of his being a German seems to give him a decided advantage over persons whose mother-tongue is Slavonic; for the latter seldom seem equal to the task of defamiliarising themselves with the ordinary vehicle of their thoughts, and are every now and then liable to project on a language of respectable antiquity the peculiarities of modern dialects. Even such a scholar as Miklosich sometimes shows symptoms of this kind of weakness.

Before proceeding to the *Grammar of Old Bulgarian* it may be well to show what is meant by Old Bulgarian. Now there is a dispute as to the name by which the language to which belong the oldest Slavonic documents should be called—a dispute not very unlike the following, which I take the liberty of imagining on Romance ground. Let us suppose the name Latin had not been transmitted to posterity, whereas a quantity of MSS. in that language had been preserved and the language itself continued very much what it now is, namely, the church-language of western Europe. A Spanish scholar, let us say, comes forward and says—"It is all very well for you ecclesiastics to call the jargon you read and write, mixed up with the accent and idioms of your respective nations, by the name Church-Romance, but we want the language you thus murder to be known by a name which would tell us something respecting its pedigree and relation to languages now in use: I venture to call it Old Spanish." This of course would not fail to stimulate Italian scholars to claim Latin as Old Italian, while persons not wishing to take sides in the contest would, at the risk of being inaccurate, call it the Old Romance tongue. This is very much the case with Slavonic scholars. Miklosich calls Leskien's Old Bulgarian Old Slovenic, whereas Schleicher would have it that Old Bulgarian is the more appropriate name. On the other hand, the term Old Slavonic has a tendency to spread a notion that it is equally nearly related to all modern Slavonic languages, and accountable to a certain extent for all their peculiarities and idioms, which, of course, it is needless to say, is not the case. Perhaps the name "Church-Slavonic" may still be useful as denoting that form of Old Slavonic which forms the religious language of the Greek church in Slavonic countries, and as such is, in the mouths of moderns, Russianised and Serbianised by Russians and Serbians respectively.

To place in his pupils' hands specimens of Old Slavonic purged of these local incongruities and modernisations was Leskien's object when undertaking to compile the present volume. Indeed, so great was the difficulty of procuring such

text at Leipzig last year\* that I considered myself very fortunate in being able to use this work as it began sheet after sheet to drop from the printer's hands. The critical process of arriving at something like unadulterated Old Slavonic is a difficult one, the details of which cannot help eliciting from Slavonic scholars a variety of opinions, which may in time lead to satisfactory results. One item of help is evidently a careful comparison of the chief local varieties of MSS., namely, those of Russia, Serbia, and Bulgaria. A part of the present chrestomathy has been so arranged as easily to show the contrast between these. The remaining items must be supplied by comparative philology, which establishes the general sequence of phonetic modifications nearly as irreversibly as geology does the order of the strata which compose the crust of the earth. A ready instance is that of the insertion of *l* between labials and *j*, where the sequence is easily shown to be, for instance, in the part. perf. passive of such a verb as *ostaviti*, the following—*ostavjenū, ostavljjenū, ostavljenū*. This is, by the way, a point which imparts an incidental value to the Glagolitic fashion of writing, of which Leskien has given in his Chrestomathy a short specimen for the sake of acquainting the reader with the nature of the character.

As to the contents of Old Slavonic MSS. one must frankly admit, that they contain little that would gratify the student of literature, as the majority of them are mere translations from Greek, with a few from Latin, mainly of the Bible and certain legends about saints and martyrs; at times, indeed, the rendering is so literal as to make but suspicious Slavonic, not to mention a multitude of compound terms which probably would never have existed but for their Greek originals. In fact, one may say that the student of Old Slavonic must continually correct his results by an equation of errors based on the data of the Slavonic languages which are still in use.

The Chrestomathy is, as might be expected, accompanied by a copious glossary which makes it easily used. This completes Leskien's original plan: afterwards, however, he was induced to premise a succinct account of the phonology and inflections of the language. All that is done in a scholarly way, and none of the latest results of philological investigations, as far as they have a bearing on the matter in hand, have been overlooked. It is much to be regretted that the author did not think it necessary to supplement this part of the book by a discussion of the structure of words and sentences in Old Slavonic: let us hope that in some shape or other this will by and by be done by him. However, the book as it is, cannot but be highly convenient and perfectly indispensable to such students of Aryan philology as cannot afford to make the Slavonic languages their special study.

J. RHYS.

#### TO THE EDITOR OF THE ACADEMY.

SIR,—Professor Lushington, of Glasgow, has requested me to state that the retention of the word *ἐπιγυβαλον*, in *Soph. Oed. Col.* 1491, is not due to him but to Hermann, who suggested this in his edition of 1841.

Professor Lushington mentioned this to me, together with an original suggestion of his own, respecting the metrical arrangement of the passage, which he reads thus:—

ll. 1492, 3:

ἐπιγυβαλον ἐναλίφ  
Ποσειδανίφ θεῖφ τυγχάνεις,

answering to ll. 1479, 80:

διαπύρσιος ὕποβος γ-  
λεως δαίμων ἴλεως εἴ τι γῆφ.

Hence my mistake, which I trust you will give me the means of correcting, by inserting this in the next number of the *Academy*.

St. Andrews, January 17, 1872.

LEWIS CAMPBELL.

\* This was written in 1871.

#### Notes and Intelligence.

*Popular Tales and Epic Poetry (Volksmärchen und epische Dichtung)*, a lecture, by Theodor von Bernhardi, is a popular introduction to the attractive branch of philology which deals with the origin of the narrative element in literature. The true "Mährchen"—our term "fairy tale" is too narrow, and "popular tale" is too vague—is in its essence a fragment. Even if the incidents are worked into a complete story, there is always a supernatural element which remains unexplained, not because it is supernatural, but because it comes from a whole world of mythology long since forgotten. It often contains, moreover, an element of primitive history—not, perhaps, the traces of actual events, but of custom or feeling or local association—which remains in it as something taken for granted but no longer understood. The *Germania* of Tacitus gives the key to many stories in Grimm. The position of women, their knowledge of writing and of medicine (both regarded as magical arts), the golden hair of the Teutonic races, the divinity of the hearth and its fire, the sacredness of the horse—such points can be shown to underlie many of these tales, even in the forms in which they are still told. It appears, however, that all "Mährchen" may be traced back to older "Sage:" that is to say, to traditions which are attached to a particular place or to the name of a historical person. Stories which are simple and childish in Grimm re-appear as heroic legend in the Icelandic cycle of the *Edda*, where they fall into their place in a general system both of mythological belief and of historical or quasi-historical events. The full explanation of "Sage" would consist in the separation of the historical from the mythological element: and this is seldom possible. So long as two things co-exist in unknown proportion, neither can be said to be completely determined. Much, however, may be done by comparing the different versions of a story, and thus freeing it from the admixture either of distinct legends or of later historical colouring. Herr von Bernhardi gives a good example in the Norwegian story of the two giants who find the husbandman ploughing, and know that their time is come to leave the country. In this, as he shows, we have the notion of an age of chaotic natural forces followed by that of gods and men. The same story is found again in Alsace: and there the giant, like the feudal lord, lives in his "rocky nest" supported by the husbandman's labour. Instead of primitive cosmogony we have as the *motif* the social contests of feudalism. The process by which ancient "Sage" becomes the matter of epic poetry is shown in two instances—the *Nibelungenlied* and the story of Lohengrin. The former has probably interwoven some great disaster of the Burgundian kings, and one or two historical names such as Attila and Theodorich, with the purely mythical stories of Siegfried and Brunhild. The latter is found in a Low German poem of the thirteenth century, in a form which makes Lohengrin a knight of the Sangraal, thus mixing his story with the Celtic legends of the Arthurian circle. There is a Flemish version, however, which knows nothing of the Sangraal, and turns on the Teutonic fancy of the swan-maidens. Herr von Bernhardi endeavours to show, in conclusion, that the greatness and enduring charm of epic poetry depends upon the relation in which it stands to the national tales and legends, and through them to the whole previous life of the nation. It follows that true epic poetry can only be produced in an "Urvolk:" that is to say, in a nation that has undergone no violent revolution in language or institutions. The *Nibelungenlied*, however, is rather to be considered as an interesting specimen of national poetry than as itself a poem of the highest order.

D. B. MONRO.

We have received the first number of a new Hungarian periodical entitled *Magyar Nyelvőr*, "Hungarian Speechwatch" (Germ. *Sprachwacht*). The function it proposes to discharge, the censorship of the current Hungarian language, is one of great importance in a country where the great majority of writers are even more under foreign (*i.e.* German) influence than is the public which they address. The programme of the *Nyelvőr* enumerates as within the sphere of its operations:—(1) The history of the language, pointing out the wealth of words contained in old books, documents, &c., especially in words whose revival may increase the present resources of the language. (2) The collection of materials for a fuller and more exact knowledge of the language of the peasantry in its various dialects, including among such materials songs, proverbs, toasts, nursery rhymes, and the local names of hills, valleys, streams, &c. (3) The criticism of the language of current Hungarian literature, including newspapers, with especial reference to the invention of words at variance with the true genius of the language. (4) The determination of questions relating to the peculiarities of the language, its syntax, the distinction of synonyms, and such like. (5) Notices of such discoveries in the field of philological enquiry as bear on the Hungarian language. Besides this programme the first number contains a defence of the title by the editor, M. Szarvas, from the charge of Germanism brought against it by a contributor. Dr. Budenz contributes two articles. The first points out as a defect of Hungarian grammars that they do not distinguish between those etymological suffixes which can still be used to form new words and those which have, so to say, become barren and incapable of entering

into new combinations. Dr. Budenz' second article criticizes from a philologist's point of view a recent republication of a work of Unitarian controversy belonging to the sixteenth century. Among the remaining contents of the number we notice a contribution by M. Paul Hunfalvy on the old Magyar calendar, an analysis by the editor of the language of Petöfi's *János Vitéz*, and a choice anthology of bad Hungarian culled from the newspapers. The *Nyelvtör* is to appear on the 15th of every month, with the exception of August and September. We wish it all success.

Readers of the *Rheinisches Museum* will rejoice to hear of the publication of a complete index to the first twenty-four volumes. The index seems very complete, and forms by itself a volume of 176 pages.

*Vocabulista in Arabico*, pubblicato per la prima volta sopra un Codice della Biblioteca Riccardiana di Firenze da C. Schiaparelli. (Firenze, 1871.)—This is an old Arabic vocabulary in two parts, Arabic-Latin and Latin-Arabic, discovered in the Riccardiana library at Florence, by Sig. Amari, and now edited for the first time by one of his pupils. The date of its compilation is uncertain, but Amari refers the manuscript (which is evidently not the original) to the end of the twelfth or beginning of the thirteenth century. Between the two glossaries is a controversial dialogue, in pointed Arabic, between a Moslem and the author of the *Pugio Fidei*, Raymond Martin. A notice of the work by Sig. Lasinio is given in the *Nuova Antologia* for October, from which we derive these facts. The editor appears to have performed his task well, and the result is a not unimportant addition to our scanty information respecting the Arabic dialect of Spain.

At a meeting of the Bombay branch of the Royal Asiatic Society held on the 9th November last, Dr. Bühler read a paper on Śrīharsha, the author of the *Naishadha-charita*, a work of which that scholar is preparing a new edition for the Bombay Sanskrit Series. The account given by Dr. Bühler of the writer is mostly taken from the *Prabandhakosha*, composed in A.D. 1348, by Rājasekhara, a Jain writer. Śrīharsha is there said to have been born at Kāśī (Benares), and composed his work at the request of King Jayantachandra, the son of Govindachandra. From the reasons adduced by Dr. Bühler, it seems very probable that the patron of Śrīharsha was no other than Jayachandra, who reigned over Kanyakubja (Kanauj) and Benares in the latter half of the twelfth century (probably from A.D. 1168-1194).

### Contents of the Journals.

*Zeitsch. der deutsch. morgenländ. Gesellschaft*, Vol. xxv. No. 3.—The explanation of the Avesta, by Fr. Spiegel. [A reply to Roth's remarkable paper in the last number.]—Poem of Jacob of Sarug on the palace which St. Thomas built in India, published by R. Schröter.—History of the translations from Indian into Arabic, and their influence on Arabic literature; with especial reference to the moon-stations (Naxatra), and treatises on lots; corrections, additions, and index to vols. xviii. and xxiv.; by M. Steinschneider.—A Nabathæan inscription from Ammonitis, deciphered by M. A. Levy. [See Quarterly Statement of the Palestine Fund, No. vi.]—"Authorship and Translation," how expressed in Hebrew, by Dr. Zunz.—The criticism of the Biblical Assyrian chronology, by Dr. Schrader. [The author explains his grounds for rejecting M. Oppert's attempt to bring the lists of Assyrian eponyms into harmony with the chronology of the Books of Kings.]—Unpublished strophes of various poets, continued, by Th. Aufrecht.—Additamenta on the inscription of Meshā, by C. Schlottmann; vi. Fixation of the text, a letter to Prof. Hitzig.—A Hebrew book from Calcutta, by Dr. Geiger. [A modern collection of liturgical songs.]—Contributions to the knowledge of the geographical and linguistic relations of S. Arabia, by H. v. Maltzan. [The author made the acquaintance in Cairo of a number of Arabs from the south, from whom he gained much information as to the dialect of Hadramaut, &c. The pronunciation of the latter bears a close resemblance to that of the dialect of the Fellahs. The *casus rectus* of the plural is still in occasional use, and is not quite expelled by the *casus obliquus*, as in almost all the other dialects. There seems, too, to be an extraordinary similarity between many expressions of the Algerian and the southern Arabic dialect. The accuracy of Wrede's geographical statements is confirmed.]—Explanations with Dr. Blau, by F. Prätorius.—Two Jewish physicians, by M. Steinschneider.—On the radical meaning of שָׁרָא, by G. M. Redslob.—Reviews:—*Spiegel's Eran. Alterthumskunde*, and Kuhn's *Kaccayanae Namakappa*, by A. W.—*Bickell's Conspectus*, by Geiger.—Wright's *Catalogue of Syriac MSS.*, part ii., by Nöldeke and Geiger.

*Tijdschrift voor Indische Taal-, Land- en Volkenkunde*, Batavia, serie vi. deel i. (1870).—Afl. 1 and 2.—Hindoe-monumenten in de bovenlanden van Palembang, als bron van geschiedkundig onderzoek, door E. P. Tombrink. [The inhabitants of Palembang, the north-eastern part of Sumatra, are said to be a mixture of Hindus, Javanese from Modjopahit, and Malaysians from Menangkabau. From the monuments discovered, and of many of which plates are given along with this paper, the writer maintains that the Hindu

settlers were principally worshippers of Siva, though not of the Linga. The remains mostly found on plateaux commanding extensive views are said to represent Siva, Durgā, Ganesa, and Nandi, the bull. From their being of a much ruder character than those found in Java, he feels inclined to assign a much earlier date to them, and to assume that a direct immigration from the Indian continent to the east of Sumatra took place during the earlier centuries of our era. For the aboriginal inhabitants of these parts he looks to the Orang Koeboe, still subsisting in the jungles, and probably akin to the Dajaks of Borneo.]—De Landschap-pen Holontalo, Limoeto, Bone, Boalemo en Kattinggola, op Andagile, geographische, statistische, historische en ethnographische aantee-keningen door J. G. F. Riedel. [The districts here described form the central part of the northern neck of Celebes.]—Review, by A. B. Cohen Stuart, of *Geschiedenis van Java*, door J. Walbers. *Erste deel*. *Oude Geschiedenis: Vor-Hindoe- en Hindoe-tijd; Middengeschiedenis, Mahomedaansche staten*. Utrecht, 1868. [Very unfavourable.]—*Verslag van eene Reis van den Assistent-Resident van Benkoelen naar het eiland Engano*. [The inhabitants of this island, situated south of Sumatra, are described as differing greatly from both the Malays and Bataks, and to have more of the Nias race in their appearance.]—*Aflevering 3. Geschiedenis der Soenda-Landen*. Hoe het land van Soenda onder het oppergebied van De Compagnie kwam. II<sup>e</sup> periode. *Derde tijdvak*. Door J. Hageman.—*Soendasche Spreekwoorden*, door K. F. Holle. [Continuation; containing 160 proverbs in the Sunda dialect, with a literal translation and an explanation.]—Review, by A. B. Cohen Stuart, of *Vervolg op Dr. J. F. C. Gericke's [and T. Roorda's] Javaansch-Nederduitsch Woordenboek*, zamengesteld door P. Jansz, Evangelie-zending op Java. Samarang, 1869. [Very favourable.]—*Aflevering 4 and 5. Enige opmerkingen op drie kleine geschriften, waarmede de heer Klinkert als schrijver is opgetreden*, door H. van de Wall. [The papers of H. C. Klinkert, printed in the *Bijsdragen tot de Taal-, Land- en Volkenkunde van Ned.-Indië* (1866 and 1868), and severely criticized and annotated upon in this article, are:—1. *Jets over de Maleische school- en volksleesboeken*; 2. *Enige Maleische spreekwoorden en spreekwijzen*; 3. *Opmerkingen op Dr. J. Pijnappels Geographie van Nederlandsch-Indië*.]—*Chronologische lijst van gedenken- en legpenningen, &c.*, door J. S. van Coevorden. [Continuation.]—*Brieven van H. N. van der Toek betreffende het Lam-pongsch*. [These letters contain various contributions to the knowledge of the dialect of Lampong, the south-eastern extreme of Sumatra, consisting of lists of words, bits of poetry and prose, sayings, &c.]—*Aanteekeningen over de hoofd-tempels in Kadoe en Djokdjokarta*. Door R. H. T. Friederich. [The temples of Boro Boedo, Mendoet, Prambanan, Plawassan, and others at the foot of the Merapi (in Java), show Buddhism to have been the more favoured creed during the times when these monuments were erected (the inscriptions found vary in their dates between A. Saka 746 and 870), though the Saiva creed was still prevalent among the mass of the people, and some of the remains exhibit a curious amalgamation of Brahmanical and Buddhist mythology.]—*Kitab Pakih Soenda*, door J. J. van Limburg Brouwer. [A theological Sunda text, by an unknown writer, transcribed in Roman characters, with a Dutch translation.]—*Snippers*. Door K. F. Holle. [Continuation. Notes on the views and manners of the natives of the Indian Archipelago.]—*Over de spelling van het Soendaneesch met Latijnsch letterschrift*, door G. J. Grashuis. [Rigg's and Holle's methods of transcription are here compared, and the latter is adopted, with slight modifications, as the more useful.]

*Bijsdragen tot de Taal- en Volkenkunde van Nederlandsch-Indië*, vijfde deel, 3<sup>e</sup> stuk ('s Gravenhage, 1871).—Stukken betrekkelijk de verdediging van Ternate door den Gouverneur Willem Jacob Cranssen, 1800-1801, en de overgave van het Gouvernement aan de Engelschen, &c.—Zesde deel, 1<sup>e</sup> stuk, 1871.—Reports of meetings, &c.—*Transcriptie van Indische Plaatsnamen*.—Korte opmerkingen over Balineesch en Kawi, door H. Kern. [Notes on the etymology and meaning of some Balinese and Javanese words.]—*Varia*. Door v. L. B. [On Dr. Socin's discovery of the Syriac text of Kalila and Dimna. On Kawi inscriptions. Notices (favourable) of Prof. H. S. Maine's Lectures on Village Communities in the East and West; and T. T. Cooper's Travels of a Pioneer of Commerce in Pigtail and Petticoats; or, an Overland Journey from China towards India.]

*Journal Asiatique*, No. 65.—Rapport sur les Travaux du Conseil de la Société asiatique pendant l'année 1870-1871, par M. E. Renan. [Opens with a tribute to the memory of deceased members of the society, especially MM. Caussin de Perceval and Deveria. Semitic and Egyptian studies have been less disturbed by political events than Indo-European. We notice that M. Renan discovers in the Himyaritic monument, published in the *Journal* by M. Ganneau, a resemblance to the Buddhist bas-reliefs representing the life of Sakya-muni.]

*The Pandit*, vol. vi. Nos. 64-67 (Benares, Sept.-Dec. 1871).—The Tarkapāda of Gāgābhāṭṭa's Bhāṭṭachintāmaṇi, ed. Bālaśāstrī. [Concluded in Nos. 64 and 65.]—Amarachandra's Bālabhārata. [The forty-fourth and conclusive sarga. (No. 64.)]—The Tattvavaktūvālī, a Vedāntic treatise by Pūrṇānanda, ed. Vechanārāmasarmā. [Comp. in No. 64.]—The Gopālālīlā, a poem by Rāmachandra, ed. Vechana-

rāma. [Sargas 1-8 (Nos. 65-67).] — The Viddhaśālabhanjikā, a drama by Bālakavi, ed. Vāmanāchārya. [Acts 1-3, in Nos. 65-67 resp.]—The Aphorisms of the Yoga Philosophy of Patanjali. The Sanskrit text and an English translation of the Sūtras and Commentary. By G. D. [Continued from Book IV. Aph. 19-33.]—The Vaiśeṣika Aphorisms of Kaṇāda. The Sanskrit text and an English translation of the Sūtras and Commentary. By A. E. G. [Continued in No. 64 and 67, from Book I. Lesson 1, Aph. 2-15; Lesson 2, Aph. 1 and 2.]—Translation of the Siddhānta-Muktāvalī's explanation of verses 11 and 12 of the Bhāṣā-Parichchheda. By A. E. G.—Catalogue of Sanskrit MSS. [Continued.]

Revue Critique, Jan. 6.—H. Weil reviews Hense's *Heliodoreische Studien*, introducing some valuable remarks of his own on the subject of Heliodorus.—Ch. Thurot examines the second part of Lübbert's *Grammatische Studien* (treating of the construction of the Latin *quum*), and pronounces it a careful summary of the facts, though disagreeing with the writer's method and controverting his conclusions. But surely M. Thurot goes to the opposite extreme, and exaggerates the uncertainty of the subject, when he says, "le subjonctif est un luxe du langage."—Jan. 13.—The philological articles in the number are a notice (anonymous) of a dissertation by Th. H. Martin (the well-known editor of the Timaeus) on certain optical instruments erroneously attributed to the ancients; and an elaborate and discriminating account (by Ch. Morel) of our chief modern histories of Roman literature, those of Bähr, Bernhardt, Hübner, and Teuffel: a French work by M. Paul Albert on the same subject is likewise briefly noticed.

Rheinisches Museum, vol. xxvii. pt. 1.—A. Rapp: The Maenads in the Greek worship, in art and poetry (Part I).—E. Rohde: The sources of Iamblichus in his Life of Pythagoras (conclusion). [Points out his debt to Apollonius and Nicomachus, and indirectly to earlier writers.]—J. Steup: Reply to Teuffel's *Probus in Martial und Gellius*.—C. Wachsmuth: Scattered fragments of the *Eclogae* of Stobaeus in his *Florilegium*. [Contains most important suggestions for the restoration of the *Eclogae*.]—G. Krüger: On Horace. Defends his emendation *tu liques in Od. i. 20, 10*; and in *Sat. i. 6, 14*, proposes to take *notante iudice quo nōsti populo* as = *quam notantem iudicem quem nōsti populum*.—F. Blass: On Antipho. [On the text in the MSS.]—W. Teuffel: The *Historia Apollonii regis Tyri*. [Shows amongst other things that the Sloane MS. has been underrated by Riese.]—F. Ritschl: The *Persae* of Aeschylus in Egypt: a new Simonideum. [Describes a newly discovered MS. and shows very conclusively that it is a modern fabrication. It is not very reassuring to find that possibly the famous Simonides is still living and engaged in literary work for the Russian government!]—F. Bücheler: *Inscriptiones latinae iambicae*. [Specimen of an edition of a Latin Anthologia epigraphica.]—J. H. Mordtmann: Greek inscriptions from Arabia.—F. Rühl: Pompeian inscriptions.—W. Helbig: Hiero II. and Philistis on a relief from Agrigentum.—M. J. Höfner: The contemporary history in Dio Cassius.—F. Rühl: On Zosimus.—K. Dziatzko: *Hauton timorumenos* or *Heauton timorumenos*? [Terence wrote in all probability *Heauton*.]—L. Müller: The Neapolitanus of Propertius. [Corrects a remark of Haupt.]—N. Wecklein: On Sophocles and Euripides.—C. Badham: *Philippi Platonici emendationes*.—M. Voigt, J. Vahlen, O. Ribbeck: On Plautus.—O. Ribbeck: On Lucilius and Coniecturae Suevianae.—L. Müller: On Catullus, &c.—E. Bährens: On Ovid and Calpurnius.—J. Vahlen: On Cicero.—F. Ritschl: Canticum and Diverbium in Plautus.

Zeitschrift für die österreichischen Gymnasien, xxi. 7 and 8.—J. La Roche: Die Trithemimeres im Homerischen Hexameter. [Carefully classified lists of instances of short syllables lengthened in the second arsis: the text is often corrected by the help of Professor La Roche's collations.]—F. Krones: Zengenverhör über Baumkircher's Thatenleben und Ende. [Holds that the current view of this Styrian hero is not historical at all, but traditional, and quite erroneous.]—Anthologia latina, fasc. i. recens. Alex. Riese (Teubner), rev. by Mähly. [Suggests a number of conjectures, more or less probable.]—Georg Curtius: Erläuterungen zu meiner griechischen Schulgrammatik. Rev. by Hartel. [Neither Kühner nor Westphal has produced a satisfactory grammar for modern requirements. The reviewer makes many valuable remarks, especially on the importance of linguistic knowledge for Homeric prosody, often thought to be full of mere irregularities.]—Corn. Taciti Historiarum libri qui supersunt. Schulausgabe von Heräus. 2. Bd. Lib. iii.-v. (Teubner series, with German notes.) Rev. by Prammer. [Not so conveniently arranged for a school book as Dräger's *Annals*, in the same series. The notes on the history and geography are good; but the book shows a want of form, and is marred by many misprints.]—Meister: Ueber Dares von Phrygien, *de Excidio Trojae historia*. Programm. Rev. by Schmidt. [The writer, who is preparing an edition of Dares for the Teubner series of texts, gives us here the results of his examination of the MSS. They are greatly corrupted through the popularity of Dares in the middle ages, with the exception of one MS. B. at Bamberg. Meister also deals with the literary history of this curious composition.]—Blass: Ueber die Aussprache des Griechischen. Rev. by Hartel. [Justly praises this little work,

which treats of the main points of the question, and establishes the claims of the Erasmusian against the Reuchlinian pronunciation in a learned, original, and convincing manner.]

Philologischer Anzeiger, iii. 7.—R. Kühner: Ausführliche Grammatik der griechischen Sprache. 2. Aufl. [Re-written, incorporating the results of modern linguistic science, in a form that is of great practical value, if not always perfect in point of scientific statement.]—W. Büchner: Die Ebene von Troia. [Seems to proceed on a false method.]—M. Vermehren: Platonische Studien. [Discusses 118 passages, chiefly from the Symposium, Republic, Laws, and Phaedo. The reviewer, D. Peipers, goes over the greater part of them.]—C. F. G. Meutzner: De interpolationis apud Demosthenem obviae vestigiis quibusdam. [Applies this way of getting rid of difficulties to passages especially of the Olynthiac and Philippic orations.]—A. Hug: Commentatio de pseudo-demosthenica oratione adversus Zenothemin. [Pronounces it a forgery by a person of little acquaintance with judicial or commercial affairs.]—Index lectt. in univ. Berolinensi per sem. hibern. 1871-72 habendum. [Contains a dissertation by M. Haupt, giving specimens of dialogues, Greek and Latin, from a MS. of the ninth century, and promising a complete collection.]—G. Studemund: Emendationes Plautinae. [Results of the laborious care bestowed by Studemund on the Ambrosian codex.]—P. Willems: Les antiquités romaines envisagées au point de vue des institutions politiques. [Intended for students of jurisprudence.]—H. Th. Plüss: Die Entwicklung der Centurienverfassung in den beiden letzten Jahrh. der römischen Republik. [Places the reform in 241 B.C., and agrees with Niebuhr and Puchta against Mommsen, Lange, &c. in supposing 70 centuries. The writer's own theory of a complete change made in 179 B.C. in the nature of the classes is not borne out by Liv. xl. 51.]—G. Kramer: Carl Ritter, ein Lebensbild.—iii. 8.—Reviews several Homeric dissertations, of which those of E. Kammer ("obelising" the scene with Aeneas, ll. 20, 79-352, and the Battle of the Gods, ll. 20, 32-72; 21, 391-518) and K. Weidenkaff (on the use of the genitive) seem the most important.—Fr. Heimsöth: De vitiorum in veterum scriptorum codd. obvivorum generibus a Madvigio Hauniensi nuper definitis. Rev. by E. v. L. [Valuable criticism of Madvig's book.]—R. Petersdorf: Diodorus, Curtius, Arrianus quibus ex fontibus . . . hauserint. Rev. by E. S.—H. Kühlewein: Observationes de usu particularum in libris qui vulgo Hippocratis nomine circumferuntur. [Careful and methodical contribution.]—J. Caesar: Conjectanea critica. [Chiefly on Galen and Plutarch.]—H. Holzer: Der Hildesheimer antike Silberfund. Rev. by L. G. [Believes that it was originally the plate used at the table of Germanicus.]—K. Woermann: Ueber den landschaftlichen Natursinn der Griechen und Römer. Rev. by L. Schmidt. [Distinguishes well between sympathy with individual objects in the world of nature, shown in fables, similes, &c., and feeling for landscape proper; regards the latter as very much the growth of the Alexandrian period, but underates too much the feeling shown, e.g. in the Phaedrus of Plato, and by Aristophanes and Pindar.]—R. Sohm: Die altdeutsche Reichs- und Gerichtsverfassung. Bd. 1: Die fränkische Reichs- und Gerichtsverfassung. [An important and valuable work, intended to supplement the works of Waitz and Roth. Carries out the proof that the early condition of the German races was one of order and advanced constitutional development. Holds that the assembly of the *centena*, the *pagus* of Tacitus, was only judicial, and without political functions, the political unit being even then the *civitas*.]

### ERRATUM IN No. 40.

P. 26, col. 1, line 37, for "in the same place" read "in the *Revue des deux Mondes*."

\*.\* It is particularly requested that all applications for back numbers, extra copies, subscriptions, advertisements, &c. be addressed to the Publishers, not to the Editor.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 42.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The next number will be published on Friday, March 1, and advertisements should be sent in by February 26.*

The Second Volume (October 1870 to December 1871) is now ready, bound in cloth, price 18s. Covers may be had of the Publishers, price 2s.

## General Literature.

La Réforme intellectuelle et morale de la France.  
Par Ernest Renan. Paris : 1871.

BURKE says, speaking of himself :—

"He has never professed himself a friend or an enemy to republics or to monarchies in the abstract. He thought that the circumstances and habits of every country, which it is always perilous and productive of the greatest calamities to force, are to decide upon the form of its government. There is nothing in his nature, his temper, or his faculties, which should make him an enemy to any republic, modern or ancient. Far from it. He has studied the form and spirit of republics very early in life ; he has studied them with great attention ; and with a mind undisturbed by affection or prejudice. But the result in his mind from that investigation has been and is, that neither England nor France, without infinite detriment to them, as well in the event as in the experiment, could be brought into a republican form, but that everything republican which can be introduced with safety into either of them must be built upon a monarchy."

The name of Burke is not mentioned in M. Renan's book, but it is difficult to believe that Burke's publications of eighty years ago on the French Revolution, from which we have quoted the foregoing passage, were not in M. Renan's hands when he wrote his recent work. If it was so, it detracts nothing from M. Renan's originality ; a man of his powers cannot but be original in the treatment of his subject, and to have read and agreed with Burke will not make him less so. But the similarity of the point of view strikes the reader in almost every page ; and certainly it will be no bad effect of M. Renan's book if it sends us back to those masterpieces of thinking and eloquence, the *Reflections on the Revolution in France*, the *Letter to a Member of the National Assembly*, and the *Appeal from the New to the Old Whigs*. They are far too little read. They need to be received with discrimination and judgment, and to common liberalism they can never be acceptable ; yet so rich is their instructiveness that a serious politician could hardly make a better resolve than to read them through once every year.

"You have industriously destroyed all the opinions and prejudices, and, as far as in you lay, all the instincts which support government."  
"You might, if you pleased, have profited by our example. You had the elements of a constitution very nearly as good as wished. You possessed in some parts the walls, and in all the foundations, of a noble and venerable castle. You might have repaired those walls, you might have built on those old foundations. You had all these advantages in your ancient States ; but you chose to act as if you had never been moulded into civil society, and had everything to begin anew."  
"Rousseau was your canon of holy writ."

These sentences are Burke's, and never surely could he have desired a better testimony to his wisdom than for a

VOL. III.—NO. 42.

man like M. Renan to say eighty years afterwards, with the France of the present moment before his eyes :

"If no more had been done at the Revolution than to call together the States-General, to regularise them, to make them annual, all would have been right. But the false policy of Rousseau won the day. It was resolved to make a constitution *à priori*. People failed to remark that England, the most constitutional of countries, has never had a written constitution, drawn out in black and white." (P. 7.)

That the rights of its history do more for a society than the rights of man, that the mere will of the majority is an insufficient basis for government, that France was made by the Capets, that she ought never to have broken with them entirely, that she would even now do well to restore them, the younger branch of them, if the elder is impracticable, that with the monarchy she ought to form again aristocratic institutions, a second chamber, and, to some extent, a hereditary nobility—this is the main thesis of the new part of M. Renan's volume. If this is not done, France, he thinks, cannot hope to vie with Prussia, which owes its victory to its aristocratic organisation and to the virtues of endurance and discipline which this organisation fosters. France's only hope of revenge must then be in the International. The superficial jacobinism, the vulgar republicanism, the materialism (for by all these names and more does M. Renan call it), which the French Revolution introduced, and which has brought France to her present ruin, has fatal attractions for the crowd everywhere ; it has eaten far into the heart and life of England ; it has overrun all the Continent except Prussia and Russia. Prussia too is very probably doomed to enter into this "way of all flesh," to be forced into "the whirl of the witches' sabbath of democracy," and then Prussia's day, too, is over, and France is revenged. At the same time M. Renan suggests certain reforms in French education. These reforms may at any rate, he thinks, go forward, whatever else the future may have in store for us : whether a Capet at Rheims or the International at Potsdam.

All this makes the new part of M. Renan's volume. He has reprinted here, besides, his two letters to Dr. Strauss and several other publications occasioned by the late war ; while the volume ends with an essay on Constitutional Monarchy in France, and another on the respective share of the family and the State in the work of education, which appeared before the war began. These two essays may rank with the best things M. Renan has written, and to read them again heightens our admiration of them. The new part of the book abounds with ingenious and striking thoughts, eloquently expressed ; yet this part will not entirely satisfy the friends of M. Renan, nor does it quite answer, to say the truth, to the impression left on us by the summary of its contents which we read in the *Times* before the book appeared. It has not the usual consummate roundness of M. Renan's composition, the appearance of having been long and thoroughly prepared in the mind, and of now coming forth in perfect ripeness ; there are, or we seem to see, marks here and there of haste, excitement, and chagrin. This was perhaps inevitable.

Our business is not with politics, foreign or domestic ; yet on one or two of the political points where M. Renan does not quite satisfy us, we must touch. We will not ask whether France in general has not let the idea of dynastic attachment, as M. Renan calls it, and the remembrance of its historic self before 1789, so completely die out that it is vain to seek now to restore them, although, when Burke wrote, this might still have been possible. But we will observe that this restoration has, in any case, an enemy more serious and more respectable than that vulgar jacobinism, with no higher aim than to content the envy and the materialistic cravings of the masses, which M. Renan assails with such

scorn; it has against it the republicanism of men, for instance, like M. Quinet. This republicanism is a reasoned and serious faith, and it grows not out of a stupid insensibility to the historic life and institutions of a nation, nor out of a failure to perceive that in the world's progress, as M. Renan eloquently and profoundly urges, all cannot be prosperous, some sacrificed lives there must be; but it grows out of the conviction that in what we call our civilisation this sacrifice is excessive. Our civilisation in the old and famous countries of Europe has truly been, as M. Renan says, in its origin an aristocratic work, the work of a few: its maintenance is the work of a few; "country, honour, duty, are things created and upheld by a small number of men amidst a multitude which, left to itself, lets them fall." Yes, because this multitude are in vice and misery outside them; and surely that they are so is in itself some condemnation of the "aristocratic work." We do not say that the historic life and continuity of a nation are therefore to be violently broken, or its traditional institutions abandoned; but we say that a case has been made out against our mere actual civilisation, and a new work given it to do, which were not so visible when Burke wrote, which would certainly have fixed the regards of Burke now, and which M. Renan too much leaves out of sight.

A mere looker-on may smile to read at p. 153, written before Alsace and Lorraine were ceded and when there was still hope of saving them, that France could not survive their loss, that she is like a building so compact that to pull out one or two large stones makes it tumble down, or like a living being with an organisation so highly centralised that to have an important limb cut off is death; and then to read at p. 58 and other passages, written since peace was made, that the immense resources of France are hardly at all altered or impaired, that she is *à peine entamée*. But of this kind of inconsistency a man of heart and imagination may well be guilty when his country is in question; Burke, assuredly, might have been guilty of it.

Our one serious point of difference with M. Renan, and where we confess he somewhat disappoints us, is in his discussion of the faults of France. The capital fault, the cherished defect of France, is—what does the reader think?—want of faith in science, *le manque de foi à la science*. In the same strain speaks Mme. Sand in the charming *Letters* she has lately published: *Nous voulons penser et agir à la fois*, she says; and therefore we are beaten. Nay our amiability itself puts us at a disadvantage, she adds, in this bad actual world: *Nous ne sommes pas capables de nous préparer à la guerre pendant vingt ans; nous sommes si incapables de haïr!* It is the head, *la tête*, which is so greatly in fault; the heart, the sentiments are right; *le Français*, says M. Renan, *est bon, étourdi*; yes, *étourdi* he may be, *harum-scarum*; but he is *bon*. Burke, whom we have so much quoted, says of Charles II.:

"The person given to us by Monk was a man without any sense of his duty as a prince, without any regard to the dignity of his crown, without any love to his people; dissolute, false, venal, and destitute of any positive good quality whatsoever, except a pleasant temper and the manners of a gentleman."

So far he, too, was *bon*: but his goodness had gaps which, though certainly he was also without the scientific temper, would make us hesitate to say that his chief fault was want of faith in science. Of France we may say the same. It seems to us much more true of England than of France that the national defect is want of faith in science. In France the great defect lies, surely, in a much simpler thing—want of faith in *conduct*. M. Renan's chief concern at the failure of the Reformation in France is for what *the head* lost; for the better schools, the reading, the instruction,

which the Reformation would have brought with it. But M. Michelet put his finger on the real cause for concern, when he said that the Reformation failed in France because a *moral* reformation France would not have. That sense of personal responsibility which is the foundation of all true religion, which possessed Luther, which possessed also the great saints of Catholicism, but which Luther alone managed to convey to the popular mind, earning thereby—little as we owe him for the theological doctrines he imagined to be his great boon to us—a most true title to our regard; *that* was what the Huguenots had, what the mass of the French nation had not and did not care to have, and what they suffer to this day for not having. One of the gifts and graces which M. Renan finds in France is her enmity to pedantry and over-strictness in these matters: and in his letter to Dr. Strauss he says that, although he himself has been sufficiently near holy orders to think himself bound to a regular life, he should be sorry not to see around him a brilliant and dissipated society. No one feels more than we do the harm which the exaggeration of Hebraism has done in England; but this is Hellenism with a vengeance! Considering what the natural propensions of men are, such language appears to us out of place anywhere, and in France simply fatal. Moral conscience, self-control, seriousness, steadfastness, are not the whole of human life certainly, but they are by far the greatest part of it; without them—and this is the very burden of the Hebrew prophets and a fact of experience as old as the world—nations cannot stand. France does not enough see their importance; and the worst of it is that no man can make another see their importance unless he sees it naturally. For these things, just as for the more brilliant things of art and science, there is a bent, a turn. "He showed his ways unto Moses, his works unto the children of Israel,"—to them, and to the heavy Germanic nations whom they have moulded; not, apparently, to the children of Gomer and to Vercingetorix. But this opens a troubled prospect for the children of Gomer.

But perhaps we English, too, shall be as the children of Gomer; for M. Renan has a theory that according to "that great law by which the primitive race of an invaded country always ends by getting the upper hand, England is becoming every day more Celtic and less Germanic;" in the public opinion and policy of England for the last thirty years he sees the *esprit celtique, plus doux, plus sympathique, plus humain*. We imagine our Irish neighbours by no means share his opinion. A more truly Germanic, or, at least, Anglo-Saxon, performance than the abolition of the Irish Church through the power of the Dissenters' antipathy to church-establishments, then telling ourselves in our newspapers we had done it out of a pure love of reason and justice, and then calling solemnly upon the quick-witted Irish, who knew that the Dissenters would have let the Irish Church stand for ever sooner than give a shilling of its funds to the Catholics entitled to them, to believe our claptrap and be properly grateful to us at last, was never witnessed. What we call our Philistinism, to which M. Renan might perhaps apply his favourite epithets of *dur et rogue*, may well bring us into trouble; but hardly, we think, our *doux esprit celtique*.

It seems, indeed, as if, in all that relates to character and conduct strictly so called, M. Renan, whom at other times we follow with so much sympathy, saw things with other eyes than ours. In a parallel between the English Revolution of 1688 and the French Revolution of 1830, he asks himself why the first succeeded and the second failed; and he answers that it cannot have been owing to the difference between William of Orange and Louis-Philippe, because the

second had no faults as a ruler which the first did not show in fully as great a degree. When we read this, we are fairly lost in amazement. Surely the most important point in a ruler is *character*; and William III., whatever were his faults, had a character great and commanding; while Louis-Philippe had, or gave the world the impression of having, a character somewhat (to speak quite frankly) ignoble.

We would fain stop here in our enumeration of matters of difference; for to differ with M. Renan is far less natural to us than to agree with him. But it is impossible not to notice one or two assumptions respecting the French Revolution and the intellectual value of France to the world, because to these assumptions M. Renan, like almost all Frenchmen, seems to challenge the assent of mankind, at least of all mankind except France's *rogue et jaloux* enemy, Prussia. Greece and Judea, he says, have had to pay with the loss of their national existence the honour of having given lessons to all mankind; in like manner—

"France at this moment expiates her Revolution; she will perhaps one day reap its fruits in the grateful memory of emancipated nations."

Just in the same strain writes Mme. Sand, in the *Letters* we have already quoted:

"Even though Germany should appear to conquer us, we shall remain the *peuple initiateur*, which receives a lesson and does not take one."

In prosperity the French are incorrigible, so that a time like the present offers the only opportunity for disabusing them of notions of this kind, so obstructive to improvement; and M. Renan, one would have hoped, was the very man to do it. Greece has given us art and science, Judea has given us the Bible; these are positive achievements. Whoever gives us a just and rational constitution of human society will also confer a great boon on us and effect a great work; but what has the French Revolution accomplished towards this? Nothing. It was an insurrection against the old routine, it furiously destroyed the medieval form of society; this it did, and this was well if anything had come of it; but into what that is new and fruitful has France proceeded to initiate us? A colourless, humdrum, and ill-poised life is a baneful thing, and men would fain change it; but our benefactor and initiator is the poet who brings us a new one, not the drunkard who gets rid of it by breaking the windows and bringing the house about his ears.

There seems to us a like exaggeration in the French estimate of their country's intellectual rank in the world. France is the *plat de sel*, the dish containing the salt without which all the other dishes of the world would be savourless; she is (we will use M. Renan's own words, for a translation might easily do injustice to them)—

"la grande maîtresse de l'investigation savante, l'ingénieuse, vive et prompte initiatrice du monde à toute fine et délicate pensée;"

she alone has—

"une société exquise, charmante et sérieuse à la fois, fine, tolérante, aimable, sachant tout sans avoir rien appris, devinant d'instinct le dernier résultat de toute philosophie."

We wonder if it ever occurs to these masters *du goût et du tact* that in an Englishman, an Italian, a German, this language provokes a smile. No one feels more than we do, and few Englishmen feel enough, the good of that amiability, even if it does not go very deep, of that sympathetic side in the French nature, which makes German and Protestant Alsace cling to defeated France, while, mainly for the want of it, prosperous England cannot attach Ireland. No one feels more than we do, few Englishmen feel enough, the good of that desire for lucidity, even apparent, in thought

and expression, which has made the French language. But, after all, a nation's intellectual place depends upon its having reached the very highest rank in the very highest lines of spiritual endeavour; this is what in the end makes its ideal; this is what fixes its scale of intellectual judgment, and what it counts by in the world. More than twenty years ago we said, lovers of France as we are, and abundant and brilliant as is her work of a lower order than the very highest:

"France, famed in all great arts, in none supreme"—

and this still seems to us to be the true criticism on her. M. Renan opposes living names, for or against which we will say nothing, to the best living names of Germany; but what is one generation? and what, directly we leave our own generation, are any names but the greatest? And where, throughout all her generations, has France a name like Goethe? where, still more, has she names like Sophocles and Plato, Dante and Raphael, Shakespeare and Newton? That is the real question for her, when she is esteeming herself the salt of the earth. Probably the incapacity for seriousness in the highest sense, for what the Greeks called *το σπουδαῖον*, and Virgil calls *virtus verusque labor*, is here too what keeps France back from perfection. For the Greeks and Romans, and a truly Latin race like the Italians, have this seriousness intellectually, as the Hebrews and the Germanic races have it morally; and it may be remarked in passing that this distinction makes the conditions of the future for Latin Italy quite different from those for Celtic France. Only seriousness is constructive; Latin Gaul was a Roman construction, old France was, as M. Renan himself says, a Germanic construction; France has been since 1789 getting rid of all the plan, cramps, and stays of her original builders, and their edifice is in ruins; but is the Celt, by himself, constructive enough to rebuild?

We sincerely believe that France would do well, instead of proclaiming herself the salt of the earth, to ponder these things; and sometimes it is hard to refrain from saying so. M. Renan tempted us; yet we see with regret our space nearly gone. Why could we not have kept to our own generation? and then we might have given ourselves the pleasure of saying how high is M. Renan's place in it. Certainly, we find something of a bathos in his challenge to Germany to produce a living poet to surpass M. Hugo; but in sober seriousness we might challenge Germany, or any other country, to produce a living critic to surpass M. Renan. We have just been reading an American essayist, Mr. Higginson, who says that the United States are to evolve a type of literary talent superior to anything yet seen in the mother country; and this perhaps, when it is ready, will be something to surprise us. But taking things as they now are, where shall we find a living writer who so habitually as M. Renan moves among questions of the deepest interest, presents them so attractively, discusses them with so much feeling, insight, and felicity? Even as to the all-importance of *conduct*, which in his irritation against the "chaste Vandals" who have been overrunning France we have seen him a little disposed just now to underrate, he is far too wise a man not to be perfectly sound at bottom. *Le monde*, we find him saying in 1869, *ne tient debout que par un peu de vertu*. The faults and dangers both of vulgar democracy and of vulgar liberalism there is no one who has seen more clearly or described so well. The vulgar democrat's "happiness of the greatest number" he analyses into what it practically is—a principle *réduisant tout à contenter les volontés matérialistes des foules*, of that "popular mass, growing every day larger, which is destitute of any sort of religious ideal and can recognise no social principle beyond and above the desire of satisfying these materialistic cravings." The *esprit*

*démocratique* of this sort of democracy, *avec sa violence, son ton absolu, sa simplicité décevante d'idées, ses soupçons méticuleux, son ingratitude*, is admirably touched; but touched not less admirably is another very different social type, the cherished ideal of vulgar liberalism, the American type—

*"fondé essentiellement sur la liberté et la propriété, sans privilèges de classes, sans institutions anciennes, sans histoire, sans société aristocratique, sans cour, sans pouvoir brillant, sans universités sérieuses ni fortes institutions scientifiques. Ces sociétés manquent de distinction, de noblesse; elles ne font guère d'œuvres originales en fait d'art et de science"*—

but they can come to be very strong and to produce very good things, and that is enough for our Philistines. What can be better, and in the end more fruitful, than criticism of this force; but what constituency can accept a man guilty of making it? Let M. Renan continue to make it, and let him not fear but that in making it, in bringing thought into the world to oust claptrap, he fulfils a higher duty than by sketching paper constitutions, or by prosecuting electoral campaigns in the Seine-et-Marne. "*The fashion of this world passeth away*," wrote Goethe from Rome in 1787, "and I would fain occupy myself only with the eternal."

MATTHEW ARNOLD.

### LITERARY NOTES.

A new poem by Mr. Robert Browning, of considerable length and importance, will shortly appear. It is in verse, and is modern both in subject and rendering. The relations between the sexes are discussed in a dialogue between husband and wife. She questions, he expounds.

Professor Klaus Groth, of Kiel, has been invited by the Curators of the Taylor Institution to give a course of lectures on German literature at Oxford. Following the precedent of M. Taine, who lectured last year in French, these lectures will be delivered in German. An account of Klaus Groth, and several of his Low-German poems with English translations, may be found in Max Müller's *Chips from a German Workshop*, vol. ii. p. 122-159. See also *Academy*, vol. ii. p. 348.

The *Augsburg Gazette* for February 1, 2, gives an interesting account of the *intérieur* of the venerable Austrian poet Grillparzer, who died on the 20th of January, and was buried four days later with great solemnity and a funeral oration by Heinrich Laube. Grillparzer, we are told, was watched over through life and tended in death by three domestic Graces; their names are Netti, Kathi, and Peppi Fröhlich, and the story of their connection with the poet is simple and very innocent. They were children when Franz Grillparzer got his first government appointment and wrote his first verses; their father was kind to the youth, and he gradually became almost a member of the Fröhlich household; he was generally expected to marry the eldest daughter when she was old enough, but whether it was that he wished to marry all three, or, as some say, that he preferred the second and did not like to disappoint the others, or perhaps that he thought his little idyll would lose its bloom in vulgar matrimony, years went on, and he did not propose. The three Graces gave lessons in music and languages, and the poet was not well able to meet the expenses of a household, but when in course of time Counsellor Fröhlich and his wife died, it seemed to all parties right and natural that Grillparzer should take up his abode with the orphans as their "Zimmerherr." All ideas of marriage were given up, and the middle sister, Kathi, remained his *liebe Braut* to the end; for the last twenty-two years of his life he called her so from habit and without disguise, and she inherits all his literary and other property; but this is a mere formality, for the sisters scarcely have a separate existence. Besides fugitive poems, of which Kathi is supposed to have treasured a considerable number, Grillparzer's unpublished works include essays on dramatic subjects, including the genius of Shakespeare; a

dramatic fragment, *Die Jüdin von Toledo*, which, from what the author said of it to Betty Paoli, is supposed to be of considerable extent. A complete work—*Libussa*—has been in Laube's hands many years, but it was confided to him with the injunction 'not to produce it on the stage unless he felt certain of its success, and he did not feel justified in "risking the tranquillity of the worthy old man, who was indifferent to fresh applause, but could still be annoyed by an unfavourable reception."

We would draw the attention of our musical readers to *The Old Cheque Book of the Chapel Royal from 1561 to 1744*, just edited by E. F. Rimbault for the Camden Society. It contains notices of very many English composers, their admissions, obits, &c. The old Chapel Royal, Whitehall, was burnt 1698, and Dr. Blow composed his anthem, "Lord, remember David," for the opening of the new one. The Chapel Royal, St. James's, was used much later. Henry Purcell lived in a suite of apartments in St. James's Palace, access to which was obtained by a winding staircase in the clock-tower. Dryden, when in debt, used to stay with him for weeks together in these apartments, where he was secure from his creditors. The book contains curious things wherever one dips into it.—The other Camden publication, the *Life of Bishop Bedell*, contains valuable information about the Irish rebellion, but has been already used by Burnet. The supplementary chapters give a good deal of additional matter.

The *Revue des deux Mondes* (February 1) contains an elaborate and not unsympathetic critique of "Le Docteur Strauss," by M. Victor Cherbuliez. He points out that the first *Leben Jesu*, written before Strauss was thirty, includes all that is really original in his contribution to theology, while his temperament was still too exclusively that of a theologian to allow his researches to take a wider range. His biographical works are commended for their literary merits, but treated as one-sided. When theologians begin to write politics, of course they are judged according to the skill they may display in their new rather than their original branch of study. In his *Friedliche Blätter*, Strauss descended to the ordinary newspaper level, and he is followed by his critic, but M. Cherbuliez at least is aware that it is a descent.

The President of the Geographical Society of Italy has written to the papers to say that the Conservator of the Bibliothèque Royale of Belgium has discovered a MS., in twelve chapters, containing the original autograph account of the discovery of Australia by Manuel Godinho, a Portuguese navigator who touched there in 1601, and whose priority to the Dutch sailors, who arrived three or four years later, has been unduly neglected. Mr. Ruelens vouches for the authenticity of the MS., which was brought to light at the Antwerp Exhibition, though it passed unnoticed in the crowd.

In *Fraser*, F. W. Palgrave speaks with authority on the growing force of the Mahomedan religious revival; and Professor Owen feels called on to protest in the name of science against a strange statement which has found its way into *The Speaker's Commentary*, and which reduces itself to the fact that Buffon and Haller were not prepared to risk the consequences of averring that Methuselah could not have lived 969 years. The professor analyses some cases of supposed longevity, and dwells on the nearly invariable proportion between the different phases of the organic existence of allied animals. But he is content to rest the issue on the teeth. A life of eight or nine centuries would wear out several sets of molars, and if Methuselah renewed his teeth like the elephant or the megatherium, he and his contemporaries were "zoologically distinct from the actual species of *Homo*." Stories of persons who have renewed their teeth for a third time in old age are plausibly accounted for by the case, which came under Professor Owen's observation, of an old Irish woman who related the same marvel of herself, where as the fact proved to be that a broken stump over which the gum had closed was beginning to be felt again as the jaw shrank with age.

## Art and Archæology.

## THE EXHIBITION OF PICTURES BY OLD MASTERS.

## I.—ITALIAN SCHOOLS.

ONE of the first things to take note of in regard to this year's Exhibition of Ancient Pictures at the Royal Academy is that the works by Italian masters are far less numerous than before, and, with a few brilliant exceptions, comparatively uninteresting. The managers of the exhibition, seemingly in order to make the greatest show with the least possible trouble, have, it is true, obtained a certain number of Italian pictures from Hampton Court, but they are all well-known works, which have been already times and often described; with one exception, therefore, I shall pass over these specimens.

The removal of national pictures to Burlington House from their accustomed places of deposit, where the public can at any time see them, is surely as superfluous as, on the other hand, the bringing together of treasures of art hidden away in country houses and private galleries is a real and appreciable public service.

The number of such works in this country often slumbering unnoticed for generations together is enormous, and there is no indisposition to lend them for the public benefit. All that is wanted is knowledge and taste to select the right pictures, and to ignore the dubious or bad ones. Of course this is very difficult and troublesome, but in commencing these exhibitions the Royal Academy ought to have been well aware of the arduous and responsible nature of the task. Now that the task has been undertaken, the public, to whom these gatherings are most acceptable, have a perfect right to require not only the mere annual continuance of the exhibitions, but such improvements in their general status as shall render them really worthy of the quasi national institution itself. These remarks are prompted by the fact that the present exhibition displays a marked falling off in the scale and relative importance of the contributions, and also evidence of even less care in regard to the selection, arrangement, and illustration of the specimens than on the two former occasions. No little scandal and dissatisfaction have again been caused by the admission of spurious, doubtful, and inferior works. It ought to be well understood that the Royal Academy alone is to blame for this. Few private collections, it is true, are exempt from such a leaven, but in the interest of the contributors themselves the Academicians ought sternly to refuse such pictures if pressed upon them—they should clearly explain that, whilst both the "prestige" and the pecuniary value of authentic and really fine pictures will be greatly enhanced by their exhibition at Burlington House, spurious and doubtful contributions are just as certain to find their true level, to bring discredit on the judgment and taste of their owners, and, it may be, even to permanently lessen the value of any genuine and really important works with which they may be associated.

Enough has been said in the daily press (and it has been re-echoed in other countries) as to the incorrect and careless catalogues and the absence of any intelligible system of arrangement of these exhibitions. If next year the Royal Academy holds another exhibition of this kind, and these matters are not then radically amended, the serious question, wherefore, and on what grounds, a limited, exclusive, and self-appointed body of practising artists, banded together mainly for the sale of their own works, is entitled to the imposing status of the Royal Academy of Arts of England, will probably be raised by other voices than those of the timid members of their own profession.

The interest of the present gathering as regards the Italian schools centres almost exclusively in two pre-eminent names—Raphael and Titian. The one exquisite work of the former master, and four of the latter in truth alone call for special notice.

The "Little Madonna of the Orleans Gallery" (No. 95), contributed by H.R.H. the Duke d'Aumale, comes first in order.

This well-known and most precious work, executed on panel, about 11 inches high and 8 inches wide, was in all probability painted in the year 1506, when Raphael was in his 23rd year, and there are grounds for believing it to have been executed in his native city of Urbino. The picture is entirely by Raphael's own hand, and, moreover, it is one of the first productions in which

that hand is seen entirely emancipated from the conventional trammels of early association. There is here scarcely any trace of the early Umbrian school or of the specific manner of his master Perugino; it displays in fact an enormous onward stride in art, so remarkable indeed as to have greatly mystified one of the most eminent and industrious of modern art critics—Raphael's special devotee and historian, Passavant. The history of the picture, so far as regards its successive ownership for about two hundred years past, is sufficiently known. Towards the end of the seventeenth century it was in the possession of "Monseigneur," brother of Louis XIV.; at a later period it passed into the famous gallery of the Orleans family at the Palais Royal, during which time it was more than once engraved. When the Orleans collection was brought to London and dispersed in 1798, the picture was bought for 500*l.* by Mr. Hibbert, one of the notable amateurs of that day; it next appears in the hands of Messrs. Nieuwenhuys, the eminent picture dealers of London and Brussels, and shortly after 1835 it was sold by them to M. Benjamin Delessert of Paris for rather less than 1000*l.* The Delessert collection was in turn sold by auction in Paris three or four years ago, when the picture was purchased under the hammer by the Duke d'Aumale for something over 6000*l.* It is of course impossible to say exactly how much further the natural desire of the Duke to secure one of the old treasures of his family would have induced him to extend his biddings at the sale; it is known at all events that his commission was not an unlimited one; but the picture is literally of priceless value, and one thing is certain—that his opponent, the Director of our own National Gallery, should have secured it for this country *coûte que coûte*. At the time in question the National Gallery had ample funds to have purchased the picture up to any reasonable or indeed unreasonable amount. The nation had in fact shortly before acquired a less desirable work of Raphael at a much greater price; there is therefore no excuse for the lamentable want of judgment and energy manifested on this as on so many similar occasions.

I cannot do better than translate Passavant's description of the picture (*Raphael d'Urbino*, vol. i. p. 45, ed. Fr.), especially as it embodies the unlucky error to which I have already alluded. It is as follows:—

"The Virgin, turned to the right, almost in profile, is seated on a stool or form, and holds the Infant Jesus with her left hand, whom she contemplates with loving looks—the Child, raising himself towards her, takes hold of her vestments with his hands in order to aid himself: he is looking out of the picture with a serious expression. The background represents the wall of a chamber, with a reddish grey curtain on the left, and a shelf on which are placed some small vases. *These latter accessories and the reddish grey curtain have certainly been added more recently: they are painted in the manner of David Teniers, so much so indeed as to give every support to the belief that he was actually the author of these unfortunate additions.*"

There is nothing to be said against the first part of the description; it clearly enough illustrates the composition—one of those simple representations of maternal affection so often portrayed with varying circumstances of detail by the great master—but the singular assertion that the accessories were added to the picture by David Teniers should be once for all rectified, and the more so as it has been recently repeated and endorsed in various notices of the present exhibition.

Not only is the picture in every portion entirely by the hand of Raphael, but the original workmanship, if it may be so termed, is so sound, the colours and vehicles used so pure and well applied, whilst at the same time the picture has always been so carefully preserved, that the surface has acquired a homogeneous so-called "patina" as transparent and to outward appearance almost as hard as a vitreous enamel. The painting must have arrived at that state long before the age of David Teniers, and any addition then executed on the surface, even by the most skilful hand, would be immediately visible to the eye of an expert. There is, however, no such appearance. The curtain and accessories are certainly of one and the same piece and texture with the rest.

I have elsewhere rectified similar errors of Passavant in regard to the works of Raphael—carefully and conscientiously, as I trust, and it will not be a waste of time to pursue the present matter further.

Passavant was an artist by profession, and with all his industry and devotion the practice of his profession did not allow him opportunity enough to acquire that wider range of knowledge and culture which are at the present day the character-

istics of the highest grade of connoisseurship. There are thus many indications which of necessity fell dead upon him for lack of adequate collateral study and observation—one of these indications in the present case alone is sufficient in itself to refute his theory. The little vases on the shelf, for instance, are not such vases as David Teniers would ever have painted, for the simple reason that they were of a kind he would never have been likely to see, still less to invent; they are, in fact, Italian majolica ware drug pots, "vasi di spezieria," just such as were manufactured in thousands for all manner of domestic uses in Raphael's own day at the head-quarters of that fabrication, his own native city of Urbino.

The oft-repeated sarcasm of the old Bolognese art-writer Malvasia, who, full of foolish local jealousy, taunted Raphael with being merely a "boccalaro urbinato," i.e. an Urbinese potter painter, might indeed have received some shadow of justification if he had noticed the pots in this particular picture, and could have adduced them in evidence of Raphael's ceramic pursuits. If Passavant, however, had merely confined himself to noting the fact that the execution of these details betrays a marked bias towards the Flemish manner and technique, he would have been quite right; that bias does unquestionably exist, and it is an interesting and instructive peculiarity—but it is seen quite as strongly in every portion of the picture as in the details in question. I admit even that a certain fortuitous resemblance to the style and handling of David Teniers may perhaps be seen in this little work, executed more than a hundred years before he was born; the explanation of all this, however, is very simple; not only in this picture, but in several others still extant, painted by Raphael about the same time, the influence of the early Flemish painters is seen strongly marked and undeniable. For instance, in the exquisitely beautiful Holy Family with a lamb, at Madrid, this *soi-disant* "Teniers manner" is quite as much developed as in the picture now in question. But it may be objected that from the early Flemish painters of the fifteenth century to David Teniers there is a wonderful leap. So there is, but it is a curious fact that of all the great Netherlandish painters of the seventeenth century Teniers was perhaps the one whose crisp transparent execution and brilliant light-some colour most strongly recalls the exquisite works of the Memlings and Roger Van der Weydens, whose technique and pictorial qualities he directly inherited. Unquestionably in these pictures of Raphael there is a sparkling vivacity of colour and a spirited lightness and freedom of touch different from all that had been achieved before by his countrymen.

This fortuitous resemblance to the style of David Teniers, then, is a curious and interesting coincidence brought about by a well ascertained cause, which is this. It is known that the Dukes of Urbino were great admirers of early Flemish art—that they not only procured beautiful pictures by way of Venice from Bruges and Ghent, but that they had, even before Raphael's time, invited Flemish artists to Italy, and employed them at their court. There is indeed a chapter to be written on the influence of the early Flemish painters, and the introduction by them of the newly discovered processes of oil-painting into Central Italy—to all appearance next to Venice, Urbino was the principal centre from which the new art was rapidly propagated in Italy; we have proof positive that Raphael was an ardent student of the new style and processes. It is a fact that there are still extant certain works by an early Flemish painter, executed by order of Duke Federigo of Urbino about the time of Raphael's birth. These are certain large panel-pictures, heads or busts of ancient classical and mediæval philosophers and men of letters; an entire series of these panels was in fact executed expressly to decorate the walls of the library in the palace at Urbino. Several of them were preserved in the Campana Collection, and are now in the Louvre. Now these panels were doubtless daily under Raphael's eyes when a youth, and a curious proof that they were so is the fact that one of his sketch-books, made when he was about eighteen or nineteen years old, and now preserved in the Academy at Venice, contains a most careful and beautiful series of drawings made from these very panels. It is all but certain that these works were executed by one Justus of Ghent, a scholar of Van Eyck, who resided at the court of Urbino. They are completely in the style of the latter great Flemish artist, and show no evidence of the slightest acquaintance with contemporary Italian art. There is nevertheless little doubt that they were actually executed in Urbino.

But this is not all—there also still exists at Urbino, in the sacristy of the cathedral, a large picture known to have been painted by the same Justus of Ghent, when he had become almost a naturalised Italian; and it, as might be expected, *does* show the influence of the art of the painter's adopted country—the latter work is in fact a hybrid production of the most curious kind, half Flemish, half Italian, in style—an oil picture drawn with much of the stiffness and archaism of the old Umbrian school, yet entirely Flemish in execution; the luminous depth and power of the old Flemish colouring and light and shade nevertheless being in great measure replaced by the clear light-some fresco-like colour of the early Italians. Here then we have the very converse of the influence exerted on Raphael at a subsequent period.

The truth really is that Raphael, like all the greatest artists, was an ardent innovator—his art never stood still. He not only had the power of assimilating all previous and contemporary excellence, but even of anticipating in some degree developments which would necessarily result in after ages from the pregnant germs sown in his own time by others.

It is a fitting transition from the greatest masters of design to the paramount colourist of the modern art cycle. The four works of Titian now before us are all deserving of the closest study, and much more might be said about them than I shall have time or space to indite at present.

The life of Titian completely overlapped, as it were, that of Raphael. Titian was born six years earlier, and outlived Raphael no less than fifty-six years (1483–1520 and 1477–1576). Raphael was cut off in the full maturity of his powers; whilst Titian may be said to have outlived himself. As might be expected, Titian's style, necessarily tinged and influenced by the surrounding associations of passing epochs, varied very greatly during the long period of his artistic activity. Thus his early works, contemporaneous with those of Bellini and Giorgione, those of his middle time, and again those of the later period of his life, when he stood alone amidst a generation of painters to whom the early associates and rivals of the man had become, as it were, "ancient masters," have really but little in common. Were it not indeed for certain glorious veins, which run through all the epochs alike—a pure "Titianesque" alloy giving the same splendid lustre to very different metal—the productions of the several periods might well be taken as the works of altogether different men.

The earliest in date amongst the present pictures is the portrait (said to be) of Alexander de' Medici, from Hampton Court (No. 72). This belongs to the first half of Titian's art career, but not, strictly speaking, to his early period. The "replica" of "La Gloria" (No. 114) and the "Europa" (No. 126), both painted about the same time, are of his later but still vigorous period, whilst the "Diana and Actæon" (No. 73) is decidedly a senile work of the painter.

If the Hampton Court portrait were in its pristine state, or were it even tolerably well preserved, no finer specimen of Titian's powers as a portrait painter at his best time could perhaps have been shown; but, alas! the hand of the spoiler has been heavy on this treasure—not that of the inevitable spoiler—time—but the still heavier hand of stolid ignorance! and it must needs be said that the greatest blow has been inflicted quite recently by hands probably still busy at this ruthless work!

This magnificent picture has been always well known as one of the chief treasures of our royal collections. It belonged to Charles I., and was admirably engraved during his time by the able Flemish engraver Van Dalen. Though the personage represented greatly resembles Duke Alexander de' Medici, and although the costume and evident date of the picture (circa 1520–30) are in agreement with the attribution, there are reasons which it would be too long to recite why it can scarcely be the portrait of that personage.

I shall not describe this picture in detail—this has been done before, and it is at all times visible to the public—but I shall pass at once to the consideration of its present state and condition. This picture unfortunately, within the last five or six years, has been what is called "restored"—in reality, *greatly and irreparably injured*! As it happens, some years before this occurrence, it was for a lengthened period officially deposited in my keeping, and for months together it was daily and hourly before my eyes. During that time I repeatedly examined the

picture in the best possible light, and I am therefore in a condition to speak positively as to the transformation which it has recently undergone. It may as well be remarked that most of the pictures contributed to the present exhibition from Hampton Court are amongst those which have been "restored" under the present administration of the Gallery. If the object of exhibiting them at Burlington House was to challenge public opinion in regard to the cleaning and "restoring" operations which have been systematically carried on for a series of years, I cannot but say that I think that the course was a very unwise one, and that it would have been more prudent to have left the flayed and fresh-bedizened specimens in the quiet obscurity of the sombre apartments of the old palace.

Fortunately I am not alone in my reprobation of the cruel injury which has been inflicted on the picture now particularly in question, for an ably written letter appeared in the *Times* two or three years ago, pointing out the very facts to which I have now in turn to solicit attention.

The picture had doubtless in former years been greatly neglected and misused. There had been a large hole made through the canvas in the centre of the forehead of the figure, and which had been coarsely repaired and daubed over, seemingly by a common house painter perhaps more than a century ago. The picture was heavy and black in aspect mainly from the load of dirty varnish coarsely piled upon it in repeated coats from time to time. Nevertheless, through all this, the original lustre and perfection of Titian shone like the sun through murky clouds, and in spite of every drawback the picture was evidently fairly well preserved.

The head was relieved against a dark background evidently meant to represent empty space, *i.e.* that colourless atmosphere or medium, deep-toned, transparent, and impalpable, which Titian knew better than any other painter how to depict; but this dark background was not devoid of variety: it was, in fact, wonderfully toned and graduated so as to carry out and enhance the entire scheme of light and shade of the portrait. Titian's method of executing backgrounds such as this was by painting at first in solid impasted colours; the required depth, transparency, and variety of tint being afterwards gradually obtained by repeated glazing and scumbling with thin diluted pigments. Now this modern so-called "restorer," when he took the picture in hand, proceeded to effect what in the jargon of his profession is called "stripping" it, that is, he removed all the successive coats of varnish and the retouches which may have been applied at various periods, but he also in his carelessness and ignorance "stripped" off more or less completely along with these extraneous additions the superficial glazings, &c. which Titian himself had superimposed! The disastrous results can be more easily imagined than described—space will only allow me to specify one glaring evidence of the "stripping" process. The background of the picture, for instance, was entirely changed; the colourless transparent medium in which the head was, as it were, enveloped, and from which it emerged with amazing force and reality of effect, was replaced at once by a flat, hard, bluish-grey, empty surface, heavy and meaningless, signifying nothing but mere formless, textureless paint! So completely in fact has this picture been transformed that the background, which *was dark, is now light*, and the head is now detached in hard violent contrast, *dark upon light*, instead of *light upon dark*!

The unintelligent polluting touch of the "restorer" is visible more or less all over this once noble picture; finally the coarse repainting of the forehead of the figure, which a really skilful operator might easily have removed, is left just as it was, and is now indeed even rendered more obtrusively visible by the scouring process to which the rest of the surface has been subjected.

I purpose to notice the three remaining pictures of Titian in the next number of the *Academy*, and afterwards to give some jottings and memoranda on some of the principal Spanish, Flemish, and Dutch pictures in the exhibition.

J. C. ROBINSON.

#### EXHIBITION OF PICTURES IN WATER COLOURS, DUDLEY GALLERY, EGYPTIAN HALL.

THIS exhibition, which has for some years been distinguished by a general character of excellence, does not appear to us to

demand an extended notice this season. At first there were a number of rising men or painters who had not hitherto been seen in water colours; and these were joined by others who occasionally paint in that medium, whose oil pictures were well known. Besides, there have always appeared on the walls of the Dudley a great number of small landscapes distinguished by original observation and admirable sentiment. It is not necessary to mention names, representative of either of these categories, at least to those who have been interested in the exhibition. Gradually, however, the established painters have loosened their connection with the Gallery, or are now otherwise engaged; and the landscape element has this season taken a larger size and an inferior quality, some of the best artists of a year or two ago being insignificantly represented, or not at all. New exhibitors present themselves, but the committee of management treat them rather arbitrarily. Burne Jones, it is true, has been placed in the best position; and on hearing that he was an exhibitor, we went with the full intention of devoting ourselves to the study and elucidation of his works there expected. But, unhappily, the four emblematic figures in one frame, painted in tempera with some glutinous medium on cloth, called "The Triumph of Fortune, Fame, Oblivion, and Love," are too obviously imitative of old Italian work (the drawing that of Signorelli), both in manner and spirit, to be considered worthy of his transcendent powers. The only exhibitors of the original set fully represented are Simeon Solomon, whose several works here are all noteworthy, and informed with lovely and tender sentiment; and J. E. Poynter, who only sends two small portraits, painted with infinite care and refinement. But after the imaginative or historical pictures we have seen of these painters, it does not appear necessary to dwell on the present examples. A. B. Donaldson is here in great force, but also in a reproductive spirit, giving us a recollection of certain Venetian colourists; C. N. Hemy, also, imitating the modern imitations of earlier Flemish art.

It would seem as if all that now is left for the modern artist, in respect to the technique of his art, is to endeavour to do again what has been done before by the great masters. But he must use his art in obedience to other motives. Some pictures of modern times indicate this: one or two in France, "The Wreck of the Medusa," though a painful subject, perhaps De la Roche's "Hémicycle," in the *École des Beaux-Arts*; some in Munich, barring the colour; and in this country lovely inventions, answering "the desires of the heart," by D. G. Rossetti and E. Burne Jones, though both suffer from defective training. But such merely imitative work as these four emblems, by the latter, are nothing to the purpose. W. B. SCOTT.

#### ART NOTES.

The administration of the city of Paris sees itself forced to reduce considerably the sums annually voted for fine art purposes. It will, however, continue the publication of the volumes containing documents relative to the history of the town. The *Hôtel Carnavalet* is destined to receive the new library and museum of the city.

The Vienna Museum for Art and Industry is now completed. For the moment the rooms are occupied by an exhibition of specimens of modern Austrian work, but as soon as this exhibition closes, the collections which have been provisionally housed in the old Ball-house, will be transferred to their permanent home. An intelligible description of the building, accompanied by excellent plans, will be found in the *Zeitschrift für bildende Kunst* for Jan. 12.

The Albert Memorial in Hyde Park will soon be completed. Two of the corner groups are already up, and the remaining two are in course of erection. The "Asia," by Mr. Foley, promises well, the single figure yet in place is full of fine character and dignity. In about a fortnight, the freize round the base of the Memorial itself will be uncovered, and can then be appreciated with greater justice; for at present the shed which encloses it shuts out the daylight for which the work is calculated. The portions by Mr. Armistead, "Music and Painting," are remark-

able for sound thought and work. The treatment is skilful and picturesque; some of the figures show fine lines, and the impression, as a whole, is complete. One point will be likely to challenge criticism. Mr. Armistead has boldly attempted the feat of turning the back of one of the figures to the spectator. This seems a little doubtful. Figures may appear to come forth to the air, from the solid block, but the moment we reverse the process, knowledge of the impassable wall checks the imagination, the actual limit of space is felt, and in consequence, we seem to see half a man balancing on a ledge. But light and shade do so much magic, that perhaps the removal of the shed may help this figure by throwing it into strong relief. Details in the work of the canopy deserve attention. Many portions, both in bronze and mosaic, are attractive and artistic in conception. If, however, we turn from considering separate portions to take a view of the whole, we feel that we cannot yet congratulate ourselves on having escaped the fates which attend on all our public works. Two radical defects seem in part to cause the whole shortcoming. First, the unsuitability of the base to the memorial itself. The base, the steep ascending flight of steps, is too considerable for the slight thing which surmounts the whole. Second, the site does not harmonize with the character of the monument. The lines of the canopy seem imperatively to demand an architectural background. As it is, the Memorial does not look as if it belonged to its place. Is it possible, that did it stand in a marble-paved court, on a comparatively low platform, ascended by broad and shallow steps, closed in by narrowing walls, against which every line would be boldly accentuated, rising into light from the deep cast shadows of its surroundings, is it possible that so, we might have looked on it with pleasure?

The chief feature of the *Gazette des Beaux-Arts* for February, is a reproduction of a fine pen-and-ink sketch ascribed to Mantegna, and existing in the collection of M. Emile Galichon. The subject is "Tritons restraining sea-horses," and the drawing is supposed to have been a portion of a composition representing a triumphal procession of Neptune. The letter-press does not give a scientific account of the drawing, but it seems once to have been in Ottley's hands. M. Lecoy de la Marche has resumed the publication of the correspondence of directors of the French Academy at Rome. Some letters of Natoire, printed in the present number, are an interesting contribution to the art history of the eighteenth century. The publication of the documents relative to the arts during the Commune is also continued by M. Alfred Darcel.

The "Madonna with the Veil" by Titian was generally believed to have perished in the sack of Rome by the Constable of Bourbon. It is now reported to have been discovered amongst the pictures in an old chateau belonging to the late Dr. Riteri. The professors of the Academy of Turin pronounce it to be the genuine picture.

Lady Walmsley, of Hume Towers, Bournemouth, is about to present to the nation the portrait gallery belonging to the late Sir Joshua Walmsley. The collection comprises a portrait of Cromwell by Lucy, portraits of Nelson, Garibaldi, George Stephenson, Hume, Cobden, Bright, Disraeli, and Gladstone.

The dangers run by the glass-paintings of the Paris churches during the two sieges suggested to the Municipal Council the idea of making a complete collection of the cartoons originally employed in their execution. When the original designs cannot be procured, careful tracings are to be made on the glass itself. M. Prosper Lafaye, the author of the remarkable restorations of Saint-Séverin, is the artist entrusted with the realization of the project.

A quantity of Palissy ware is reported to have been discovered on the estate of the Count de la Grandpré, in the neighbourhood of Apremont. Two peasants whilst ploughing laid bare the mouth of a cave about fifty centimetres below the surface; the count arrived on the spot, and directed excavations to be made, the result of which was that in an obscure corner a quantity of

*vieilles poteries émaillées* were found. The work of excavation is to be continued.

At the instance of M. Gallait, the Belgian Academy of Fine Arts proposed to the government the erection of a building specially devoted to artistic exhibitions. The request has been complied with, and a hall is to be built on some waste lands near the Rue de la Régence, which is to serve at the same time the interests of painting, sculpture, and music.

The collections of the late M. de Villestreux will be sold in two parts. His faïence, porcelain, glass, and tapestry, will come to the hammer at the Hôtel Drouot, but his pictures, as well as the paintings of the fourteenth, fifteenth, and sixteenth centuries, and *objets d'art*, from the collection of the Count de Nahuys, will be put up to auction next week at Brussels.

The catalogue for the sale of the collection of M. Michel de Tretaigne is just out. It is illustrated with nineteen fine etchings. The price is ten francs.

Anton Hess has just completed the four colossal figures commissioned for the Rathhaus of Munich. They personify *Gewerbfleiss*, *Häuslichkeit*, *Bürgermuth*, and *Wohlthätigkeit*. The building of the Rathhaus itself is nearly finished, and the figures will be immediately placed in their distinct niches.

The *Nürnberger Korrespondenz* gives a short biography of Dr. Heinrich Schliemann, whose touching enthusiasm for a particular theory of Trojan topography takes the practical form of excavations, which we have noticed from time to time. He was the son of a small shopkeeper, went to sea, was wrecked, and took a clerkship in an Amsterdam house of business. Half his salary (800 francs) was spent in learning languages, which he mastered at the rate of six weeks a piece. In 1846 he went to Russia, and gradually grew rich; and in 1856 allowed himself the pleasure of learning Greek (ancient and modern) in three months: he had been afraid before, lest the interest of the pursuit should be so absorbing as to interfere with his business engagements, from which he withdrew in 1863 to spend a well-earned fortune in travel and the indulgence of his archæological tastes.

In the *Allgemeine Zeitung* (January 30) Dr. Lübke notices some recent publications of the Austrian Museum of Art and Industry, and contrasts the neglect of all art-interests displayed by Prussia, and especially in Berlin, ever since the death of Kugler in 1857. His complaints receive additional point from the fact that the new gold coinage of the empire has been so badly struck that it will have to be called in.

Competent connoisseurs consider the supposed Jamnitzer cup, recently acquired for the South Kensington Museum, to be of doubtful genuineness.

The *Uhland-Denkmal* is now somewhat advanced. The statue modelled by Kiez of Dresden has been cast by Pelargus at Stuttgart, and is already half finished as to the chiselling. But in consequence of Kiez being behindhand with a portion of the relief, there is no chance of the statue being in position before the end of this year. The architectonic part of the work will be carried out by Nicolai of Dresden and Koch of Tübingen.

Madame Moscheles, the widow of the eminent composer, is at present engaged in writing the life of her husband. The work is to appear, if possible, simultaneously in English and German.

The large number of various classes of drawings representing the practice of William Hunt, both in his early and later time, collected by his friend and medical adviser, Mr. Wade, of 68, Dean Street, have been and are now visible by admission cards (from 12th to 17th current.) previous to dispersion. The collection is unique—as it is not likely any other either so extensive or so good exists—and is certainly very interesting, as showing the

water-colour art of the last generation from the hand of one of its greatest proficient.

Mr. Wood, to whom we alluded briefly in our last number (p. 46), has obtained authority from the Sultan to make extensive excavations at Ephesus, in order to bring fully to view the remains of the famous temple of Diana, burnt by Erostratus. The site has been discovered already, the pavement of the *cella* has been laid bare, together with several magnificent architectural fragments.

In the *Beilage* of the *Allgemeine Zeitung* for January 9, Dr. Alfred Woltmann gives an account of the rearrangement, &c. of the gallery of paintings at Carlsruhe. This gallery contains many works of value, many old German pictures, some Italian, a large collection of eighteenth-century French, amongst which are some valuable Chardin, and a good deal of modern German painting. All this was in the most miserable state of neglect and confusion; now order and reform have passed everywhere except into the catalogue, which corresponded in ignorant carelessness with the previous state of the pictures. Dr. Woltmann mentions, by way of example, that a Madonna of La Hire is ascribed to Poussin, who, it is stated, was born 1505—died 1565. Thus a painting of a century later than Poussin is first given to him, and then the period of his activity is *antedated* by a century.

The regulations for the coming Salon have been much debated in Paris. A sentiment has been gaining ground amongst artists in favour of establishing complete independence of the government. The present programme, founded on the report addressed by M. Charles Blanc, the Director des Beaux-Arts, to the Minister of Public Instruction must be considered only as a temporary compromise. Though for the moment no practical result has been achieved, the day is not far distant when juries, medals, &c.—all, in short, that does or is supposed to symbolize protection in art—will be swept away. M. Louvrier de Lajolais remarks in the *Chronique des Arts* for December 24, 1871: "La seule protection que l'État doive aux artistes, c'est celle à l'aide de laquelle ces derniers parviendront à se constituer indépendants de lui."

M. Jules Labarte, who is well known by his works on the arts of the middle ages and the renaissance, has just been named *membre libre* of the Académie des Inscriptions et Belles-Lettres.

### Physical Science and Philosophy.

Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Art, and Custom. By Edward B. Tylor, author of Researches into the Early History of Mankind, &c. 2 vols. Murray, 1871.

It is perhaps inevitable that in the present chaotic state of our knowledge of man's mental nature and its relation to his visible organism, a work like the present should be unsatisfactory. The minute anatomy of the brain has been long ago exhaustively investigated, while the comparative study of its form and size in different races and individuals has been carried on by means of extensive collections of crania and casts; yet, although the brain is almost universally admitted to be the organ of the mind, by neither of these lines of research nor by any combination of them, have any definite conclusions been arrived at as to the relation of the brain to the various mental faculties. Up to the present day our physiologists dispute as to whether the forehead or the occiput is the seat of the intellect, yet they scout the idea of giving up their hitherto barren line of investigation, in favour of that experimental method of comparing function with development which, the much-abused phrenologists maintain, leads to complete success. Equally unsatisfactory is the practice of leaving out of view, in theories of mental development, the numerous well-established cases of abnormal mental phenomena which indicate latent powers in man beyond those usually recognised. These are looked upon as obscure diseases of the nervous system, and although their occurrence is very rare to individual experience, the records of them are now sufficiently voluminous to furnish comparable cases to almost all that occur. They can thus be grouped into classes, and this fact, of each one forming an item in a group of analogous cases, is supposed to preclude the necessity of any attempt at a rational explanation of them. This is the method very largely adopted by Mr. Tylor, who in treating of the beliefs, customs, or superstitions of mankind, seems often to be quite satisfied that he has done all that is required when he has shown that a similar or identical belief or custom exists elsewhere.

In these volumes he has presented us with an enormous mass of facts of a very miscellaneous character, and he apologizes for this by the necessity of establishing a firm foundation for so important and novel an enquiry as that which he has undertaken. But the point and bearing of a large number of these facts is not always clear, and his book would have been both more readable and more instructive if typical facts only had been given, and if the propositions sought to be established had been laid down with more precision. In noticing a work so full of detail, it is only possible here to allude to a few of the more striking and characteristic features, as, owing to the author's somewhat involved and prolix style, no extracts of reasonable length could give any idea of the way in which the various branches of the subject are treated.

One of the most important results of Mr. Tylor's researches, and that which is most clearly brought out in every part of his work, is, that for the purpose of investigating the development of man's mental nature race may be left out of the question, and all mankind treated as essentially one. If we accept this as the result of a long and, as far as this particular question is concerned, almost exhaustive study, it forms a powerful argument against the polygenetic school of anthropology; for had the several races of man been derived from several distinct animal forms, or in any other independent way, it is hardly possible to conceive that no fundamental differences whatever should be exhibited in the nature and quality of their mental faculties. Another important question treated very fully is that of development and progress, which are held to be fully established, degeneration being rare and exceptional; and the passage in Sir Charles Lyell's *Antiquity of Man*, in which he sarcastically maintains that if man has degenerated we ought to find, instead of rude implements of flint and bone, lines of buried railroads and electric telegraphs, with astronomical instruments and microscopes better than any we possess, is quoted with approval. But surely this passage is illogical; for man might slowly degenerate in mind while still progressing in arts, and even in science, because these are necessarily growths, and the adapter and improver may have less genius than the inventor who went before him. Mr. Galton has carefully discussed one phase of this question in his *Hereditary Genius*, and gives good reasons for believing that the average Greek of antiquity was higher mentally than the average European of to-day; and the fact that the Greeks had neither microscopes nor even the printing machine has really no bearing whatever on the question. The conception that the human race, as a whole, was higher morally and intellectually ten thousand years ago than it is now, is not disproved by evidence of any amount of inferiority in the arts, which of course is overwhelming. Yet even on this point the facts and arguments of Professor Piazzi Smyth should have been noticed; for he shows that what is admitted to be one of the most ancient buildings on the earth is so perfect both in design and execution, as to demonstrate that its constructors must not only have equalled our modern engineers in mental capacity, but must have possessed instruments capable of determining angles, levels, and distances, with as much precision as any we now possess.

Children's games, nursery poems, proverbs and riddles, are all adduced to show the close mental resemblance between remote ages and widely separated races; but the illustrations of this principle are sometimes far-fetched and improbable, as when the saying, that a frightened person was "ready to jump out of his skin" is connected with the belief in were-wolves—men who had the power for a time of getting out of their own skin to become wolves.

Mythology and nature-myths are next treated at great length, but with little novelty or useful result. The chapters on language are however very good. They treat especially of radical and universal similarities; so that even here Mr. Tylor is enabled to ignore race and all special linguistic affinities, and to show that there is a substratum common to all human language. The words or sounds expressing affirmative and negative, dislike, silence, near and far, and many others, are shown to resemble each other all over the world, and to be founded on interjectional sounds which express similar ideas to all mankind. The mode of counting among various nations furnishes similar fundamental resemblances. These subjects are very fully treated, and afford a solid foundation for the developmental theory of the origin of language.

More than half the work is occupied with the subject of

"Animism" or the doctrine of souls. We are overwhelmed with elaborate details of the endlessly varied ideas and beliefs of men as to the soul, spirits, and gods. We are constantly told that each such belief or idea "finds its place," with the implication that it is thus sufficiently accounted for. But this capacity of being classified necessarily arises from the immense variety of such beliefs and from the fact that they are founded on natural phenomena common to all races, while the faculties by which these phenomena are interpreted are essentially the same in every case. Any great mass of facts or phenomena whatever can be classified, but the classification does not necessarily add anything to our knowledge of the causes which produced the facts or phenomena. We find at times great looseness of statement when Mr. Tylor attempts to account off-hand for superstitions. He tells us, for example, that when the devil with horns and hoofs and a tail had once become a fixed image in the popular mind, "of course men saw him in this conventional shape." Now this general statement is simply not true. In the records of witchcraft-trials it will be found that witches generally described the devil as "a man"—"a dark man"—"a black man"—"a gentleman in black clothes"—"a gentleman richly dressed," and seldom, if ever, as appearing in the full conventional form. The theory of expectant attention determining the form taken by a delusion does not cover these facts, and this is even more strikingly shown by another discordance of a similar nature. It is certainly a popular belief that the devil is hot, and that his touch burns. Yet the witches, whether in Scotland, England, or France, almost invariably describe him as cold to the touch; and this statement, so often made by persons who could have had no knowledge of what others had said, curiously agrees with the phenomenon described by modern spiritualists, of a cold wind passing over the hands during a *séance*. Such a correspondence of testimony in a direction exactly opposed to popular belief points to some substratum of unrecognised facts even in witchcraft, and it is not satisfactory to find the nature of this testimony misstated to make it fit in with a foregone conclusion. A recognition of the now well-established phenomena of mesmerism would have enabled Mr. Tylor to give a far more rational explanation of were-wolves and analogous beliefs than that which he offers us. Were-wolves were probably men who had exceptional power of acting upon certain sensitive individuals, and could make them, when so acted upon, believe they saw what the mesmeriser pleased; and who used this power for bad purposes. This will explain most of the alleged facts without resorting to the short and easy method of rejecting them as the results of mere morbid imagination and gross credulity. Again, we are told that "the ghost or phantasm seen by the dreamer or visionary is like a shadow, and thus the familiar term of the *shade* comes in to express the soul." But the dreamer sees what appear real substantial bodies, not shadows or images; and it is only the waking seer who, by seeing other objects through the phantasms or by testing their unsubstantiality by means of touch, can arrive at the conclusion that they are of a spiritual or shadowy nature. So, the general belief in the ghost of a man being seen in or near the house where he lived, is not at all accounted for by dreams, which are bound by no limits of locality, and generally show persons in the most incongruous places. Accounts of the other world seen in visions are said to be "just what the seer has been taught to expect"; but at p. 47, vol. ii. the seer is *surprised* to find the trees, shrubs, and paths such as she had been used to on earth. It was not therefore what she had been "taught to expect"; and the remark becomes both valueless and misleading, instead of helping us to understand how such visions originate.

Although the details given on these subjects are so numerous and so heterogeneous as to be wearisome in the last degree, they are yet altogether one-sided. They have been amassed with one object and selected, no doubt unconsciously, so as to harmonize with the *a priori* convictions of the writer. All narratives tending to prove that anything which goes under the general term supernatural really exists as fact, are either entirely omitted or just mentioned in such a manner as to imply that they are necessarily impostures or delusions, and therefore unworthy of discussion. There is, however, on record a mass of facts or alleged facts ranging through every period of history down to the present day, and going to prove that the so-called supernatural is not all delusion, and that many of the beliefs of all ages classed as superstitions, have at least a substratum of reality. In the works of Dr. Kerner, Ennemoser, Görres, and Dale Owen, and in Mr. Howitt's *History of the Supernatural*, are collections of these facts which, although by no means exhaustive, are yet far more extensive than those Mr. Tylor has cited to support his argument; while many of them are so thoroughly well established that they cannot be explained away. It is therefore at least a possible solution of the problem of animism, that the uniformity of *belief* is due in great part to the uniformity of the underlying *facts*; and a work on the development of religion and mythology should fairly grapple with the question, "How much of truth is at the bottom of the so-called superstitious beliefs of mankind?" But our author avoids all such inconvenient enquiries by means of his infallible nostrum. A fact or a belief occurring once only might require explanation, but if a second or an analogous fact or belief can be found elsewhere, the whole thing becomes clear. "Second sight," for instance, occurs among savages as well as in Scotland. Nothing more is required, according to Mr. Tylor, to prove that it has no existence at all, except as a mere "belief." Those curious phenomena which have been recently investigated by Mr. Crookes and other Fellows of the Royal Society, and which are declared to be realities by members of the French Institute, by American judges and senators, and by many medical and scientific men in this country, are treated in exactly the same way. Something closely related to them is recorded by classical writers, and occurs now among savage tribes. It is therefore clearly a case of "survival of old beliefs," and no further notice need be taken of it. Mr. Tylor even goes so far as to say that for his purpose it really matters little whether they are true or not. In order to arrive at true results as to the origin, nature, and development of men's beliefs, it matters not whether their foundation is fact or imagination! This belief of Mr. Tylor seems to the present writer as completely an hallucination as any to be found recorded in his volumes.

It is pertinent to recall the fact that even matters of pure science, when they have run strongly counter to popular opinion, have been treated just as Mr. Tylor treats superstitions. Less than twenty years ago the evidence for the antiquity of man was in this category. It was then ignored or sneered at as beneath discussion. It was treated just as if it were an "epidemic delusion;" yet every iota of it turned out to be fact, and fact of the highest importance and of surpassing scientific and human interest. This was a purely scientific question, but there is another which had all the aspect and characteristics of a superstitious delusion, and was yet a truth. About twenty-eight years ago the phenomena of insensibility to pain in the mesmeric trance attracted attention. Experiments of this kind were often exhibited in public, and most painful surgical operations were performed on subjects who manifested no indications of feeling. The present writer well remembers the

universal shout of indignation at these experiments. They were declared to be gross imposture or delusion from beginning to end. The apparent unconsciousness was all sham, and the medical men who performed the operations, and gave a detailed account of them, were accused of being parties to the imposture, and even of having bribed the patients. It took many years to establish this fact, of insensibility to the most excessive stimuli and the most intense pain produced without the use of any drug or any violence; but it was established. It remains, however, a fact of which modern science can give no intelligible account, and which it therefore ignores as much as possible.

These examples (and many others might be adduced) should teach us, that it is unsafe to deny facts which have been vouched for by men of reputation after careful enquiry, merely because they are opposed to our prepossessions. A work like the present, one-sided though it be, furnishes much evidence to support the views of those who maintain that a considerable portion of the so-called superstitions of mankind repose upon facts; that these facts have been almost always misunderstood and misinterpreted in past ages, as they are now by the ignorant and among savages; and that, until they are recognised as possible realities, and studied with thoroughness and devotion and a complete freedom from foregone conclusions, it is hopeless to expect a sound philosophy of religion or any true insight into the mysterious depths of our spiritual nature.

ALFRED R. WALLACE.

#### ARCTIC EXPLORATION.

LIEUTENANT WEYPRECHT'S report of the Austrian Polar Expedition of last year was read before the Academy of Sciences at Vienna on the 7th of December last.

After showing how the ocean streams in the Arctic basin must maintain a delicate balance between the amount of ice produced and the quantity carried out southward to be restored again to a liquid state, so that a certain definite average is never exceeded; and how the outgoing cold current of necessity requires a complementary equatorial flow, the author proceeded to examine this circulation, aided by observations made during the voyage.

Lieutenant Weyprecht claims for the depth-temperatures recorded by this expedition that they are the first trustworthy observations made in these regions, and that they throw new light on the final track of the Gulf Stream.

The entire sea between North Cape, Bear Island, and Novaia Zemlia, was found to contain comparatively warm water, which moved to northward as summer advanced, giving up its warmth by contact with the ice, and carrying the ice edge before it. The depth-temperatures show that the warmer water formed a strongly marked upper stratum, which decreased in temperature and thickness as it was traced to north-eastward. In the meridian of 44° E. in 72° N. the surface temperature was 40°·5 F., and in 77° N. in the same longitude it had fallen to 36° F.; at the former point the temperature of 32° was reached at a depth of 420 feet, at the latter in 65 feet. Everywhere at a depth of 800 feet an almost uniform temperature of 29°·5 was found.\*

In 60° E., near the north coast of Novaia Zemlia, the warmer stratum was found by the expedition to have decreased in thickness to 30 feet, so that its limit had nearly been reached. Judging from this, Lieutenant Weyprecht raises the question whether the open water, with a surface temperature of 44°, navigated last year beyond Novaia Zemlia to 81° E. by Captain Mack, can be due to the influence of this warm stratum alone. In explanation of it he advances the theory that the great Siberian rivers, flowing in part through steppe-lands which in summer have an almost tropical climate, pour such a quantity of fresh and warmed water into the shallow Siberian sea as to account for its observed freedom from ice. One of the smaller streams in the Taimyr peninsula was found by Middendorf to have an average temperature in August of 52°.

\* Former observations with unprotected thermometers in these regions appeared to show an increase of temperature from the surface downwards.

Some light is thrown upon the further progress of this warmer water by the presence in July at the highest latitudes reached by the expedition of great quantities of drift pine-wood, which must have come from the Siberian rivers, and by the appearance in August of a large quantity of fresh-water ice to the south of Gillis Land. Lieutenant Weyprecht believes that a portion of the warmer water from these rivers unites with the furthest branches of the Gulf Stream to cause the open water so unexpectedly found last year between Novaia Zemlia and Spitzbergen, and that the great distances which these sources of heat have to traverse before reaching this area explains the fact of its being free of ice at such a late period of the year as September.

The whole of these observations, Lieutenant Weyprecht considers, clearly indicate the importance of the seas north and east of Novaia Zemlia for the object of Polar research, and he strongly recommends two lines of exploration: one, to northward from the highest latitudes, between  $40^{\circ}$  and  $50^{\circ}$  E., reached in the trial voyage, where, during three months' cruising, no ice which could be termed "pack" was seen; the other, to eastward through the unknown waters to the north of Siberia, making for Behring Strait and an American harbour.

### Scientific Notes.

#### Geography.

**Geographical Distribution of Coniferae.**—Dr. Robert Brown has communicated to *Petermann's Mittheilungen* an important paper on the geographical distribution of Coniferae and Gnetaceae. Separating the regions which contain a number of species, the greater part of which are peculiar to these areas, he distinguishes twenty-six "provinces" of distribution over the globe. Each of these, with its characteristic species, is described in detail in the paper. Among the conclusions drawn by Dr. Brown are the following:—That the Coniferae are found over the whole globe, preferring, however, the colder regions; when a northerly species spreads southward beyond the region in which it has attained its greatest development, it climbs to a height which has a mean temperature similar to that of its original locality. Every species expands in the direction of least meteorological and physical change, and has probably its own limiting isotherms, though temperature is not by any means so important a condition as moisture. Every species has a region within which it attains the climax of development, and beyond this it decreases in numbers of individuals as well as in strength. Every natural genus appears to have originated in the centre of the area within which the greatest number of its species are found; it can scarcely be doubted, however, that these centres of origin have been subjected to great geological changes, and thus many of the apparent irregularities in the distribution of plants may be accounted for. It is erroneous to maintain that in every case climate and elevation exert an influence upon the distribution of plants and animals; the geological constitution of a region has an appreciable power in limiting the expansion of species.

**West Africa.**—Another paper in the same journal, accompanied by a map, gives a complete history of the attempts which have been made to penetrate West Africa in the neighbourhood of the delta of the Ogowai river, along with a summary of our knowledge of that part of the continent. The Ogowai must be one of the main arteries of the country, but nothing whatever is yet known of its course beyond a distance of 150 miles inland from its great delta, the outmost branches of which are more than 50 miles apart on the coast. In recent years attention was drawn to the magnitude of this river, first reported by Bowdich in 1817, by Du Chaillu's journeys in the coast regions north of the Gaboon and south of the Ogowai, in the years 1856–59. The French, who have long had settlements in its neighbourhood, have at various times made efforts to navigate its waters, as yet without much success, though there do not appear to be any great barriers in the way of a determined explorer. Their first trial in 1862, under Lieut. Servat in the steamer *Pionnier*, was made in July, the season when the river is lowest,\* and soon the journey had to be continued in boats, but at a distance by river of about 100 miles from the coast, on the rumour of an attack by the natives, further progress was abandoned. Neglecting the experience of the former attempt, a second, under Lieut. Albigo and Dr. Touchard, also in the *Pionnier*, was undertaken at the same season in 1864, but, waiting till October, the expedition reached the mouth of a large tributary from the southward, named the Nguni, at a distance of about 50 miles beyond the turning point of the first trial. A third voyage in 1867 under Lieut. Aymes did not reach farther than this confluence, beyond which the main river is named the Okanda. Overland from

the Gaboon in 1864, Lieut. Genoyer, after an ascent of the coast range named by the Portuguese the Serra do Crystal, reached the Okanda above the confluence of the Nguni, and returned to the Gaboon by one of the tributary streams of that estuary. Retraversing the country south of the Ogowai visited by him in 1858, Du Chaillu came upon and traced the Nguni down towards the Ogowai for a considerable distance in 1864, previous to his longest journey inland to Ashango. In 1866 a journey was made by an Englishman named Walker from the Gaboon to the Ogowai, during which he followed up the tributary Nguni to the point at which Du Chaillu had turned, and afterwards navigated the Okanda by boat in its course from north-east to a point 50 miles above the confluence, the farthest yet reached by any European. Here in July, the time of lowest water, at a distance of more than 200 miles by river from the coast, the first hindrance in the form of rapids was encountered. The river breaks into several channels of from 100 to 300 yards in width, and has a very tortuous course. From one of the rock-islands in the river, the smoking mountain of Otombi can be seen to the north-east, and, according to native report, there is a second volcano, named Onshiko, beyond this one in the same direction. The existence of a great lake far in the interior was confirmed to the traveller by every report, but whether this forms the source of the Okanda could not be ascertained. More recent excursions by the French have completed a rough survey of the region of the delta. The Ogowai is the gate through which our knowledge of Central West Africa must be obtained.

**Dr. Schweinfurth.**—The African traveller and botanist Dr. Schweinfurth has happily returned in safety to Europe, and though he has suffered the loss of the greater part of his invaluable collections and drawings, he has brought back a harvest of information and experience which places his journey among the most successful of modern times. After his great journey west of the Upper Nile, in the country of the Niam-Niam and Monbuttu (see *Academy*, vol. ii. p. 96), he made a short excursion from his head-quarters, the Seriba Ghatta, westward to Kurkur and Danga, positions formerly visited by Petherick, and returning, planned a much more extended journey, when a fire broke out in the Seriba Ghatta on the 2nd December 1870, which not only destroyed the station, but with it the whole property of the traveller. Fortunately, a portion of his collection was at that time already on its way to Berlin. Provided with a few necessities at Seriba Siber, the head-quarters of the Egyptian troops, the indefatigable traveller made a tour in a part of Fertit hitherto unvisited by Europeans, from December 1870 to February 1871, during which he found that the Bachr-el-Arab is unquestionably the main stream of the basin which mouths in the Nile at the Bachr-el-Ghazal. Having been deprived by the fire of every instrument by means of which any mechanical reckoning of the distances traversed during this journey could be made, the explorer, with an energy perhaps unexampled, set himself the task of counting each step taken, and in this way constructed a very satisfactory survey of his route.

#### Zoology.

**The Therapeutic Use of the Poison of Various Animals.**—This practice has been revived in France by several medical men, its chief advocate being no less a person than Dr. Téphé Desmarts, the president of the Société humanitaire et scientifique du Sud-Ouest de la France. The poison is applied by inoculation. Experiments with the poison of Hymenopterous Insects, of the Weevers (*Trachinus*), and of the viper, &c. are still in progress. M. J. B. Corbiot reports on cases of intermittent neuralgia, which he has cured by the application of wasps; and Dr. Ohei relates the case of a man suffering from oedema in consequence of heart-disease, from whom all symptoms permanently disappeared, after he had been accidentally bitten by a viper. Great caution should be observed in these experiments. In Brazil it is a popular belief that snake-poison is a specific against elephantiasis. A negro whose life had become intolerable in consequence of this terrible disease insisted on the latter remedy being tried on him in the hospital at Rio Janeiro. The medical men remonstrated with him in vain, and the snake (a species of *Trigonocephalus*) was procured, but after being bitten by it, the man succumbed in a short time from the effects of the poison.

**The Origin of the Domestic Turkey.**—Hitherto ornithologists have been divided in their views regarding the origin of the domestic turkey, some believing with Linnæus that the European bird is a descendant of the wild race inhabiting the United States, others holding an opinion originally expressed by Mr. Gould, that it is the domesticated Mexican race which this ornithologist distinguished under the name of *Melagris mexicana*. Mr. J. A. Allen, in a paper on the Mammals and Winter-Birds of East Florida, which is mentioned below, devotes a separate chapter to an examination of this question, and shows that the Northern and Mexican birds are not specifically distinct. The domestic turkey, in fact, was first introduced into Europe from Mexico about 1524, and subsequently into the United States from Europe: a fact which admits

\* Corresponding to the rainy season under the equator, the Ogowai has a considerable rise in April and a lesser in October.

of an easy explanation, since in their advanced condition of civilisation the native Mexicans had succeeded in domesticating the turkey, and this their more savage neighbours on the north did not accomplish. The turkey, after having been brought to Europe nearly a century before the establishment of permanent settlements in the United States, was introduced thence into America with the other domestic animals.

**Chicago Academy of Sciences.**—The zoological collections of this institution, which were destroyed by the calamitous fire, were much more extensive than is generally supposed. It appears from a report drawn up by Dr. J. W. Foster, President of the Academy, and Mr. W. Stimpson, Secretary, that in addition to the general collection, the loss of which can be made good, several special collections were destroyed containing types which can never be replaced: among these were Walsh's State-collection of Insects; the Smithsonian collection of Crustacea which filled over 10,000 jars and contained the types of the species described by Dana, Stimpson, and other American authors; the Invertebrates collected by Stimpson on the U. S. North Pacific Exploring Expedition; the collection of marine shells of the Atlantic coasts of the United States; and finally 15,000 specimens of fossils, including two mounted skeletons of *Mastodon*. In spite of this terrible disaster the Academy is making every effort to reoccupy its place among its sister institutions. The publication of its Transactions will soon be resumed. The president and secretary appeal to their correspondents for the donations of sets of publications for the past few years to replace those lost.

**Affinities of the King-Crab.**—Prof. Owen has recently read an elaborate paper before the Linnean Society on the structure and affinities of the American king-crab (*Limulus polyphemus*), the conclusions at which he has arrived being directly opposed to those of van Beneden (*Academy*, vol. iii. p. 30). After a very minute description of the anatomy of the nervous and muscular systems of the *Limulus*, Prof. Owen thus sums up:—"Some objected to the king-crabs being called Crustacea; there was more ground, he thought, for objecting to call them Arachnida or Myriapoda. One may call *Limulus* a Crustacean, and yet discern in its anatomy the evidence of its more generalised structure than in Malacostraca; its type preceded that of either macrourous or brachyurous Crustacea, and indicates characters subsequently appropriated by and intensified in the air-breathing members of the Apteroous Insecta of Linnæus."

The officers of the New Zealand Institute have issued the third volume of their *Transactions and Proceedings*, a periodical which is not only of the greatest importance to the colony, but one fairly claiming a place in general scientific literature. We may remind our readers that the New Zealand Institute was founded under the auspices of the colonial government with the object of advancing art and science, pure and applied, as well as other branches of knowledge, and of concentrating scattered efforts under the direction of one establishment. Five provincial societies, the Wellington Philosophical Society, the Auckland Institute, the Philosophical Institute of Canterbury, the Otago Institute, the Nelson Association for the Promotion of Science and Industry, have in this way been incorporated in the general establishment, and any society which may be founded in future can likewise be affiliated if it consist of not fewer than twenty-five members, subscribing in the aggregate a sum of not less than fifty pounds annually. The proceedings of the several societies, and the papers read before them, are submitted to the Institute, which publishes in an annual volume a current abstract of the former, and under the title "Transactions" such of the papers as are of peculiar interest. The system works admirably, and the matter requiring publication increased so greatly last year that the present volume consists of 110 pages of "Proceedings," and 363 pages of "Transactions," the latter being illustrated by 30 lithographic plates. Of the sixty-eight articles admitted to the "Transactions," we shall here only refer to the more important zoological papers. Mr. Walter Buller describes a new rat indigenous in New Zealand. Important contributions to ornithology, at present the favourite pursuit of colonial zoologists, have been made by Messrs. W. Buller, T. H. Potts, Captain F. W. Hutton, and W. T. L. Travers. Dr. J. Hector, the energetic editor of the series, has taken up the study of Fishes. Finally, Messrs. L. Power and W. Buller communicate their observations on *Latrodectus*, the poisonous spider of New Zealand.

The ninth part of the *Anales del Museo Publico de Buenos Aires* (Buenos Ayres, 1871) contains a continuation of Professor Burmeister's paper on the fossil remains of the gigantic sloths which are generally comprised under the name of *Glyptodon*, but which have been divided by the author into four generic groups, *Panochthus*, *Hoplophorus*, *Glyptodon*, and *Schistopleurum*. In the present part the author treats of the second of these groups, the description being illustrated by admirably executed lithographic plates.

The second volume of the *Bulletin of the Museum of Comparative Zoology at Harvard College, in Cambridge, U.S.*, has now been completed by the issue of Nos. 3, 4, and 5. No. 3 is a lengthy paper (pp 161-450) by J. A. Allen, "On the Mammals and Winter-Birds of East Florida, with an examination of certain assumed specific characters in

Birds, and a sketch of the Bird-Fauna of Eastern North America." No. 4 contains short "Directions for Dredging," by Count Pourtales; and No. 5, Additional Remarks on *Echini*, by A. Agassiz. We have also received at the same time No. 1 of vol. iii. of the same periodical, in which W. H. Dall gives a Report on the *Brachiopoda* obtained by the United States Coast Survey Expedition, in charge of L. F. de Pourtales, with a revision of the *Craniida* and *Discinida*.

DR. WILLIAM BAIRD, Senior Assistant in the Zoological Department of the British Museum, died on Saturday, January 28, after a protracted illness. He was born in 1803 at Eccles in Berwickshire. After having served as surgeon for ten years in the navy of the East India Company, he accepted in 1841 an appointment in the British Museum which he held to the time of his death. His most important work is *The Natural History of the British Entomostraca*, published by the Ray Society in 1850.

### Botany.

**The Structure and Classification of Compositæ.**—At the meeting of the Linnean Society on February 1st an important paper was read by Mr. Benthams, the president of the society, on this subject, to which he has recently given much attention. The order Compositæ or Synanthère is remarkable not only from its enormous size, but also from its extremely natural and well-marked characters, there not being a single instance in which it is doubtful whether a plant should be referred to this order or not. All the essential characters of the androecium, pistil, structure of fruit, structure of seed, and inflorescence, are absolutely constant throughout the ten thousand species comprised within it. This very fact, however, renders its subdivision into tribes and genera a matter of extreme difficulty, the systematist being compelled to adopt characters as generic which in other orders would hardly be considered as specific. The parts of the plant from which the best distinguishing characters are derived were treated at length by the author under the following heads:—1. Sexual differences in the florets contained in the capitulum; these are sometimes constant in large genera or subtribes, sometimes variable in closely allied species. 2. Di- and trimorphism; very rare in Compositæ except as connected with sexual differences. 3. Differences in the pistil; these depend on variations in the style where it is not used for its primary purposes in connection with the fertilisation of the ova. 4. Differences in the fruit and its pappus. 5. Differences in the androecium; these depend on the minute appendages or tails which have apparently no functional office. 6. Differences in the corolla; numerous and important. 7. Differences in the calyx; these are not important. 8. Differences in the ultimate inflorescence and bracts; not of essential importance. 9. Differences in foliage; there is no type of foliage in Compositæ which may not be found in several other orders, although the leaves are never compound with articulate leaflets; the opposition or alternation of the leaves is sometimes of tribal importance, sometimes not. 10. Geographical distribution; on this portion of the subject a further paper is promised at a future meeting.

**Change of Habits in a Plant.**—We lately recorded (*Academy*, vol. ii. p. 522) a singular instance of a change of habit of comparatively recent occurrence in the case of the Kea or mountain-parrot of New Zealand. The same observer, Mr. Thos. H. Potts, has noted in *Nature* (No. 118, Feb. 1st) a somewhat similar instance of the change of habit in a plant. The *Loranthus micranthus* is one of the most showy parasites belonging to the New Zealand flora, and is nearly allied to our mistletoe. Originally parasitic on native trees belonging to the orders Violariæ and Rutacæ, it appears now to have nearly deserted these in favour of trees introduced since the colonization of the islands by Europeans, especially the hawthorn, plum, peach, and laburnum. The latter tree was only introduced in 1859, and appears now to be one of its most favourite resorts, where it is abundantly visited by the (also introduced) European honey-bee.

### Physics.

**The Relation between Density and Capillary Attraction in Saline Solutions.**—M. Valsen (*Compt. rend.* 74, 103) has determined the density D and the height of column H in the same capillary tube of a series of saline solutions, and finds the product of the density (at 15° C.) by the height of column in millimetres to be sensibly constant for all the solutions examined:  $DH = 61 \cdot 5$  or  $62$ . Each solution contained an equivalent in grammes of the anhydrous salt dissolved in a litre of water; salts of the alkaline and alkaline earthy metals, of manganese, zinc, cadmium, lead, and silver, were examined. In the cases of lithium chloride and silver nitrate, the extremes of the series employed, having the equivalents  $42 \cdot 5$  and  $170$ , the capillary heights were  $60 \cdot 8$  and  $54 \cdot 2$  mm. The capillary height may be calculated from the density, within very narrow limits, by the formula:  $H = 118 \cdot 5 - 56 \cdot 8 \times D$ , and the increase in the height of the capillary column on passing from one normal solution to another is proportional to the diminution in density of the solution.

**On the Insulating Power of Various Kinds of Glass.**—M. Ekman (*Ann. Ch. Phys.* xxiii. 349) finds that a glass containing much soda and little potash is a far better conductor than one containing little soda and much potash, the intermediate varieties exhibiting intermediate conductivity. In his experiments two slips of tin-foil were pasted, one to the centre, the other to the edge, of each sheet of glass, which, with the exception of the portion between the slips, was entirely covered with varnish. The centre slip was connected with the knob of a Leyden jar—equally charged in each case—the edge slip with the earth, and the time necessary for the spontaneous discharge of the jar then observed on each occasion. Moreover, the amount of water absorbed by equal weights of the several samples of pulverised glass was determined; and the results clearly indicate that the insulating power depends on the composition of the glass, and not on its attractive power for water. Of two glasses, the better conductor attracted the less amount of water.

**Vaporisation of Mercury.**—The *Comptes rendus*, lxxiii. 1356, contains a most important and lengthy memoir by M. Merget on the diffusion of mercury vapour. The only observations on this subject hitherto recorded are those of Faraday, who considered that the vaporisation of mercury entirely ceases at a temperature of  $-7^{\circ}\text{C}$ .; and that at temperatures above this limit the vapour given off (contrary to the general law of diffusion of elastic fluids) forms over the liquid a layer of but slight thickness, which does not exceed a few centimetres in height at ordinary temperatures. These conclusions being so entirely at variance with the present dynamical theory, M. Merget was led to study the phenomena anew; and his first efforts were directed to the discovery of a reagent of greater delicacy than gold-leaf, which, as is well known, was the material employed by Faraday as the test of the presence of the metallic vapour. He finds that paper washed over with an ammoniacal solution of nitrate of silver, or with chloride of gold, platinum, palladium, or iridium, is capable of indicating the presence of infinitesimal traces of mercury, the action of the latter on either of the above metallic salts being to reduce the metal of these compounds, and thus form a more or less intense stain on the paper. By aid of this delicate test he has proved: (1) that the vaporisation of mercury is a continuous phenomenon, that it does not even cease on the solidification of the metal; (2) that the vapour possesses considerable diffusive power, which, though not measurable with exactitude, appears to attain a limit little short of that assignable to it by the dynamical theory of gases; (3) that, like other elastic fluids, mercury vapour condenses on such substances as carbon, platinum, &c. which exert no chemical action on it, and that it passes with great facility through porous bodies, such as wood, porcelain, &c. M. Merget discusses numerous practical applications of the above principles, more especially "a method of photography without light," based on the above reducing action exerted by mercury on salts of certain metals.

**Heat evolved by the Dissolution of Metallic Oxides.**—In the *Academy*, ii. 443, we referred to a series of experiments of M. Ditté, showing that metallic oxides prepared by calcination at high temperatures evolve much more heat during solution than the same oxides do when prepared at lower temperatures. M. Marignac (*Archives des Sciences physiques*, xlii. 209) has repeated these experiments with the oxides of zinc and magnesium, and arrives at entirely different results. He finds that at whatever temperature these oxides are prepared the amounts of heat evolved by their dissolution in dilute acid are sensibly the same. Specimens of magnesium oxide, prepared from the nitrate, and heated to  $440^{\circ}$ , to a dull red heat, and to a bright red heat respectively, disengaged 852, 862, and 867 heat-units per gramme dissolved. Similarly, zinc oxide, prepared at  $350^{\circ}$ , at a dull red, and at a bright red heat respectively, evolved 261, 266, and 264 heat-units. M. Marignac found it not possible to entirely decompose magnesium nitrate at  $440^{\circ}$ , or even at a dull red heat, the respective products containing only 97.5 and 98.5 per cent. of the oxide; if then the above numbers be corrected from this error, they accord more closely, becoming 874, 875, and 876, instead of 852, &c. M. Ditté used the mercury calorimeter for his determinations; and M. Marignac is of opinion that the anomalous results which he obtained are in great measure attributable to the untrustworthy nature of this instrument.

### History.

**Councils and Ecclesiastical Documents relating to Great Britain and Ireland.** Edited, after Spelman and Wilkins, by A. W. Haddan and W. Stubbs. Vol. III.

THE first volume of this important national work contained the history of the early British, Cornish, and Welsh churches up to the year 1295, when the latter may be considered to have been absorbed in the English. The second volume, which will contain the early Scottish and Irish documents down to the time when the Irish church also became subject to England, has been delayed by Mr. Haddan's illness; and it has, therefore, been thought better to publish the third volume (which includes everything relating to the Anglo-Saxon church down to Alfred) at once, especially as it was required for the use of the Theological School at Oxford. The fourth volume will carry on the Anglo-Saxon church history to the Norman conquest. It need hardly be said how welcome a critically sifted collection of the materials of our church history is when so much doubt has rested on some of the documents, and when the fierce disputes that have arisen on so many of the facts have been still further complicated by the critical difficulties. In the first volume, the groundlessness of the so often alleged "Orientalism" of the British churches was shown, and the British Easter controversy was placed upon its right footing, viz. of a mere confusion of cycles. After the free Celtic churches had submitted to the claims of Rome, the mischief of appeals to the papacy, the gradual diminution of freedom and self-government in the native Welsh church as English influence and law were brought to bear on the principality, were well illustrated.

It is sometimes said that the change of the modern historical point of view has an unsettling effect on the mind, since so many great men, once looked at with a species of awe, are now criticised freely on distinctly new grounds. Thus Charlemagne does not hold the same exalted place as once he did, in the eyes of those who look on him as a Frankish tyrant who crushed the liberty of the free Saxons of North Germany; while similarly the character of St. Boniface is not so highly esteemed by those who think that he subjected the Germans to the rule of the Roman emperor as well as the Roman church. But these differing points of view serve to bring out the history more clearly on all its sides; the great men themselves have injustice done them unless their motives are fully allowed for, and the reasons of the course they took explained; and the result of modern enquiry has been to reveal to us something better than the great men, the emperors, and the popes. Neander first devoted himself to bringing out the really Christian inner life of each succeeding age. While the world seemed abandoned to the spiritual wickedness of

those in high places, the lives and writings of a series of men, from Bede to Izaak Walton (to take only our own country as an instance), were set forth to us as something to which men might turn with satisfaction from the blood-smeared pages of the empire or the papacy. Part of Keble's "Advent Sunday" in the *Christian Year* well expresses the character of Neander's work, and shows the change which he made in the conception of church history, of what was really worth study. Lives of Bede or Cuthbert, of Alfred or Anselm, show us that historical development of the Christian life which it was the object of Neander everywhere to trace out. Nor was he less anxious to follow the spread of the Christian movement in all directions. Nor is there a more interesting period than that in which England was Christianised, and rapidly became the basis from which to evangelise Germany and the North. The third volume, now before us, contains all the early part of this period, a period which can never lose its interest for ourselves. It is curious to see how Pope Gregory planned his new church on the lines of the old Roman provincial constitution of Britain. The two old Roman capitals, London and York, were each to be at the head of twelve sees. With the loss, however, of the Scotch Lowlands by the English kings of Northumbria, York lost its chance of equality with the southern province, and was gradually limited to its four bishoprics. The conversion of Ethelbert of Kent made Canterbury the ecclesiastical "metropolis" instead of London; and Kent having two dioceses in it, Canterbury and Rochester, preserves the memory of the time when Kent really formed two small kingdoms. York was, in Gregory's plan, to have been ecclesiastically the equal of the southern province; whichever of the two archbishops was the senior was to preside in the common synods. The later supremacy of Canterbury rested really on the civil greatness of the south, theoretically on a set of documents which labour under the strongest suspicion of forgery. Unhappily every question of this kind gave rise to forgeries, and certain of our great monasteries, such as Malmesbury, Peterborough, Croyland, have an unhappy pre-eminence in this guilt. Similarly, Gregory, having told the English that the third degree was the limit of prohibited marriages, the later canonists, who had monstrously extended the prohibition to the seventh degree (the cause of very great misery in Europe), forged a letter of Gregory to say that he had only meant the third degree to be a temporary arrangement until the English should become strong in the faith. It is curious to see how completely the Roman scheme failed. England was not to be converted according to a fixed scheme. The Gospel, under its Roman teachers, died out of Northumbria, and the whole work had to be done over again. Only in Kent can the Roman mission be said to have permanently succeeded. The real permanent conversion of England was effected by the missionaries of the free Celtic churches; they or their English disciples converted Scotland, and Northumbria, and Mercia, and East Anglia, and Wessex (the Roman missionary Birinus had, as usual, been expelled); and Wilfrid, coming from the north, found, even at the last moment, Sussex unconverted, though so near to Kent. Wilfrid, however, had been attracted by the superior civilisation and the exalted claims of Rome, and he bowed the free English churches to submission. Theodore, a Greek of Tarsus, was sent by Pope Vitalian to organize the English church—and he organized a diocesan system throughout the country. The parochial system has also been attributed to him; but it is of later origin, and the mistake arose from construing "parochia" as if it meant *parish*, whereas the word really means *diocese* up to the twelfth century. To Theodore was also due the organiza-

tion of a system of church discipline which had important consequences. And here our authors have done excellent service in extricating the genuine "Penitentials" of Theodore, Bede, and Egbert from the mass of alien matter with which they had become encrusted in the course of ages. Additions from much later systems, and a great infusion from Frankish sources, had thrown the whole subject into confusion. Rules from Charlemagne's Capitularies, from a work of Theodulf of Orleans (A.D. 797), from one of Halitgar of Cambrai (A.D. 825), had been mixed up with the English rules. The genuine Penitential, compiled by a disciple of Archbishop Theodore, still exists in a MS. of Corpus College at Cambridge; while Wasserschleben, in his *Penitentials of the Western Church*, published at Halle, 1851, has given us the genuine work of Bede; and the genuine work of Egbert is contained in the Bodleian MS. 718 of the tenth century, which Bishop Leofric gave to Exeter cathedral. The sharp discipline of these codes shows how rude the state of society was, and the list of crimes (as in the Frankish regulations) gives an appalling picture of human degradation. Something, however, may be allowed for the Roman custom of stating every possible case, and one would fain hope that many of the unutterable abominations mentioned were not common; some of them look like the dreaming imaginations of corrupt monks. The light, however, thrown on the relations of the different ranks of society, and the state of manners, is very considerable. Another set of the documents collected by our authors consists of the "professions of faith" made by newly appointed bishops to the primate. One of the most curious on the roll at Lambeth is that of the Cornish bishop Kenstec to Archbishop Ceolnoth, before the year 870. The earliest of all is that of Eadulf, Bishop of Lindsey, in 796, and the word "Eboracensis" has been interpolated in it, as evidence of the supremacy of Canterbury. That of Denebert of Worcester, in 798, is important as quoting the Athanasian Creed—the first mention we have of it in England—"Scriptum est, Quicumque vult salvus esse ante omnia opus est illi ut teneat Catholicam fidem," &c. This would agree with the view which assigns to Alcuin, the English friend of Charlemagne, such an important place in connection with it, for this is just when Alcuin was at the height of his activity. A number of Alcuin's letters are included in this volume, some of them as yet unedited. One of them contains the earliest mention of the *Ordo Romanus*. In several letters he urges on his friends the use of St. Gregory's Pastoral. It was enjoined upon all bishops at their ordination in France under Hincmar, and was translated into English by Alfred. Another important set of documents is supplied by the Anglo-Saxon charters (published mainly by Kemble in his *Codex Diplomaticus Aevi Anglo-Saxonici*). They prove the existence of many more synods than the historians mention. One of the strangest things is that Archbishop Theodore should have appointed Cloveshoo as the regular meeting-place, and that some important synods were held there, and yet that the place cannot really be identified. It was near London (then part of Mercia), for St. Boniface speaks of one of them as "Synodus Londinensis;" but the attempts at identification are mere guesses. Our authors discuss at length the charters of Ethelwulf, which were long supposed to have been the legal origin of the payment of tithe in England, and which Kemble has so acutely examined. Unfortunately the question is complicated by the very large number of forgeries. It is painful to see the amount of forgery of which the churchmen were guilty. Of the 240 charters in Kemble's first volume (the whole of which come into this period), about half are spurious. Professor Stubbs has found it necessary to mark even more than Kemble had done.

They are detected by the errors in the dates, the impossible sets of witnesses, the later style of the description, and by other clear evidences. A new edition of Kemble's *Codex* is much wanted, which should include the remaining Anglo-Saxon charters (there are some scores of them not included in it), with the Anglo-Saxon descriptions of property, &c. translated. Much help as to the dates is supplied in the work before us. It has been well pointed out by Kemble that during about eighty years the Anglo-Saxon Chronicle is wrong by two years, the northern chroniclers giving the right dates. Thus Egbert is usually supposed to have begun his reign in 800, while the real date is 802. With this view all the genuine documents here collected agree. Forged papal bulls and letters too exist in considerable numbers, and we cannot too much praise the care and skill with which all these documents have been investigated. The student meets with the same difficulty in reading early church history, where the forged writings assigned to the early fathers equal the genuine ones in amount. There is some reason to assign a certain part of the interpolations in genuine patristic writings to the age of Alcuin, when official copies were made of the old church documents. In England something is perhaps due to the age of Dunstan, as respects the charters—something to that of Edward the Confessor; but the *scriptorium* of a great monastery was the workshop where these formidable weapons of attack or defence were being continually produced. The pious fictions of the early Christian king Lucius, of St. Paul's having himself preached in England, and so on, stand on a different ground—they are merely instances of the growth of legend; but the former kind cannot be excused, for they are conscious inventions—like the forged donation of Constantine to Pope Sylvester or the False Decretals. If any of them were done with a pious object, or with any worthy motive whatever, it would be a heavy punishment to their authors to know what a cloud of doubt their acts had spread over church history and on many of the things they valued most. All the more are our thanks due to those who have not been afraid to sweep away the time-honoured impostures, and trust to the truth alone to make its way. The confidence placed in them, in their conscientious regard for truth and admirable consistency in searching it out, is and will be a true reward.

C. W. BOASE.

**The First English Conquest of Canada;** with some Account of the Earliest Settlements in Nova Scotia and Newfoundland. By Henry Kirke, M.A. Bemrose.

THIS volume suggests to us that the charge of keeping alive the memory of brave men—that old prerogative of the “sacred poet”—has in modern and prosaic times become the special province of the Record Office. Our colonial state papers of the seventeenth century have chiefly furnished Mr. Henry Kirke with materials for the biography of an ancestor respecting whose brilliant though abortive conquest of Canada and Nova Scotia under Charles I. neither Haliburton nor Macgregor knew enough to give more than a bare and very inaccurate notice. In 1627, on war breaking out between France and England, certain London merchants obtained a royal patent authorising them to break up all French settlements in those provinces, and to establish English plantations in their stead. As a preliminary step, they sent out three ships well manned and equipped; Captain David Kirke, the eldest son of a member of the company, being in command of the expedition. Its immediate object was to intercept a large French squadron, then on its way to Quebec, and conveying emigrants, artillery, and heavy stores. This was fallen in with and attacked on the St. Lawrence; its admiral, De Roquemont, whose over-freighted ships were

unfit for fighting, found it necessary to surrender after the first broadside, and Captain Kirke had the no small satisfaction of bringing his own fleet of three sail back into English waters with 138 French cannon in their holds, and De Roquemont with other prisoners who could afford ransom on board. Only we could wish that the narrative of so spirited and successful an adventure had told us what became of the crowd of non-combatants taken with the eighteen captured vessels; are we to infer from this silence that the merchant-adventurer had as few qualms of “nyce conscience” as Chaucer's shipman, and does the “fury of the French king and council” when news of the disaster reached Paris, with the burning of Kirke in effigy in the Place de Grève amid popular execration, point to a deed of blood not justifiable even by the barbarous war-code of the time? The seizure of this convoy gave the brave captain the key of Quebec and its dependent settlements by cutting off their supplies; they fell one by one into his hands, in a second expedition made with a larger force, when, having taken possession of the whole country, he came home again triumphant in the autumn of 1629. In England, however, a bitter disappointment awaited him. During his absence peace had been concluded, under the articles of which all Kirke's new-made conquests were to be restored, and all merchandise seized at the taking of Quebec was to be given up to its owners. Falconbridge's “foot of honour” was the sole set-off the luckless hero could obtain against his broken hopes and damaged fortune; the De Roquemont arms, with their lion prostrate and chained, were added to his escutcheon, and he was subsequently knighted. Having soon after his return from Canada succeeded to an ample patrimony, and having taken a wife from a family as rich as his own, a bright and prosperous life in this country lay before Sir David Kirke. With such a prospect, few men would, after his past experience, have desired to tempt fortune once more in the New World. But his was one of those rare natures, eager, dauntless, resolute, which remain unchecked by disaster and untamed by wealth. Keeping steadily in view, as his chosen task in life, the conduct of some extensive scheme of colonisation, he waited patiently for a fitting opportunity. This offered itself when Lord Baltimore, the governor of Newfoundland, disgusted with the climate, and galled with the difficulties of an infant settlement, deserted his colony. In 1638, Sir David Kirke, having obtained a grant of the whole island, sailed out as its ruler. During the next twelve years while the energies of the mother-country were spent upon civil strife, Kirke was patiently developing the resources of Newfoundland; above all, the fisheries, in which his practical sagacity recognised the true basis of its prosperity. Upon the rupture between Charles and his parliament, he declared for the king, to whom, when his affairs grew desperate, he offered an asylum; he also proffered aid to Prince Rupert after Charles' execution. For these things there came in 1651 a day of reckoning for the high-church and royalist governor, who was cited to appear personally before the Council. What we gather from the narrative of the transactions—which however does not tally with the statement made p. 186—amounts to this, that after some delay and pecuniary loss through temporary sequestration, the matter ended in Kirke's forfeit only of the ordnance and forts in Newfoundland; he retained both his office and all his private property. All circumstances considered, he was leniently dealt with, and we think that biographical zeal carries the author too far when he talks of his hero's “spoliation” by the Commonwealth. But it strikes us that this word exactly applies to the act of the king who stripped his widow and children of the home where his own father had, in time of direst need, been offered shelter. Sir David Kirke died in 1655–6, and after the Restoration,

Charles II., probably urged by court favourites, issued a warrant depriving the family of their Newfoundland estates, in favour of the heirs of Lord Baltimore, who on giving up that island had obtained a grant of Maryland in its stead.

Apart from the interest which invests the personal history of an early ruler and shaper of a now prosperous English colony, this narrative has, we think, a special significance as the history of a career typical from first to last of that tragic incompleteness which marred the lives of so many of our early maritime discoverers and adventurers. Sir David Kirke suffered, dared, and wrought much in his time, yet fate denied him the just guerdon of endeavour. Men of kindred character have, with not more than equal chances, established states, and founded dynasties; Kirke's early conquests were no sooner won than wrested from him, and after his death his sons were robbed of their heritage. His heroic qualities, with the service England reaped from them, might have given him some place on the roll-call of her worthies; it has been left to the piety of a remote descendant to revive his forgotten name and neglected memory.

GEORGE WARING.

### Intelligence.

V. Palmé advertises his reprint of the *Gallia Christiana*, a sort of conclusion to his excellent reprints of the *Acta Sanctorum*, the *Histoire littéraire de la France*, and the French Historians. The book is reprinted exactly, but large supplementary matter is added. The old edition was defective in several ways; and as to the monasteries, it could not be compared to our own *Monasticon*. The reprint of these four great works does the highest credit to French energy.

We would call attention to the Ohio Valley Historical Series of Reprints (Trübner), e. g. that of Bouquet's expedition against the Ohio Indians in 1764, Colonel James Smith's captivity with the Indians, and other works illustrating the border history of the United States. The importance of the positions on the Ohio (e. g. Pittsburgh, so named after the elder Pitt) was well known to the French when they tried to make a chain of forts to connect Canada with Louisiana. Washington's first appearance in history is in connection with the attempt of the Ohio Company to form settlements there in opposition to the French attempts to prevent the English colonies from extending westwards.

### Contents of the Journals.

Lit. Centralblatt (Dec. 13) reviews Roerting's Old-French translation of Ovid's *Remedia Amoris* (a part of the allegorical poem *Les Echees amoureux*), important for its relation to the *Roman de la Rose*, and as illustrative of the dialect of Picardy (e. g. *empessee* for *empêche*). A mention of the "Constable Bertran," i. e. Bertrand du Guesclin, as a knight worthy to be compared with Hector and Gawain, fixes the date of the work to the last part of the fourteenth century.—Jan. 6.—A review of Kapp's *Frederic the Great and the United States of America* points out Frederic's views as to the rights of neutrals, and as to privateering, and rejects the American claim of having done much for international maritime law.—Jan. 20.—Notices Kraus' *English Diplomacy in 1527*, when, owing to Ferdinand I.'s threatening attitude in Burgundy and Italy, Henry VIII. showed sympathy with John, King of Hungary, and Zapolya, the Voivode of Transylvania. One of the letters of Ferdinand to Henry mentions the disastrous battle of Mohacs, by which the Turks gained most of Hungary.

Gött. gel. Anz., Dec. 20.—Reviews J. van Lennep's *Travels in Asia Minor* very favourably (see *Academy*, vol. i. p. 224).—Geiger continues his account of the Humanists; this time he gives an account of Charitas Pirckheimer, the Abbess of St. Clara in Nuremberg—one of the few German ladies of that age who are interesting in this point of view.—Konrad of Würzburg's *Parthenopier und Meliur*, &c. is noticed as important in the history of medieval romance. "Parthenopaeus" has attracted the attention of Sir Walter Scott and S. Rose among ourselves.—Jan. 3.—Compares Piot's *Cartulary of S. Trond* (near Liège) with Wauter's book "on the origin of the communal liberties of Belgium," which serves as a sort of commentary on the former. The earliest charter of liberty which we know of for the cities in the north of Europe is that given by Bishop Theoduin of Liège to Huy, in the eventful year 1066.—Geiger reviews an account of another of the Humanists, "Franciscus Fabricius Harkodurasius" (1527–1573).—Jan. 10.—Analyses Hehn's excellent book, *Kulturpflanzen und Haus-*

*thiere*, and Claretta's *Storia diplomatica dell' antica abbasia di S. Michele della Chiura*, important for Piedmontese history.—Jan. 24.—Contains a good account of the life of the Sicilian patriot, the Prince of Castelnuovo, who upheld the Sicilian constitution against the absolutist Queen Caroline, when she took refuge from Napoleon in the island. He suffered grievous imprisonment, and was not delivered till Lord W. Bentinck freed the prisoners and restored the reign of law. Unhappily, England failed to maintain the constitution after 1815, and Castelnuovo retired into private life, and spent his time and means in founding an agricultural institute and elementary schools, which were of the greatest benefit to his country in the evil times.—Jan. 31.—Wilken gives a summary of his researches as to the mystery plays of Germany in the middle ages, and compares them with those of France, &c.—There is also a notice of Hartmann's *Rede vom Glauben* (published from one of the Strasburg MSS. now burnt); and a spiritual poem of the twelfth century, apparently by an author who lived in Central Germany.

### Philology.

Aeschylli quae supersunt in Codice Laurentiano veterrimo. Edidit R. Merkel. Oxford: Clarendon Press, 1871.

THIS magnificent volume, at once a literary curiosity and a valuable aid to critical students of Aeschylus, stands on a par with the texts of the Vatican and Sinaitic MSS. of the New Testament as edited by Tischendorf, and of the Codex Bezae of the same by the Rev. F. H. Scrivener. The plan of all these is to represent, in ordinary Greek type, but with the minutest accuracy that is attainable in every particular, the actual text of the MSS. themselves. Obviously, if the task is performed in a perfectly trustworthy manner, this kind of transcript is much more generally useful than even photographs of the originals would be; for the one is very easy, while the other is often exceedingly difficult to read. The Medicean MS. of Aeschylus, now first presented to us entire, is one of the most difficult MSS. to decipher. A facsimile of it is not given in the present volume, to which we venture to think that a photographed page of the original codex would have formed an interesting and suitable frontispiece; but a specimen of the very crabbed, and, to ordinary eyes, well-nigh illegible, writing of the MS. is given in p. 140 of Dindorf's edition of the Scholia (Oxford, 1851).\*

\* Page 140 of the MS., being page 43 of Merkel's folio, and containing *Choeph.* 373 to 416.

this we see at a glance that the scholia were appended by a different hand. They are in a cursive or semi-cursive character, much more legible than the text itself, and more approximating to the uncial form. The scholia, we regret to say, are not given at all in Merkel's volume. A careful consideration of them, *i. e.* a comparison with the text of the codex, will show that they must have been taken from some other copy than that from which the text itself was transcribed. They do not in all points harmonize with the readings they profess to illustrate; and it is highly probable that they were added by another and rather later hand and from some other source, after the text had been written. To illustrate this by an example or two from one play, though many might easily be given: in *Supplices*, 452, ἡ κάρτα νείκους τοῦδ' ἐγὼ παροίχομαι, the schol. has καὶ τοῦτο ποιῶν ἐκτὸς ἔσομαι τοῦ νείκους θεοῖς ὑπηρετῶν. Critics well-versed in tragic usage know that ἐγὼ is hardly used unless there is emphasis on the person, which here has no place.\* The true reading is τοῦτο δρῶν παροίχομαι, and θεοῖς ὑπηρετῶν was originally an independent scholium on the words τοῦτο δρῶν. Again, in *Suppl.* 879, ὁ σε θρέψας ὁ μέγας Νεῖλος, "that mighty Nile that nurtured you with its life-giving waters," is corruptly given in the Med. ὁ δ' ἐρωτᾷς (*sic*) ὁ μέγας νεῖλος, the ψ having been mistaken for T, which it closely resembles in uncial writing. So in *Ag.* 1566, πρὸς ἄτῃ was written in the Med. for προσάψαι, as we may judge from the existing transcript, the MS. Flor. To the true reading, ὁ σε θρέψας, the gloss in the margin of the MS. evidently refers, ὁ Νεῖλος σε.

The MS. itself is believed to have been written in the eleventh, if not the tenth, century. It is the sole authority for four out of the seven plays, in so far as the few other existing copies are but transcripts from it. The greater part of the *Agamemnon*, and the beginning of the *Choephores*, have been torn away; and as the evil deed must have been done, as we know from the transcripts and early editions, some centuries ago, the chance of recovering the lost pages is, of course, though not absolutely impossible, well-nigh hopeless.

It seems by no means improbable that after the lamentable destruction of the great Alexandrian library, A.D. 651, a search began to be made, two or three centuries later, for such transcripts of the classic authors as had been taken, either for private or for public purposes, from the books at Alexandria or Pergamus, while those great libraries still existed more or less entire. Such transcripts (assuming their existence) would be of the highest authority, as being taken from the texts critically edited by the great scholars who flourished in those seats of learning. They would certainly have been written in uncial letters; and the copies from them, though made in the cursive, would be pretty certain to afford indications that uncial characters were under the eye of the copyist. In fact this is very often the case with the Medicean Aeschylus, which presents abundant proofs, in the very mistakes committed, that the archetypus was in uncial characters, and was mis-read by the transcriber. Such letters as A, Λ, and Δ, are often confused, as κεασαι for κέλσαι, *Suppl.* 16; ἀννοισιν for λίνουσιν, *ibid.* 132; δεξόμενον for ἀεξόμενον, *ibid.* 856; and Γ, Τ, Ι, as τὸν ταιον for τὸν γάιον, *Suppl.* 156; and, probably, ἀγρεῖ for αἰρεῖ in *Ag.* 126. Again, Ο, Θ, Ε, C, are confused—as ἀρόεντ' for ἀρθέντ', *Suppl.* 2; perhaps θραρέ for ἐπάρη in *Cho.* 415; εἶο ἐν for εἶεν, *Suppl.* 66; τὸ θύλος for τεθαλώς,

*ibid.* 105; φωνεῖ δ for φωνεῖς, *Cho.* 374. None of the above mistakes could have occurred if the original copy had been in a cursive hand. Similarly, II has been mistaken for TI in *Suppl.* 776, and so γὰ βονῖτι ἔνδικον σέβας has been written, against the metre, for γὰ βούνι πάνδικον σέβας. The true reading is preserved by Hesychius; βούνης γῆ· Διοχύλος. Of this class of early, and, we are disposed to think, trustworthy, codices, the Medicean MS. of Tacitus, the Ravenna MS. of Aristophanes, the Apollonius Rhodius of the Laurentian library at Florence, and the Laurentian Sophocles, preserved in the same volume as the Medicean Aeschylus, and by the same hand or hands, may probably be reckoned as examples. Merkel says that the first quaternion of leaves in the Aeschylus has been written at a somewhat later age than the rest, and that the scholia agree much more accurately with the text in the later than they do in the earlier part. "Ea scholia in primo Aeschyli quaternione conveniunt egregie suntque adcommodata ad scripturas et verborum poetarum conformationem omnem" (Praef. p. 6). It is of infinite importance to the critical determination of the text (as far as that can now be done) that these scholia represent a different and probably earlier recension.

The transcriber of the Medicean, then, had to copy an uncial MS. of very early date. In many parts it was so obliterated as to be nearly illegible; notably so in the chorus of the *Supplices*, 776-901. A good deal of this ode, as written in the Medicean, is downright nonsense; and it has exercised, more or less successfully, but, after all, with very doubtful results, the ingenuity of the critics. The transcriber was a conscientious man, and, happily for us, he appears to have known very little Greek. He therefore preferred to write what was and is mere gibberish, where he could not rightly decipher his codex, to making attempts at emendation. So we now have ἰὸφ ὁμ' αὐθι κάκκας (827), αἰμονεο ὡς ἐπάμιδα ησδονπια τάπιτα (848), βάτεαι βαθνιμ τροκακά παθῶν (864), λυμασις ὑπρογασυ λασκέι (877), and similar absurdities. That the archetypus was early uncial, and that the scribe knew little or nothing at least of ancient Greek, is clearly shown by two facts: the letters were written continuously and without division of words; and the scribe did not know how to divide the words in his cursive copy. Thus, at first glance, the codex throughout presents the singular appearance of verses written with the letters almost as often placed at wrong intervals as at right. It is impossible to conceive that a scribe who comprehended the meaning of the first two lines of the *Prometheus* would write them thus:—

χ θονὸς μὲν εἰ σπηλο υρ ὃν ἦκο' μὲν πέδο ν  
σκήθην ἐσόμενον, ἄβατό ντ' εἰ σ ἐρ ἡμί αν.

The accents (which are often given, but generally by an after-hand, in uncial MSS.) he seems to have copied faithfully; indeed (and the fact is curious), this is always the most accurate feature in Greek MSS. of all ages, mistaken or false accents being extremely rare. Very frequently an attempt has been made—whether by a later hand, we know not—to connect the letters to the right words by a line or an underbracket, *e. g.* χ-θονὸς in the above passage, ἐν γνο πέδα σ in *Prom.* 168, χεῖ μων ο τυπωι in *Suppl.* 35, οὐ κὰν ευ-θ-ε-ῶ ντι νόσ (οὐκ ἄνευ θεῶν τινός) in *Pers.* 164. We must, however, confess, on carefully comparing Dindorf's facsimile with Merkel's text, our doubts that these connecting lines are not always faithful copies of the transcriber's hand and intention. In cases where a very obvious letter might have been supplied by the most ordinary scholar, our worthy transcriber (we thank him heartily for his conscientious scruples) preferred to leave a blank or

\* This remark throws a great doubt on the truth of a rather celebrated emendation of Porson's, *Agam.* 1291, "Αἶδον πύλας δὲ τὰσδ' ἐγὼ προσ-εννέει, for τὰς λέγω. The true reading seems to be τὰσδ' ἔχω προσεννέπειν, as λέγω and ἔχω are known to be sometimes confused.

a dot,\* to show that he could not certainly decipher it in his MS. Thus, in *Theb.* 2, he wrote δ...ω for δστις, in *Eum.* 6, τι ταν ἰ σ. ἄλλ... πᾶσ χθον δ σ καθέξετο, and just below (9),

λ ἰπὼνδὲ λί μνην. δ... λία... τε χοι ρ ἄδα,

though ἄλλη and δηλίαν (Δηλίαν) χοιράδα were clearly right. In *Prom.* 480, οὐ χριστὸν is written οὐχρ... στὸν, in 492, ξυνεδρίαί is συν ε... ίαι, &c. In many cases a comma has been added underneath, to show the separation of united words, as σπλάγχμων τε, λειότηρα, signifying that the noun was not τελειότης, *Prom.* 493, νέικου, στ-ὄνδ, *Suppl.* 452, οἱ τε, τὸς-οὐσων for οἱ τε τὸ Σούσων, in *Pers.* 15, where τερὸς formed one word by the first hand. On the whole, then, the Medicean MS. of Aeschylus is very trustworthy on these two points; it was certainly taken from a very old copy, and it certainly was not in the least or minutest matter tampered with by the copyist. The chief source of doubt thrown on our text (apart from merely accidental corruptions) is the fact that there must have been other ancient recensions of the plays, since the existing scholia, as we have already said, do not in all cases harmonize with the Medicean text. We think that Merkel's somewhat brief preface, which is not particularly interesting or explicit (and which, moreover, is written in rather "crabbed" Latin), might well have pointed out some of the inferences we have ventured to draw. The principal points which he does put forward with respect to the codex are briefly these:—

1. That the loss of the greater part of the *Agamemnon*, and part of the prologue of the *Choephoree*, took place before the MS. was brought from Byzantium into Italy in 1423.

2. That fourteen pages of the MS. were lost subsequently to the original mutilation. If we understand aright Merkel's rather obscure argument, an inscription of about that period in the MS., at the end of the *Supplices*, enumerates among the contents of the then existing codex the *Agamemnon* τὰ μετὰ τὴν ὀλῶσιν τοῦ Ἰλίου, and the *Choephoree* "by name." The words are written in very contracted form, and the interpretation of them is ours, not Merkel's. The syllable ωλ is written over αλ, but a little beyond it. Does this mean ὀλῶλε, *i. e.* "the part of the play subsequent to the capture of Troy, is lost"? For the *lacuna* in the MS. is from 310 to 1066. The *Choephoree*, as is well known, in the present state of the MSS., and in the two earliest editions, is continued without the title, as part of the *Agamemnon*. Hence it appears that the first part of it was torn out subsequently to the above inscription.

3. That the first *quaternion* of the Aeschylus was written by a different hand from that of the Sophocles which precedes, and is somewhat later than the rest of the Aeschylus.

4. That the scholia in the first *quaternion* agree with the recension of the text they illustrate, while the scholia to the rest belong to one considerably different.†

5. That the original writing has been extensively retouched and altered by a later, but still early, hand, to suit the readings of the codex from which the scholia were copied.‡

\* Merkel, however, does not say whether the dots printed in his text are in the codex, and whether he intends them, or the scribe intended them, to represent *erasures* or *omissions* of letters.

† "Aeschyli quaterniones posteriores decem verborum poetae longe diversam habent recensionem ab ea, quam scholia sequuntur." (Praef. p. 6.)

‡ "Manus recentior, plerumque manifesta scholiorum scribae, toto corpore, singulis plus sexagies interdum paginis, erasis aut oblitteratis primae manus scripturis intulit quaecumque in eo exemplari, unde scholia deprompta sunt, discrepabant, omissis scilicet quae excedebant patientiam." (Praef. *ibid.*)

6. That the numerous errors in the codex are due to the fact that it was written at a period when accurate knowledge was at a peculiarly low standard; but that, as no attempt at correction by guess or fraud was made, the true principle of emendation must rest on the endeavour to correct the mere blunders of the scribe.\*

Whatever may be the faults and shortcomings of this edition, we must allow that the task was an exceedingly difficult one, and that it has been executed in a manner that reflects the greatest credit on all concerned in it. The MS. itself is so difficult to read that in almost numberless points it will seem to one eye to mean something slightly different from the reading copied from it by another. Thus, in the facsimile page of Dindorf, already alluded to, ἄλλα διπλῆς γὰρ τῆσδε μαράμης is written quite regularly, as any one well acquainted with Greek MSS. would admit; and we do not think that Merkel correctly prints it ἄλλὰδ-ι πλῆς γὰρ τῆσδε-μαράμης, the ε being continued to join the μ after the regular custom of the cursive writers. Again, the facsimile seems to give χέρες οὐχ δσσει rather than δσαι.† In *βροτῶν τλήμονι καὶ πανούργωι* the facsimile shows nothing of the spots given by Merkel, τλήμον... καί, which should indicate lost or obliterated letters. What the facsimile gives as *θινομένου*, Merkel edits as *θένομένου*, which, no doubt, is more likely to be correct. Dindorf's ὀλλυμένης is Merkel's ὀλλυμένης, and ἔμπα ποτᾶται seems in the facsimile to be ἐμποποτᾶται. And if all these discrepancies occur in a single page, it will readily be granted that nothing short of photography would present to us the original codex in a thoroughly satisfactory manner. F. A. PALEY.

#### PRONUNCIATION OF LATIN.

##### TO THE EDITOR OF THE ACADEMY.

Hampden Sidney College, Va., Jan. 23, 1872.

SIR,—In connection with the very interesting discussion begun some months ago, and lately resumed in the *Academy*, concerning the proper function of the Latin *u* consonant, will you permit me to call your attention to a passage of Velius Longus? I quote (from Putsche, p. 2223): "V literam digamma esse interdum, non tantum in his debemus animadvertere, in quibus sonat cum aliqua aspiratione, ut in *valente* et *vitulo* et *primitivo* et *genitivo*, sed etiam in his quibus confusa haec litera est, in eo quod est *quis*."

I do not propose to attempt to point out in technical terms the scope of these words, but will venture to ask whether the grammarian, while revealing to us this his view of the different power of *u* consonant in the situations respectively described, could have used language more appropriate to Eng. *v* on the one hand (*cum aliqua aspiratione*) and to Eng. *w* on the other?

WALTER BLAIR.

#### Notes and Intelligence.

Syed Ahmed Khan, in the *Pioneer*, has reviewed Dr. Hunter's book, *Our Indian Muslims*, whose views on Wahabism have lately been so much discussed by Indian newspapers. Syed Ahmed feels himself called upon to enter his protest against Dr. Hunter's opinions, which, in spite of the amicable sentiments he expressed, were calculated to do great harm to the Muhammadans. He agrees with Dr. Hunter's statement, that "Wahabism is a system which reduces the religion of Muhammad to a pure theism;" but according to the reviewer the Wahabis—or Ahal-i-Hades, *i. e.* believers in the sayings of the prophet—are not merely the followers of the doctrines started by Abd-ul-Wahab, but were dissenters from the four orthodox churches so named after four doctors, and established in the second century of the Hegira, viz. the Hanafi, Shafai, Malki, and Humbali; as such they had gradually become hateful to the masses, and in Muhammadan law-books were held up to the execration of the Faithful. The numerous *Futuas*

\* "Emendatioe in omnibus utendum erit simplici, quae unius aut alterius litterulae dispendio peragitur." (Praef. p. 8.)

† In *Theb.* 824, we have *ρύεσθαι* for *ρύεσθε* (probably from an ancient variant *ρύεσθαι*).

issued by various Moslem divines, at the request of their co-religionists, and deciding that the Muslims of India were not in duty bound to rebel against the British Government, were not of modern date, but had existed for hundreds of years. "The followers of Islam in India required no fresh teaching of the doctrines and obligations enjoined on them by their religion;" but they had only deemed it necessary to re-issue those *Fatwas* "when accusations of disloyalty and statements of the obligation of Muhammadans to be disloyal were becoming more and more numerous."

The subject of *Fikhd* has also lately been treated in a paper read at a meeting of the Royal Asiatic Society, by Mr. N. B. E. Baillie, and printed in the Society's *Journal*.

The publication of Littré's great dictionary continues regularly. The 26th part (Scille—Souscirre) is out; and it is announced that the whole work will be completed before the end of the present year.

### Contents of the Journals.

**The Indian Antiquary**, ed. by J. Burgess, No. 1 (Bombay, January 1872).—Editor's introductory remarks. [This monthly journal is to be a medium of communication between archaeologists in the East and West on subjects concerning the manners and customs, arts, mythology, literature, history, antiquities, &c. of the people of India.]—On the present position of old Hindi in Oriental philology; by J. Beames. [The modern Aryan group of languages of India has been developed from the primitive Aryan by the same process as that by which the Romance group has evolved itself from the Latin. For a general study of the hitherto much neglected vernaculars of the mediæval and modern periods printed editions of works such as Chand Bardai's Hindi epic *Prithirāja Rāsa*, which was composed about A.D. 1200, are much needed. Complete and correct MSS., however, are very rare; and the language is by no means easy, as the early Hindi poets fall in that transitional period when the case- and tense-endings of the old synthetical system, as represented in the Sanskrit and Prakrits, had become so abraded and corrupted that they no longer sufficed to distinguish clearly the relations of words, and were gradually supplanted by the system of particles, pre- or post-positions, and auxiliaries whose use constituted the distinguishing characteristic of the analytical stage.]—The *Āpastamba-Sūtra* of the Black Yajurveda, and the commentaries, &c. belonging to it; by A. C. Burnell. [Of this, the most important, *Sūtra* of the Trittirīya Yajurveda; Mr. Burnell has at last discovered a complete MS. belonging to a Brahman in the Tanjore district, who unfortunately does not seem inclined to part with it, or allow a copy to be made. The whole consists of 30 *prāṇas*: 1-24 containing the *grānta* rites; 25-27 the *grihya* portion; 28 and 29 the *Dharmasūtra*; and the last the *Sūktasūtra*.]—A Legend of Serpent Worship; from Bhaunagar in Kāthiāwād; by the Ed.—Manners and customs of the Dards; by Dr. Leitner. [Accounts of the amusements, beverages, birth and marriage ceremonies, funerals and holidays of the Dards.]—A Tāmra patra or ancient copper-plate grant from Kāthiāwād, trsl. by Ramkrishna Gopal Bhandarkar. [This is a grant of the Vallabhi king Dharasena IV., the twelfth in Anderson's list (Bombay B. As. S. S. Journal, vol. iii.). The genealogy down from Bhatārka does not vary from that given by two other plates already published; but some plays on certain grammatical terms and the name of Pāṇini, as *Sāldatūrya*, had been missed by former decipherers.]—On the identification of various places in the kingdom of Magadha visited by the pilgrim Chi-Fah-Hian (A.D. 400-415); by A. M. Broadley. [A solitary hill mentioned by Fah-Hian at a distance of 9 *yojanas* S.E. of Patna is here identified with a rocky peak at Bihār, contrary to Gen. Cunningham's identification of it with Giryak (*i. e.* Giri-eka). Further, the fortifications at the foot of the Baibhār and Vipula hills, three miles S. of Bārgāon (Nālanda) are identified with Rajgir, though Fah-Hian, according to his translators, makes it one *yojana* W. of Bārgāon.]—Pāṇini and the geography of Afghanistan and the Panjāb; by Prof. Ramkrishna Gopal Bhandarkar. [Some proper names occurring in Pāṇini and his commentators are here identified with names of places, &c., as *Vallabhi*, *Ujjayini*; *Kāpisi* (= *Kapisiene* of the Greek and Roman geographers, the northernmost kingdom of Afghanistan); *Bikshoda* (= *Archosia* ?); *P. Varṇu* = Hwan Tshang's *Fa-la-nu* (by others identified with *Vaneh* or *Banu*); *Gandhāra*-country; river *Suvastu* (= mod. *Svat*, a tributary of the *Kabul* river); *P. Varāṇa* = the *Aornos* of Alexander the Great (Wilson, *dvārāṇa*; Cunningham, from *Rājā Vara*); *Parshusthāna* = Hwan Tshang's *Fo-li-shi-sa-lang-na* (*Ortospan*, the modern *Kabul*); *Sānkala* = the *Sangala* destroyed by Alexander; *Parvata* = Hwan Tshang's *Pa-la-fa-to*; *Mālavā* and *Kshudrakā* = the two tribes *Malii* and *Oxydrakæ*; *Shaubryas* = the class *Sambracæ* or *Sabracæ*.]—Progress of Oriental Research in 1869-70. [From the Report of the Royal Asiatic Society.]—Reviews (favourable) of S. Beal's *Catena of Buddhist Scriptures*; C. E. Gover's *Folk-songs of Southern India*; Ardaseer Framjee's *Hindustanman Musafiri*, or Journal of Travels in India.—Miscellaneous. [Mr. Ravenshaw's *History of Gaur*; Shri Harsha, a paper

by Dr. Bühler; The Selons; Rock-temple at Harchoka; Coin of Firuz Shah Zafar; Oriental studies at Cambridge; Revision of the Sinhalese Buddhist Scriptures; &c.]

**Revue Critique**, Jan. 20.—A. Bergaigne reviews Benfey's essay, *Ueber die Entstehung und Verwendung der in Sanskrit mit r anlautenden Personalendungen*.—E. Tournier gives us an elaborate and on the whole appreciative account of Vollgraff's *Studia Palaeographica*, but strangely overlooks one or two important facts, *e. g.* that the book is not intended to be an exhaustive treatise on the subject, and that the author is a disciple (and indeed a most promising one) of the school of Cobet, who is not once mentioned in the course of M. T.'s long article.—Jan. 27.—H. Weil reviews Brambach's *Metrische Studien zu Sophokles*, and professes disagreement with the writer on sundry fundamental points. A notice by Ch. Thurot of Madvig's *Adversaria* presents a clear and useful summary of this great work of the great Danish scholar.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 43.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The next number will be published on Friday, March 15, and advertisements should be sent in by March 11.*

The Second Volume (October 1870 to December 1871) is now ready, bound in cloth, price 15s. Covers may be had of the Publishers, price 2s.

## Art and Archæology.

Correggio. Von Julius Meyer. Leipzig: Engelmann, 1871.

THERE is no painter of the sixteenth century whose life is so completely shrouded in obscurity, or whose character, personal appearance, and surroundings, are so little known, as Correggio. Correggio lived away from the centres of humanistic teaching—away from Florence and from Rome, where the classical in letters and in art was cultivated. He spent his years in a province into which præ-Christian influence in sculpture and architecture could hardly penetrate. He knew nothing of the early striving of the Tuscans for ideals of form and proportion, less still of the labours of the realists who startled the sixteenth century with subtleties of detail and texture. Confined to a small circle of country in which the hum of the world's business seemed comparatively hushed, he never came in contact with any of the great masters whose names were household words in the cottages and palaces of Italy. His pictures were not painted for the State nor for illustrious patrons; amongst local contemporaries none thought it worth their while to note Correggio's birth or death, or tell of his daily life, his friends, associates, or wellwishers. And yet Correggio ranks in the opinion of this and earlier generations as an artist of pre-eminent power, who, above all others of his age, transfigured homeliness into sublimity. It was Correggio who, at a period when sensualism and mannerism were on the increase, clung to the purity of nature, and depicted in its most delightful aspects the fond rapture of the mother, the mirth and glee of the child, and the eager devotion of a holy congregation. It was he who combined motion in its most daring forms with sprightliness and humour, who tempered light, and shade, and colour, to the most dazzling force and most harmonious balance. It was he who illustrated with unmatched power the true maxims of aerial perspective and chiaroscuro.

We deplore this contrast between the obscurity of the man's life and the brilliant attraction of his pictures the more as the result of it is to make a history of Correggio extremely difficult to write, forcing the biographer to oscillate between minute details in which probabilities in respect of small but relevant facts receive a dry but necessary attention, and descriptions of works in which previous sobriety is usually counterbalanced by an excess of colouring. If under such adverse circumstances as these Dr. Meyer has produced a book alike interesting, varied, and full of tone, it is much to his credit. There is no biography of Correggio that can be pointed to which contains so fully and exhaustively all that has been preserved and written of the master; none which

gives with more graceful picturesqueness an idea of his qualities and defects. With praiseworthy conscientiousness, the legends which have been told of Correggio's life and education are examined and reduced to their real value. The critical opinions of this and earlier generations in respect of his style are set before us; then comes such news as can be gathered directly or indirectly as to the painter's youth, his teachers, and those whose example was of influence in the expansion of his genius. Interesting chapters follow in which the frescoes and canvasses in Italy and elsewhere are described; and an essay at the close explains the character and significance of Correggio's art. Appended to this—the main body of the work—is a descriptive catalogue of all pieces genuine or not, of all drawings and engravings, under Correggio's name.

That in a field so vast and so closely sown with difficulties, criticism should not be able to find fault, was not to be expected; and Dr. Meyer's life of Correggio is not without conclusions to which we may demur, and not without statements requiring modification or correction. It may be well, however, to confine ourselves to a few salient points.

In the third chapter, which treats of Correggio's youth and education, countenance is given to theories which almost invite dispute. We are told that Mengs was probably right in thinking that Correggio had lessons from Francesco Bianchi Ferrari of Modena, because there are pictures by that artist in the galleries of Paris and Modena which bear the impress of an art similar to Correggio's in the Madonna of St. Francis at Dresden. Yet there are local masters of the school of Parma whose manner is more closely related to Correggio; and no one as yet has ventured to include them in the list of those who influenced Allegri. To start from such uncertain premisses, and build upon them as if they were sure foundations, is more than venturesome; for there is no better ground for thinking that Allegri wandered to Modena than there is for believing that he moved to Parma. We have to remember that Ferrari was an artist of very low power, who died in February 1510, when Correggio, on the most favourable computation, was barely sixteen years old; and, as regards Correggio himself, we know that he was residing in his native place as late as January 1511.

Greater force may be conceded to Dr. Meyer's view, accepted years ago by Pungileoni, that Correggio spent a certain portion of his youth in Mantua, where he acquired the taste for foreshortening and the style of architectural adornment peculiar to Mantegna; but it might also have been borne in mind that the principles of Mantegnesque art were widely diffused throughout the cities of the valley of the Po; that they were quite familiar to the Modenese through the medium of the Canozzi; that they were known to the Loschi, Mazzola, and Christophoro Caselli at Parma; and it might have been thought worthy of remark that Caselli's style, like Correggio's, was affected at different periods by Venetian and Paduan elements. In his early years a disciple of the Canozzi and Montagna, Caselli modified his manner by contact with Cima; and there is an altar-piece of 1499 bearing his name in Parma which gives us quite a foretaste of Correggio in the mould of the faces of angels, and the peculiar mild diffusion of twilight on flesh which characterizes Allegri's earlier productions. It is very probable that Dr. Meyer has underrated the importance of Parma as a place in which Correggio might study new forms of art. It was a city famous at the opening of the sixteenth century for the pictures which Cima painted there. These pictures were of a character to suggest to a young and rising artist the charms of polish, of balanced chiaroscuro and subdued silvery tone; and they might have led Correggio to acquire those delightful blended modulations of light and

shade which so many critics, including Dr. Meyer, ascribe to Leonardo. There are two artists of Central Italy in whom the influence of Da Vinci has been considered to have been markedly displayed; these are Correggio and Lotto; and yet no one can prove that they ever met or came in contact with Leonardo. Correggio and Lotto, it is interesting to observe, were alike in many respects. They were alike in their fondness for Leonardesque polish and finish; they had the same spirit in composing groups of gleeful angels, the same feeling for tenderness in the attitude and movement of saints, the same smiles and dimples, and similar ideas as to the application of the laws of light and shade. It is not to chance, we should think, that this coincidence is due; and it is not at all unlikely that Correggio at some period of his obscure career witnessed the striving of more than one Venetian craftsman to rise to mastery and eminence. We may believe that it will be possible to the future student of Correggio's life to lay down that Correggio was no stranger to Cima, to Palma, Lotto, and Pordenone; and critics may be invited to observe how many of the elements which make up Correggio's style are to be found in the works of all the Venetians above named.

In the effort to preserve a rigid chronology, Dr. Meyer is not always able to trust to his own observation; but finds it both convenient and necessary to call to his aid some brother critic upon whose opinions he carries up his own edifice of historical induction. It is, perhaps, needless to point out the danger of such a course as this. The fact is that it creates inequalities almost as startling at times as a later interpolation might be. Had Dr. Meyer seen the "Madonna with Saints" which so long adorned the collection of Bath House, he would perhaps have agreed with those who believe that "Madonna" to be a copy. He certainly would have paused before he assigned to a cold and ill-favoured picture the same date as the soft, and delicate, and supremely beautiful "Marriage of St. Catherine" at the Louvre.

Finally, Dr. Meyer may learn to distrust the sources from which *original* records are derived when he hears that the contract for the celebrated "Nativity" at Dresden which he prints is not derived from an original text, but from a copy of the original recently discovered in the archives of Modena.

CROWE-CAVALCASELLE.

### THE EXHIBITION OF PICTURES BY OLD MASTERS.

#### II.—ITALIAN, SPANISH, FLEMISH, AND DUTCH SCHOOLS.

WHETHER the so-called "sketch" of "La Gloria" (No. 114, contributed by the Duke of Cleveland) is actually by the hand of Titian is somewhat doubtful, but its intrinsic merit and the importance of the great masterpiece which it represents would in any case justify careful examination and discussion.

Titian's finished picture, now one of the chief treasures of the Madrid Gallery, is a great altar-piece about four times the size of the present example. The picture now being exhibited was, I believe, formerly in the collection of Mr. Rogers, the poet, and was sold at Christie and Manson's in 1856: in the sale catalogue it is stated to have been discovered in a gambling-house at Madrid, and to have been purchased by M. de Bourke, afterwards Danish minister in London. From M. de Bourke it passed through the hands of Wallis, a well-known dealer of the early part of this century, to Mr. Rogers. Probably no other world-renowned picture is really so little known to lovers of art as the masterpiece in question: the fact that the original picture was sent to Spain almost immediately after its execution in Venice accounts for the paucity of reproductions of it, whether as copies or engravings. It is true that a fine engraving of the composition was made by the Italo-Flemish engraver Cornelius Cort (in 1566, shortly after it was painted), but that engraving is scarce, and I am not aware that any other print exists. It would

of course be most interesting to compare the engraving, the present "sketch," and the original picture together, and as the latter has been recently photographed in Madrid, this is now substantially practicable; some instructive evidence would doubtless result; I have not however had time or opportunity to make this comparison with a view to my present task.

The work now in question is called a "sketch," and it is doubtless assumed to be a first study for the great picture, but it would perhaps be better to designate it by the convenient term "replica," for as far as my recollection of the finished picture serves me, the two are substantially identical both in composition and colour, which would scarcely be the case if this were really a preliminary design.

In determining this point the fact should be noted that it was not the custom of the Italian painters of Titian's time to make small preliminary sketches in colours: that practice seems to have arisen in another age and school; it was perhaps mainly stimulated and established by Rubens and Vandyck; but copies or sketches from pictures already completed, on a smaller scale and sometimes with variations of design arising from after-thought, were doubtless made at all times and in all schools, often by the authors of the original works themselves. The picture before us then may, I think, safely be deemed one of these after-copies or "repliche," but the important question as to when and by whom it was executed remains to be solved. That it is an excellent reproduction of the finished picture is certain, and there is nothing in the general "technique" inconsistent with the supposition that it is of contemporary date and either by Titian himself or some talented Italian scholar; but at the same time there is perhaps an equal probability that it may be the work of an able Spanish copyist of the sixteenth or seventeenth century; the best criterion, the evidence of the "touch" or "execution" of the painter—his handwriting, so to speak—can unfortunately no longer be relied on, for the surface of the picture has been too much defaced and obscured by the results of neglect and ill-judged "restoration."

We have at all events now before us a fair representation of one of the most celebrated historical pictures ever painted—yet "La Gloria" is not one of Titian's finest performances; it was a commissioned work, and the soul of genius always rebels against stipendiary employment; in reality this great picture may be taken as the first of a declining series of official productions successively executed by the great painter for the Emperor Charles V. and his son Philip II., under the terms of his service as court painter; many of these works are still preserved at Madrid, and one after another, in the order of their production, they clearly display the deadening aspiration, the failing powers, the indifference and carelessness of advancing age.

Still, in spite of many drawbacks and even absurdities, "La Gloria" is worthy of its title, whilst nothing can be more interesting than the facts of its production; there can be no doubt that it was ordered of Titian by Charles V. when he first resolved to abdicate and retire from the world; the subject of the picture in fact symbolises that retirement in a manner which is even crudely obvious. The emperor evidently wanted an altar-piece for the church of the monastery of Yuste, where he had determined to end his days, which should perpetuate the memory of his sojourn there.

How far Charles himself prescribed the exact subject and ordonnance of the work is uncertain; whether even this mighty and arrogant monarch would have directed his painter to represent himself and his deceased queen in Heaven, being presented to the Almighty Father by all saints and patriarchs in celestial court assembled to that end, much in the same manner as he would have caused any grandee and his consort to be presented to him in his own sublunary court, seems very doubtful. There were veins of melancholy sentiment, of poetry even, in the heart and mind of Charles which rather forbid the supposition that he himself prescribed to Titian the exact composition of this picture. Surely had he done so, the wife he had loved, and whose memory he cherished in his last days more dearly than ever, would have been seen amongst the blessed souls, eagerly rushing forward to welcome her earthly consort, not, as it is, kneeling in a secondary place behind him, as if both had made their advent in Paradise together. In truth, there is as little poetry as common sense in the design and arrangement of the work, and whoever is responsible for the conception—perhaps some Spanish friar—it is in reality one of those strange sprawl-

ing "sacre conversazioni" such as Correggio first depicted in his Parma frescos, rather to the amazement of his contemporaries, which Michel Angelo in some degree, nevertheless, repeated in his "Last Judgment," and which, at a later period, Tintoretto finally carried to the utmost limits of absurdity.

Ticozzi has shown that "La Gloria" was already completed in 1554, and Charles did not retire to Yuste till 1556; it is quite certain that the picture was fixed in its place during the emperor's lifetime; and it is on record that Philip II. after his father's death lost no time in bringing it back to Madrid, together with the entire museum of art-treasures with which the emperor had surrounded himself in his retreat. The important fact of the date of the work is thus ascertained with sufficient approximate certainty.

The subject of "La Gloria" in great measure dictated the scheme of colour and light and shade—it displays, in fact, a blaze of supernatural golden light, in which the numerous foreshortened figures are upheld and immersed as if in a sustaining medium; the local colours of flesh, draperies, and accessories being all alike vivified and illumined with a degree of splendour never before achieved, and perhaps never since surpassed by mortal pencil.

It was perhaps a concession to Spanish religious symbolism which led Titian to clothe the three divine personages in the upper part of the picture, in massive ultramarine blue draperies; as it is, both in the present "replica" and in the Madrid picture, these figures have become rather obtrusively prominent, "telling" somewhat too much as dark spots on the brilliant background; it must be borne in mind, however, that this discordance is mainly owing to the fading of the light warm tints of the background, whereas the ultramarine pigment, being absolutely unchangeable, has acquired greater relative force of tint.

It is well known that in after-time the Spanish church painters' guide, *El pintor erudito*, of Padre Ayala, prescribed this colour as the fittest emblem of the purity and holiness of the highest celestial beings. There is little doubt in any case that an entire cycle of Spanish religious pictures—the radiant blue-draped Madonnas, mounting to the skies, surrounded with angels and cherubs, the "Virgens de la Concepcion" of Alonso Cano, Velasquez, and Murillo—had in great measure their antetype and model in this particular picture of Titian.

It is a fortunate coincidence that the replica of "La Gloria" should have been exhibited on the same occasion with the "Europa" (No. 126), belonging to Sir Richard Wallace, for it is evident that the latter most exquisite picture was painted at about the same period of Titian's career, and in the same style and spirit.

There exists a larger picture of "Europa," by Titian, now in the possession of Lord Darnley, at Cobham, but formerly in the Orleans Collection. It was exhibited some years ago at the British Institution in Pall Mall. From my recollection of that picture I believe it to be a later work than the present, and it is painted in a much lower tone; in fact, a comparatively dark picture, like the "Diana and Actæon" in this exhibition, next to be described. The present most admirable treasure of art was purchased for the late Marquis of Hertford, at a sale at Christie's, some years ago, for a few hundred pounds only. It is another of those unique and priceless works which should have been acquired at any cost for the National Gallery, and which it is almost a crime in those concerned to have overlooked. I have a vivid recollection of having somewhere long ago seen a study from this very picture by the hand of Rubens—a rapidly executed black-chalk sketch on paper, but touched or slightly tinted in parts with colours—evidently added by Rubens as memoranda, the more certainly to impress on his mind the ineffable vision of glorious light and colour which entranced him.

Although not directly relevant to our present review, I may say that amongst the rich veins of that only half explored art-mine—Spain—an especially interesting one is the evidence of the influence which Titian's masterpieces in that country exercised on Rubens. The prince of Flemish painters bent the knee to the great Italian. Side by side at Madrid may be seen two pictures—and the critical student who has not yet seen them has still to profit by one of the most striking and instructive technical lessons in art; these are Titian's great picture of "Adam and Eve in Paradise" and Rubens' free copy of it, of the full size. Rubens is there seen as it were grafting himself on Titian, and

endeavouring to improve on his model. Titian perhaps would have lauded the result, but I am disposed to think that Rubens would have admitted his own failure!

(No. 73) "Diana and Actæon," contributed by Earl Brownlow. This is a fine representative picture of Titian's late period—a grand, massive, sombre work, full of poetic feeling, weak in some respects, yet in others most powerful—the production, as it were, of a waning giant. The great predominance of the picturesque landscape element in this picture, and the comparatively slight and careless drawing and execution of the figures, illustrate the tendency which seemed to grow on Titian with advancing years, to neglect and underrate the more severe characteristics of form or design in favour of what may perhaps be termed the emotional qualities of colour and artificial chiaroscuro.

Titian had undoubtedly a special bias towards landscape painting—he may, indeed, almost be deemed the creator of that art as a distinct branch. If the Royal Academicians could next year obtain Her Majesty's permission to exhibit the splendid Titian landscape in the Buckingham Palace Gallery, where it hangs half concealed in a dark corner, they would render a greater service than by displacing whole rows of pictures from Windsor or Hampton Court, where they can be seen by everybody just as well as at Burlington House. Furthermore, in passing, as we are about to concern ourselves with Velasquez, I recommend at the same time to their notice a superb portrait of the young prince of the Asturias, son of Philip IV., of whom more anon, one of the little known treasures of the same royal residence; the latter picture occupies a place in one of the lower rooms of the palace, and its existence even is unknown to the mass of lovers of art. The exhibition of these pictures, especially the former work, would be a great lesson and a powerful rebuke to the present generation of "pre-Raphaelite" painters. Such pictures, moreover, are the true antidote to the great bane of modern landscape art photography!

The "Diana and Actæon" belonged at one time to Christina, queen of Sweden, and it afterwards passed into the Orleans Gallery, which famous collection numbered upwards of twenty pictures of Titian. It was purchased at the sale of the Orleans pictures in London for 200*l.* by Sir Abraham Hume, who was the author of a *Life of Titian*.

Nearly all the Orleans Titians are doubtless still in this country, and to ascertain the present whereabouts of the several specimens, and to get them together again on some such occasion as the present, is just the kind of work which the public expects the Academy to take in hand.

I cannot quit the great Venetian masters without digressing again, to put on record the fate of another picture—a masterpiece mentioned by Vasari and most of the subsequent illustrators of the life and works of Titian. Besides the well known and beautiful little picture representing Christ appearing to Mary Magdalene in the garden after His resurrection, now in our own National Gallery, Titian painted a large picture of the same subject, the figures in which were of the size of life. This was done for Philip II., and a letter from the king to Titian respecting it is still extant, from which it appears that the work was finished and ready for delivery in 1561. That picture, though known to have been sent to Spain, has been long missing; in truth, alas! it has been destroyed, yet not entirely, for a fragment of it—the head of Our Saviour, cut out of the panel—still exists; and as a further compensation, a copy—though a very bad one—of the entire composition is also extant. These were brought to light again in Spain by myself, some years ago, and as an illustration of what may happen to the sublimest works of human genius, I will briefly relate the circumstances of their discovery.

On the occasion of a visit of exploration to the Escorial, I noticed the copy in question hanging exposed to the outer air in one of the interminable corridors of that vast edifice; a single glance sufficed to show me that it represented a picture by Titian—the lost work, in fact; but my delight was greater when, at the same time, I recognised in the head of the Saviour the copy of an original head by Titian, hanging in the gallery at Madrid. A close inspection of the latter immediately afterwards, at once revealed the fact that it was a fragment evidently cut out from a larger work. On communicating my discovery to the director of the gallery, that eminent and estimable person informed me that his father, and predecessor as

director, Don Pietro Madrazo, had himself many years before discovered and rescued this fragment from destruction at the Escorial, where it then served as the cover of a "tinaja"—or large oil jar—having been evidently treated by the monks as a piece of ordinary board!

From Titian to the Spanish school is a proper and orderly transition. The present gathering is not rich in Spanish pictures; but it comprises, nevertheless, several important works of the greatest masters of the school. It would be an interesting task to show more in detail the direct influence which Titian undoubtedly exercised on Velasquez, Alonso Cano, and Murillo; time and space, however, are not sufficient for the purpose, and it must suffice to indicate the fact, to which, moreover, I have already alluded, that the royal collections at the Escorial and at Madrid were the chief sources of instruction, and contained the great precedents which mainly contributed to form the style of those pre-eminently national and untravelled painters, and that Titian was undoubtedly their principal model.

Josef Ribera, called Il Spagnoletto, comes first in order. The works of this master are so numerous and so well known that I should not have noticed the one capital picture by him in this exhibition (No. 97), the property of Mr. T. Baring, M.P., were it not that it is a somewhat exceptional work. Ribera carried out and continued to another generation the technical processes and very characteristic style of his Italian master, Michel Angelo da Caravaggio, and everybody is familiar with his dark, powerfully painted pictures. Here, however, we have a lightsome silvery picture, and at first glance it might rather be taken for the work of a celebrated Bolognese contemporary, Guido Reni, than of Spagnoletto. There can be little doubt, in fact, that the picture was executed in direct imitation of the new manner of the former artist. Guido was born thirteen years earlier than Ribera, and he had, at an earlier period than the latter, adopted the dark, violent manner of Caravaggio, but he afterwards abandoned the dark style, and painted in a manner in many respects entirely contrary—one, in fact, eminently clear, light, and "silvery."

This phase, then, seems to have exercised a passing attraction on Ribera; but it could only have been a temporary influence, for his lightsome pictures are very few in number, and they were probably executed early in the career of the master, and it would seem that he relapsed again into his original sombre style, and ever after continued faithful to it.

Velasquez, on the other hand, upon whose early essays both Caravaggio and his countryman Ribera exercised a strong influence, began as one of the "Neri," or dark painters, but steadily, with advancing powers, emancipated himself from it, adopting instead, like Guido, a clear and lightsome manner, which increased in brilliancy and vivacity to the last. There are two important works of the king of Spanish painters, Don Diego Velasquez y Silva, in the exhibition, both contributed by Sir Richard Wallace: No. 142, absurdly called in the catalogue "*Portrait of the Infanta*," and No. 75, equally stupidly entitled "*A Spanish Infanta*." Now the first of these pictures is a portrait of the "*Infante*" Don Balthazar Carlos, prince of the Asturias, son of Philip IV., when about a year and a half old, and the last-named is that of an unknown Spanish lady. Velasquez painted the young prince over and over again; there is, indeed, perhaps no better known historical portrait than that of this child, who died at an early age. It must be clear to everybody that the picture represents a boy, and not a girl. As regards the other picture, the different members of the royal family of Spain during the life of Velasquez were so few in number, and their portraits so well known, that there would not have been the slightest difficulty in identifying the lady if she had really been an Infanta of Spain—that is, a member of the reigning house.

The latter portrait is that of a good-looking Spanish lady of mature age, and doubtless of noble birth: she has no resemblance to either of the wives of Philip IV., and there is not the slightest trace of the family likeness stamped so unmistakably on the face of every descendant of Charles V. Not, however, that the Academicians who made the catalogue troubled themselves in any way about this matter; it is clear that they were utterly ignorant, careless, and indifferent—ignorant alike of any tincture of knowledge of languages, or they would have known that an *infanta* meant a female, not a male, personage; of the history of Spain, and of the career and works of Velasquez in particular. This is really too full a measure of ignorance in the

members of an Academy which, if I mistake not, numbers a secretary for foreign correspondence and a professor of history amongst its officials!

As regards the portrait of the little "*infante*," the child is evidently only just able to stand alone; it may thus perhaps be the picture alluded to by Sir William Stirling Maxwell, in his *Life of Velasquez*, as the first work which the painter executed after his return from Italy in 1631, the young prince having been born during his absence of about a year and a half.

The picture is somewhat darker than the other works of this particular period of Velasquez, and the influence of Ribera, especially in the "handling" of portions of the work, is still perceptible, but the admirably facile yet most truthful execution pertaining to Velasquez alone—that power of expressing, with a few magical touches and loose strokes of the brush, delicate and refined passages of form and texture, to the rendering of which other painters would have patiently devoted hours or even days of labour is yet everywhere visible.

The portrait (No. 142), also the property of Sir Richard Wallace, that of a thoroughly typical Andalusian lady—"petite," short of stature, not beautiful, but yet graceful and attractive—has been for years confounded in my mind with real, living, individuals of her race. To my imagination she is the same lady who sat next to me at the first bull-fight I witnessed in Spain, when the gentle, regular waftings of that very fan never ceased or varied all the time, whilst I hid my face, and dared not look at the cruel horrors going on before me. Again how often have I seen her with that very rosary at early mass. The clear, rose-tinted complexion of this lady suggests to my mind that she must have been a Granadine belle; however, there is absolutely nothing known about her, but that she lived and died, and had the good fortune to have been painted by Velasquez.

The picture came from the collection of the Spanish banker, the Marquis Aguado, sold in Paris twenty or thirty years ago, and it is well known by more than one engraving executed from it. It was probably painted some years after the other picture.

There is but one important work of Murillo in the present exhibition (No. 98), the "*Charity of Saint Tomas of Villanueva*," contributed by Sir Richard Wallace. Murillo painted many pictures representing the actions of this local saint of the Seville district, and they are amongst the most interesting and beautiful of his productions. They afforded scope for the portrayal of the men and women of Spain as they existed around him, and as the present generation still live, but little changed—the peasants and beggars, clad in the universal "pafio pardo" of russet-tinted Spain; the idle melon-munching "*muchachos*" of the streets; the half-naked children; the women with lustrous eyes gleaming beneath their dark mantillas; the dark, smooth-cropped priests. At an hour's notice any time the streets of Seville would still furnish materials for a *tableau vivant* the very counterpart of this fine picture.

This work belongs to the mature period of Murillo, when he painted firmly and solidly, with a practised hand and with perfect mastery of all technical resources. Those who are acquainted with the entire cycle of his works, and especially with his pictures at Seville, will discern in it traces of the external influences which still exercised lingering sway over this most national and original painter; reminiscences of Velasquez, Vandyck, and Pedro de Moya; but the mass of picture-lovers will see in it only the pure genius of Murillo. This picture is, indeed, an excellent typical example of its class and period, which was that of transition from the earlier dark manner of the master to that of his ultimate characteristic style. It offers, however, few evidences of the "*estilo vaporoso*," or of the colours blended with "*leche y sangre*" which have always been the delight of the art amateurs of his own country.

No. 104, "*Moses in the Bulrushes*," according to the catalogue ascribed to Murillo, and the property of the Duke of Devonshire, has nothing whatever to do with the great Spanish painter, nor indeed with any other Spanish master. It is, on the other hand, evidently an Italian picture of the second half of the seventeenth century, and although an excellent work of art, not with certainty to be ascribed to any particular master. I have an impression that it may possibly be the work of Andrea Sacchi; it is at all events clear that the authorship has always been considered rather uncertain, for there exists a last-century engraving of the picture in which it is ascribed to Vandyck;

it is, however, as little like the work of Vandyck as that of Murillo.

No. 93, by Francisco Zurbaran, is a good example of a limited special class of subjects within which a second-rate master almost achieved real excellence. This picture, which has the interesting peculiarity of being fully signed and dated (1639), was one of the pictures collected in Spain by Baron Taylor for King Louis-Philippe, and which during his reign formed the "Spanish Gallery" of the Louvre. It was there a "pendant" to the very similar but superior picture now in the National Gallery; both were purchased at the sale of Louis-Philippe's pictures at Christie and Manson's.

The Flemish and Dutch pictures form the great bulk of the present exhibition, and there are many admirable works which well deserve careful note and description, but time and space will only allow me to make a few hasty and discursive allusions. Amongst the greatest masters, Cuyt, usually so well represented in this country, is less so this year than on the two previous occasions; there is, perhaps, no really first-rate specimen—the large "Landscape with Bridge, Figures, and Cattle" (No. 157), contributed by Mr. Bond, though certainly an important specimen verging on the best period of the master, is somewhat eclipsed by the larger repetition of the same composition in the collection of the Marquis of Bute. Rembrandt also does not dominate so powerfully this year, yet the two large pictures, portraits of "Jan Palekan (?) and his Wife and Children" (Nos. 90 and 101), are very important as specimens of the style and "technique" of the early period of the great master. What can possibly have moved the managers of the exhibition to exhibit the flagrant copy (No. 68—portrait of an old woman called Rembrandt's mother), belonging to the Earl of Hopetown, passes comprehension; the well known and most certain original of that picture hangs in the National Gallery. It was, indeed, rumoured in art-circles, at the time of the purchase of the latter from Lady Eastlake, three or four years ago, that a well-known member of the Royal Academy disputed the fact of its genuineness, maintaining that Lord Hopetown's picture was the real and veritable original; it is to be hoped, now at all events, that the authority in question has recognised the fact that the late president of the Royal Academy knew more about ancient pictures than he does. In all probability the copy now being exhibited was executed during the period when the National Gallery picture was in the collection of Mr. Wells, of Redleaf.

There are several admirable works by Vandyck, the two most admirable portraits of Philippe Le Roy and his wife (Nos. 134 and 128), contributed by Sir Richard Wallace, which in the first edition of the Academy catalogue were ridiculously described as the portraits of "Philippe le Roi," and portrait of "the Queen of Philippe le Roi," are too well known to need further illustration. A really important contribution has been made by the Earl of Hopetown in the admirable portrait of the Archduchess Isabella Clara Eugenia, Governess of the Netherlands in her widowhood (No. 64).

With the exception of the two glorious landscapes by Rubens the "Rainbow Landscape" (No. 125, Sir Richard Wallace), and No. 195, "The Watering-place," lent by the Duke of Buccleuch, the great Flemish master is weakly represented.

The beautiful portrait, ascribed to Rubens (No. 59, belonging to Earl Brownlow), is most certainly a fine work of Vandyck, executed shortly before he came to England.

One of those services which the Academy should specially endeavour to render is exemplified in the having obtained for exhibition the series of admirable Dutch and Flemish pictures belonging to Mrs. Charles Cope—this most welcome "envoi" is a striking instance of the wealth of this country in works of art of the very highest class, all but unknown to the majority of lovers of art. Probably no finer or more precious work of the master exists than the exquisite "François Mieris" (No. 194) or the "Jan Steen" (No. 197). Two other notable pictures from the same source, works of exceptional excellence, though by masters of secondary rank, are the "Asselyn" (No. 65) and the "Van der Meulen" (No. 84).

Mr. T. Baring's beautiful picture ascribed to Job Berkheyden (No. 177) is a treasure unequalled in its speciality. The owner, however, must have overlooked the fact that the picture is in reality signed by Gerard Berkheyden. It was doubtless mainly painted by the latter, but in all likelihood the beautiful figures were introduced by the other and more talented brother.

I have space for only one more notice; it is that of the portrait, by Holbein (No. 32), belonging to Mr. Millais, R.A. If the pictures contributed to the present exhibition by Mr. Millais' colleagues in the Academy had all been as genuine and as important as this, the best thanks of the public would have been due to them, but as it is, some of the most worthless things in the collection have been contributed by them.

Mr. Millais' picture attracted much attention at the recent Holbein exhibition at Dresden, and it is unquestionably an authentic, well-preserved, and important work of the master—all the more interesting inasmuch as it has only recently been brought to light. J. C. ROBINSON.

### THE TEMPLE OF DIANA AT EPHEBUS.

SINCE the notice of Mr. Wood's discoveries in the *Academy*, vol. ii. p. 370, considerable progress has been made by him in clearing the site of the temple. He recommenced his excavations at the end of September last, the earliest period when work could be resumed with safety on a site so subject in the summer months to malaria fever. Mr. Wood calculates that at the beginning of this month he had cleared about one-third of the whole area of the temple. The depth of soil over the site is upwards of twenty feet, so that the excavation will necessarily be a long and costly undertaking. Mr. Wood thinks that he has traced part of the line of the inner row of columns and *cella* wall on the south side, and there seems to be ground for believing that the intercolumniations of this row were 17 feet. Until, however, a much larger area has been cleared, and the water, which now in the winter months rises to four feet at the bottom of the excavation, has been drained off, no exact knowledge of the plan of the temple can be obtained.

The architectural marbles found up the present date consist of portions of bases of columns, portions of capitals, and many drums. The cornice and architrave have nearly disappeared, and as yet there is no trace of a frieze either plain or sculptured. Pliny, as is well known, asserts that 36 out of the 127 columns of the temple were *calata*, "sculptured in relief," a statement which has been a needless stumbling-block to commentators. Mr. Wood has discovered fragments of several drums from these *calata columnæ*, and portions of pilasters, also sculptured in relief. Of these the most important is a drum next the base, on one side of which the figures in relief are very well preserved; on the other side the relief has been completely broken away, probably by the great weight of this drum (upwards of eleven tons) when it was overthrown.

The figures still preserved on this drum consist of a group of male and female figures, probably Olympic deities. A naked male figure, with the *petasus* hanging from his back, the *chlamys* twisted round his left arm, and a *caduceus* in his hand, is clearly Hermes. He stands looking up as if addressing or listening to a female figure who stands in front of him. Her drapery, a talaric *chiton* and *peplos*, would be suitable for either Hera or Demeter. Her head is unfortunately broken away. On the left of this female figure is a naked female figure, winged, and girt with a sword, who can hardly be other than Victory. On the right of these figures, *i.e.* behind Hermes, is a group of a draped female figure standing, her head broken away, at her side is the lower half of a draped figure seated, which appears to be male. The standing figures in this composition are six feet high; the sculpture varies in projection, but may be termed high relief. The composition of the draperies is good, but wanting in originality; the figure of Hermes rather too naturalistic, with a want of refinement in the modelling and somewhat ignoble in the *pose*. The same remarks apply to the Victory; and the shortcomings in the anatomy and general carelessness in the execution of both these figures remind us of similar defects in the treatment of figures on the coins of the Seleucidæ and other kings of the Macedonian period. If, however, regarded as *sculpture*, these reliefs will not bear the test of the highest standard of criticism; they appear to be admirably calculated for their purpose as *architectural decorations*. If, as there seems reason to believe, every drum of the 36 *calata columnæ* was adorned with reliefs, and if these columns were 60 feet high, a richness of effect unexampled in Greek architecture must have been attained, which Phidias might perhaps have pronounced barbaric, but which was in harmony with the Oriental tendency and exaggerated proportions and gorgeousness of ornament which characterized

the Greek art of the Macedonian period. Fragments of reliefs on pilasters, corresponding in proportions with those of the drums of columns, have also been found, but it is as well to reserve the description of these till they arrive in England, with the rest of the cargo of marbles shipped by Mr. Wood on board H.M.S. *Caledonia* last month. This cargo will probably be sent on from Malta very shortly.

The architecture of the temple of Diana is, as might have been expected, Ionic, and very similar in character to that of the Temple of Apollo at Branchidæ, which was probably of the same date. With the exception of the fragments of *calate columnæ* and pilasters, no sculptures have been found on the actual site of the temple except such very small fragments as to lead us to fear that the Byzantine Christians, who evidently used the temple as a quarry, smashed up its statues with an iconoclastic thoroughness which left nothing for subsequent barbarians to destroy.

C. T. NEWTON.

### THE ORATORIO CONCERTS.

IT was pleasant to find the "Oratorio Concerts," after so long an interval, again proclaiming their *raison d'être* by such a performance as that of Bach's *Passionsmusik* on February 20; in the presence, too, of so large and sympathetic an auditory. The inevitable imperfection of the earlier performance of this work in England—inevitable not so much from its absolute difficulty as from the novelty or strangeness of its style to English musicians—might have postponed for an indefinite period the ultimate acceptance of one of inferior order. On the *Passionsmusik* the effect of these essays has been altogether different. The attention of thoughtful students has been continually directed towards it. Favoured by the recent accessibility of copies, singers and players whose consideration formerly was limited to their own "parts" have learned to know the work as a whole; and hearers, like performers, in becoming familiar with, have become reconciled to much in it that once seemed to them ugly or uncouth. Nothing seems now wanting but more frequent hearing to give *The Passion* of Bach a place in the hearts of the English people beside that of *The Messiah* of Handel.

Mr. Joseph Barnby, following in the track opened out by Sir W. Sterndale Bennett, has certainly done his utmost to bring this about. The performance on the 20th ult., under his direction, was incomparably the best that has yet been given in England—a performance (the first of which this could fairly be said) correct as well as hearty enough to have enabled an intelligent amateur, hearing the work for the first time, to form a fair estimate of its merits. The principal solo parts were assigned to Madame Cora de Wilhorst, Miss Julia Elton, Mr. Edward Lloyd, and Herr Stockhausen. To the ladies may be awarded the credit of good intention and careful study; to the gentlemen something—indeed, much—more. Mr. Lloyd sustained his arduous part, consisting almost exclusively of recitative and *aria parlante*, bristling with difficulties physical and musical, with words which *must* be spoken, on notes at the top of the voice, separated by intervals often the most ungainly and unexpected,—most admirably. Herr Stockhausen is never heard to such advantage as in sacred music of the highest class, on the interpretation of which he brings to bear vocal aptitude increased and refined by careful training, an acquaintance both extensive and close with music of every epoch, nation, and quality, and general culture not common among those of his absorbing profession. The highest and rarest quality of an interpreter is just expression, impossible without deep and intense feeling. The depth and intensity of Herr Stockhausen's are in no way so clearly proved as in the reticence by which he governs its expression on the greatest occasions. Those who remember—none who heard it can have forgotten—his delivery of the only one of the Divine Sufferer's last utterances with which Bach has ventured to deal, will thoroughly appreciate my meaning.

In comparison with the enormous mechanical difficulties with which the performance of such contemporary music is accompanied, those of the *Passionsmusik* might not seem to demand special consideration; on the contrary, though of a different kind, they are still considerable. Both the instrumental and vocal parts are deficient in that form, the boldness and symmetry of which so greatly facilitate the realisation of most modern music, and even of the music of many of Bach's predecessors as

well as contemporaries. It can never be argued from one of his passages what the next will be, or even from the beginning of a passage how it will end. Their execution, therefore—their *reading* at least—demands, if not a great, an unintermittent strain on the executant's attention. For the first time in my recollection, band and chorus, under Mr. Barnby's latest guidance, trod the intricate mazes which the ruthless old John Sebastian had prescribed for them, not merely with unswerving, but apparently unhesitating, feet.

Having said thus much, I will touch on two or three matters in which I think their performance might have been better. In the first chorus, "Come, ye daughters," the chorale, "O thou begotten Son of God," was, even with one's eye on the notes of it in the score, nearly inaudible. As Mr. Macfarren has shown in his admirable essay prefixed to Messrs. Novello's edition of *The Passion*, this and other melodies incorporated in Bach's works were, and indeed still are, familiar to the people of Germany; and there can be no doubt that the great composer calculated on the congregations who might "assist" at their presentation lending their voices to add to the intensity of these melodies. Congregational singing all the world over is and always has been *in octaves*; men and women uttering in their natural registers the same progressions in the same key. It is to be hoped, therefore, that in the next performance of *The Passion*, Mr. Barnby, or it may be Mr. Done—for the work, I rejoice to hear, is to be performed at the next Worcester Festival—will not be withheld by any pedantic or superstitious veneration for Bach's score from carrying out Bach's very obvious *intention*, even if need be in some new way; either by reinforcing the sopranos to whom the chorale is assigned by as many tenors, or by brass instruments. Perhaps both might be employed with good effect. Having counselled one seeming innovation, I have to protest against a real one—the singing by Mr. Barnby's choir of the chorales without accompaniment, and indeed the altogether too sparing use of "the sacred organ" throughout his performance of the work. It is needless in this case to call into court tradition, whose evidence would be irrefragable. That of the score is still more emphatic. To every chorale in the Leipzig edition express directions are attached concerning the instruments by which the several parts of it are to be accompanied: "viol<sup>a</sup> 1<sup>ma</sup> col sop<sup>ra</sup> 1<sup>ma</sup>," and the like. Moreover the *basses* are, throughout the work, *figured*; and figures added to *basses*, it need not be said, represent notes. Why are *these* notes omitted in performance rather than any others? Mr. Barnby can hardly be moved to their omission by the small desire to show how cleverly his choir can do without them. Nor can he think that Art is served by turning these Titanic expressions of the most tremendous event in history into pretty part songs. The final gradations, the obstreperous fortes, and the all but inaudible pianos, for the exhibition of which the organ is mute during these chorales, are of themselves heresies unknown to ancient practice; in any case they are altogether out of place in the rendering of these austere products of the country of great organs and great organists.

The work under Mr. Barnby's direction is considerably curtailed. This is inevitable: as a whole, its performance—with all the "da capos"—would as certainly exhaust the patience of the most enthusiastic auditor as of the most untiring performer. Probably, however this curtailment may be made, somebody will miss something he would willingly have retained. Perhaps on another occasion Mr. Barnby will feel encouraged to restore a few of the excised numbers. Or how would it do to perform each part entire on two separate and not distant occasions? The *Weihnachts-Oratorium* is designed for performance on six different occasions. Anyhow, the occasional presentation of such a work is a thing to be grateful for, and a thing the possibility of which, a quarter of a century ago, would never have entered the mind of its great author's most enthusiastic worshipper.

JOHN HULLAH.

### NOTES ON ART AND LITERATURE.

Professor Liebrecht writes to us to say that the opinion which he expressed in the *Academy*, vol. ii. p. 279, concerning Simrock's translation of *Midsummer Night's Dream* by *Walpurgisnachtstraum* was not intended to be final, and

communicates the following summary of the objections which have been made to it:—

"In *Midsummer Night's Dream* mention is made of a May-day festival just over, which cannot be reconciled with the title or the remainder of the play. Kurz, the principal opponent of Simrock, attempted two years ago to explain the contradiction in the *Shakespeare-Jahrbuch*; but whatever view is taken of the question, the allusion to the 'observance' is only incidental, and cannot be relied upon as fixing the date positively and precisely, while in all the rest of the play a different time of year is certainly supposed. Thus Titania says to Oberon:—

"And never, since the middle summer's spring,  
Met we  
But with thy brawls thou hast disturbed our sport."

Midsummer nights therefore are the season for elfin revels, and the title is in complete correspondence with Titania's words.

"The objection that the title, *Midsummer Night's Dream*, may be spurious is met by Meres, who gives it, so to say, as the official designation in his catalogue of Shakespeare's works; and another suggestion, that Shakespeare may have written *Summer Night's Dream*, and included May in the summer, is equally untenable, for, like the Germans, Shakespeare and his contemporaries had long laid aside the old Teutonic division of the year into two seasons, and 'mayings' and 'summerings' were kept even superfluously distinct. In short, there is but one single passage in the play where the season is May, everywhere else it is Midsummer; the one is a passing allusion, and the other is essential and lasts throughout the whole piece.

"But again, even supposing, what is not conceded, that May-night is the time of the play, it still should not be looked upon as *Walpurgisnacht*, for the English maying and the German witches' sabbath are two distinct and in their form diametrically opposite traditions, which must not be confounded. Shakespeare had no conception of a *Walpurgisnacht*. It is only since Goethe that the idea has been common property in Germany: and to credit the great poet with a conception quite foreign to his mind is a serious falsification of literary truth. To the objection, 'We translate for Germans, not for Shakespeare,' it may be answered that Germans have a right to the genuine Shakespeare, who knew nothing about *Walpurgisnacht*; otherwise we might have a translation of Homer in which Troy is bombarded with cannon."

Don Andrea Caravita recently completed his valuable book of reference on the codices and treasures of art in the abbey of Montecassino. With the publication of a third and final volume he carries the history of his monastery to the opening of the present century. An interesting MS. fragment describes the sack of Montecassino by the French, and the narrative, from the pen of an eye-witness, reads curiously enough at a time when the French are complaining of the plundering which the Germans are said to have carried on in France. The most valuable contributions which the book contains are, however, excerpts from accounts and papers illustrating the lives of Andrea da Salerno, Marco Pini of Sienna, Francesco and Leandro Bassano, Antonio and Francesco da San Gallo, Marliano da Nola, Solosmeo, and other artists of less note.

It has been hitherto believed that Andrea da Salerno, after studying under Raphael, retired to Naples, where he died in 1545. The Montecassino records give notices of the works which Andrea executed between 1518 and 1530 in the choir and two chapels of the monastery; they comprise a will drawn up at Gaeta a few days before the painter's death. Andrea resided habitually at Gaeta, where he produced several pictures. He was buried there in 1530 in the church of Sant' Angelo Palanzano.

Marco Pini is well known as a pupil of Beccafumi, who wandered from Sienna to Rome in 1549, and, passing south, founded a pseudo-Michaelangellesque school of art in Naples. The contract in which he agreed to paint the whole of the crypt-church of St. Benedict at Montecassino is dated 1557-8.

Travellers may still see in the refectory of the abbey a large picture, twenty-seven feet long by eighteen feet in height, representing the charity of St. Benedict. On a corner of the canvas are the words: "Leander Bassano fecit." This colossal piece was unknown to Ridolfi, and escaped the attention of Lanzi, though it was noticed in the chronicles of Gattola and Tosti. It was re-discovered, so to speak, in 1863, by M. de la Fage, who printed the records referring to it in his *Essais de Diphthérogaphie musicale*. The curious fact which the documents republished by Caravita reveals is that the canvas was ordered in 1591 of Francesco Bassano, and left unfinished at his death in 1592. But a new agreement was made with Leandro, who

finished and delivered the work in 1593. But Leandro had no more right to sign his name where we find it than Giovanni Bellini would have had to sign Gentile Bellini's "Sermon of St. Mark" at the Brera.

For the first time we have a distinct account of the share which the San Galli and others had in the celebrated tomb of Piero de' Medici at Montecassino. It is well known that Piero had been appointed governor of the Cassinese estates by Louis XII., and that he successfully defended the abbey against the Spaniards. When the French star was on the wane, Piero tried to escape into the fortress of Gaeta, but he was lost in a storm at sea, and his remains after recovery were placed in a vault at Montecassino. It was not till Clement VII. received the tiara that any attempt was made to do honour to Piero's memory. Caravita's documents show that the mausoleum was planned by Antonio da San Gallo, executed by Solosmeo and other Florentines, and adorned with statues by Francesco da San Gallo. The first stone was laid in 1531, and the whole structure was finished, after many delays, in 1546, but the inscription was only carved in 1552, and the translation of Piero's remains only took place in 1559.

At no great distance from this mausoleum is the tomb of Guido Fieramosca, respecting which we ascertain that it was designed by Giovanni Marliano da Nola, who contracted for it in 1535, the carvers being Solosmeo, Giovanni Francesco di Chimento, and Lorenzo il Fancelo. C.-C.

In the *Allgemeine Zeitung* for February 15, Julian Schmidt discusses, *à propos* of Hermann Grimm, the question whether contemporary artists ought to be criticized in their lifetime. He answers in the affirmative as regards all varieties of art and literature, and proceeds to characterize Grimm's *Essays on Modern Art* with a good deal of justice and discrimination, but the article is chiefly remarkable as an illustration of the endlessness of literary criticism when once criticism is recognised as a branch of literature. Hermann Grimm is an art-critic, and Schmidt's critique upon him would be fair matter for fresh criticism unless we decide that only original and independent contributions to art and literature should be criticized while their authors are alive, in which case only here and there an immortal critic like Lessing would live to be judged at all.

A. Gaedeke communicates to *Im Neuen Reich* (February 2) some unpublished letters from the Austrian minister in England at the time of Peter the Great's visit to this country in 1698. They confirm the report that the czar sat to Sir Godfrey Kneller for his portrait, and agree with other contemporary notices in failing to see in him much more than a barbarian with an extravagant taste for shipbuilding.

A curious discovery of buried treasures was made some days ago at Benevento by a mason who was removing the foundations of an old wall. His pickaxe struck upon a large pot, and on putting in his hand he found it full of freshly stamped gold coins. They proved to belong to the time of Manfred, and bear on one side his escutcheon, on the other the Suabian eagle.

The *Revue des Deux Mondes* (February 15) is enlivened by a *Proverbe* from George Sand; the dialogue has the lively dramatic neatness of which the French stage possesses and retains the secret, but it is a pity that the author, like most of her countrymen, seems unable to bring this remarkable and admirable technical dexterity to bear upon any other subject than the "to be or not to be" of a criminal intrigue; in this case the latter alternative is however preferred.

Towards the end of last year the *Anzeiger für Kunde der deutschen Vorzeit* published some extracts from a newly discovered Middle-Dutch poem on the Trojan War, which a writer in the *Allgemeine Zeitung* (February 13) proceeds to assign to Maerlant, the author of the *Spiegelhistoriael* and other works well known in the history of Dutch literature of the thirteenth century. The manuscript was found in the library of Graf v. Loë in Wissen-Weeze, and contains about 38,400 lines, though the end appears to be wanting. Its authorship is plain from a passage

which also establishes the identity of the "Jacob de Coster van Merlant," mentioned in the famous "boec van Merline," with the well-known poet Maerlant, who was therefore probably sexton of Maerlant, near Brielle. The romance of *Torec*, which has hitherto passed for an anonymous work, is, by a plausible emendation, restored to the same writer. Two other poems, one on dreams and the other on precious stones, are mentioned by name, and may perhaps be discovered hereafter, but the *History of Troy* is in any case an interesting and important work.

### Theology.

- The Greek New Testament, edited from Ancient Authorities, with the Latin Version of Jerome from the Codex Amiatinus. By S. P. Tregelles, LL.D. Matthew to Philemon. Bagster and Sons, 1870.
- Novum Testamentum Græce. Ad antiquissimos testes denuo recensuit, apparatus criticum omni studio perfectum apposuit, etc. C. Tischendorf. Ed. octava critica major. Vols. I. II. fasc. I. Lipsiae: Giescke et Devrient, 1869, 1870.

A JOINT notice of these two editions of the New Testament is amply justified, as well by the similarity of their form and object, as by the common relation in which they stand to the labours of Lachmann. Assuming, as we may fairly do, that the careers of Tregelles and Tischendorf are well known to our readers, the first question which arises is obviously this, What are their respective principles of textual criticism? In the case of Tregelles, we are referred by himself to his *Account of the Printed Text of the Greek New Testament*, &c. (Bagster, 1859), and his *Introduction to the Textual Criticism of the New Testament* (Longmans, 1856). We regret that we have only had access to the latter of these works, but the remarks it contains on the character, &c. of manuscripts (pp. 24-389) are among the best which have been written, and confirm us in the earnest hope that the author may soon be well enough to bring out the prolegomena together with the small remaining portion of the text. A just admiration is expressed (p. 134 *sqq.*) for Lachmann, who is ably defended by Tregelles against many objections and misconceptions. At the same time the two notorious defects of Lachmann's edition are clearly brought out, viz. that the authorities cited are too few in number, and that the Greek MSS. were but imperfectly collated by Philip Buttmann. Three (*i.e.* B, C, D) out of Lachmann's four primary documents (A, B, C, witnesses for the East;

D, for the West) were, as Tischendorf has shown (*Novum Testamentum Græce*, 7th edit. p. cix *sqq.*), not as yet properly edited. Both defects have been carefully avoided by Tregelles, whose authorities are at once more abundant than Lachmann's, and have been most scrupulously edited and collated by himself or by Tischendorf; in rare instances by others.

The object of Dr. Tregelles' edition is thus described by himself in the Introductory Notice:—

"To give the text of the New Testament on the authority of the ancient witnesses, MSS. and versions, with the aid of the earlier citations, so as to present as far as possible the text best attested in the earlier centuries; to follow certain proofs, when obtainable, which carry us as near as possible to the apostolic age."

This too was the aim of Lachmann, but is hardly in accordance with the words of Tregelles, which occur soon afterwards: "The object of textual criticism is the ascertainment, on grounds of evidence, of what the sacred authors actually wrote." For it is clear that the best attested is not necessarily the original reading, and Lachmann therefore drew a distinction between his diplomatic criticism, which is simply concerned with the best accredited text, and the function of exegesis, which has to restore the original text itself, and which he, as a mere philologist, modestly forbore to exercise. Tregelles, indeed, probably means chiefly that the actual words of the sacred authors are much more traceable in the earlier than in the later MSS., but his hesitation between the method customary among historians and practised even by Griesbach, of at once inferring the original reading, and the purely diplomatic method of Lachmann, cannot be mistaken. The difficulty of keeping criticism objective increases with the growth of the critical material, and the extension of the limits of textual evidence. Even Dr. Tregelles has not entirely succeeded in overcoming this. It is true that exegetical propriety finds no place among his criteria of a good reading, an omission doubtless dictated by the consideration that a reference to exegesis would interfere with a criticism which is essentially diplomatic. And yet his critical decisions are not always uninfluenced by internal evidences, of which no account is given in the notes below the text, and which we must therefore read "between the lines." This is clear from the examples given in the *Introduction* (p. 345 *sqq.*), where the critical evidence on the sections Matt. i. 18-25, xiv. 22-xv. 11, 1 John v. 7, is accompanied by a very explicit commentary. We are far from censuring severely this modification of theory by practice, and will only add that the critical rules stated in the preface to Part I., and at greater length in the *Introduction* (p. 343 *sqq.*), are well deserving of attention.

We now turn to the eighth edition of the *New Testament* by Tischendorf; the seventh has been already noticed elsewhere.\* Very large additions have again been made to the critical apparatus, chief among which is the Cod. Sinaiticus. Without prejudice even to a Tregelles, we may venture to say that the material supplied by Tischendorf is marked by equal exactness, and is much more copious. Among other points of superiority is this, that Tischendorf has employed a greater number of cursives than Tregelles, who has contented himself with adducing a few important specimens, and that he has also mentioned how many of these support any particular reading. But, as we said before, this copiousness of material does but increase the difficulty of constituting the text, and this explains the charge, brought by

\* See the present writer's review in *Studien u. Kritiken*, 1861, where Tischendorf's principles are compared with those of Lachmann, and his dissertation on "The Sinaitic MS. of the Bible with Reference to its Publication by Dr. Tischendorf" (*Stud. u. Krit.* 1864), where too an attempt is made to estimate the value of its text with especial reference to manuscripts A, B, C.

Tregelles (*Introduction*, p. 137 sqq.) against Tischendorf, of instability in his critical principles. Tregelles, too, has investigated the quality and value of his authorities more than Tischendorf has found opportunity to do, and on the basis of this investigation (*ibid.* p. 106) has undertaken, at any rate for the Gospels, to group the uncial MSS. according to their quality and affinity. The duty of also determining the quality of our critical authorities in the main from an exegetical point of view has been, to the best of his ability, fulfilled by the present writer, not only in the places referred to in the note, but in his *Commentary on the Epistle of Paul to the Galatians* (see the Excursus on Textual Criticism, p. 601 sqq.).

We may hope that Tischendorf may find space in his forthcoming *Prolegomena* for a more complete examination of the subject than he has yet published. Perhaps the result will be that the corruption of the text, supposed by this critic to have taken place before the middle of the second century, exists rather in the Gospels than in the Epistles, and that it has but seldom affected the meaning to any considerable extent.

The peculiarity of this eighth edition is that it professes to be based on the earliest authorities, purely internal evidence being thrown into the background.

"Quo in negotio, postquam Bentlejus, quem rursus Lachmannus sequutus est, ea ratione acquiescendum censuit, quæ tempore concilii Nicæni per ecclesiam legi solebat, felicissime providente deo evenit, ut nobis ad Irenæi certe tempora redire liceat" (Preface, p. xiii).

To this objective criticism, produced in the case of Tischendorf mainly by the discovery of the Cod. Sin. (see his *Synopsis evangelica*, 3rd edit. p. liii), we have already expressed our adhesion, though it still seems to us desirable to keep in view the other object as well, that, namely, of restoring the original text. But is the editor justified in his assertion that he can generally recover the readings which prevailed most widely in the second century? We think not. Supposing that we could argue from the Latin translation which arose in the second century to the Greek text employed, we should not therefore have arrived at the most prevalent form of the text, and still less so if, with Tischendorf, we regard the original text as having undergone no slight modification before the date of this Latin translation. And it has scarcely been made out by the editor that the Cod. Sin., on account of its agreement with Origen or the *Itala* in isolated passages, deserves to be treated, even in a partial degree, as a witness of the second century. As the case stands at present, it will often be easier to restore the original text than that of the second century. Besides, the Cod. Sin. seems to be over-estimated in various places, even according to the editor's own principles, e.g. when John xxi. 25 is excised contrary to the express testimony of Origen.

In conclusion we will mention a few passages in which the sense is affected by the variety of readings, and from which it will appear how much depends on the correct application of a critical method, and that even such eminent critics as those before us, starting from essentially similar principles, not unfrequently arrive at a different result. For instance, Matt. vii. 13, Treg. reads ἡ πύλη, Tisch. brackets it; vii. 14, Treg. reads τί στενὴ ἡ πύλη, Tisch. ὅτι στενὴ [ἡ πύλη]. The former seems to me to be right in both cases: τί is more probable than ὅτι, as less common in this sense, and therefore liable to be replaced by the ὅτι of the preceding verse. Matt. xxvi. 28, Treg. has τῆς καινῆς διαθήκης, Tisch. τῆς διαθήκης. We prefer the former reading in this passage, the latter in Mark xiv. 24, and explain the omission of καινῆς in B from a harmonizing tendency, while A, for the same reason, has καινῆς in Mark xiv. 24. From the point of view of objective criti-

cism, Tischendorf might have omitted καινῆς with the two earliest MSS. Luke vi. 1, Tisch. has ἐν σαββάτῳ δευτεροπρώτῳ, Treg. omits it. No doubt it is wanting in B, but this is because the difficult chronological datum was not understood. John i. 18, Treg. μονογενὴς θεός, Tisch. ὁ μονογενὴς υἱός. The former reading is a dogmatic correction, as is shown by the patristic quotations. Explanations and alterations of the text by eminent Fathers have occasioned corrupt readings, more than many critics are inclined to allow. The works of the Fathers should therefore be examined in this as well as other aspects. Both our critics omit the addition to Matt. xxvii. 49, ἄλλος δὲ λαβὼν . . . αἷμα (comp. John xix. 35), in spite of a remarkable weight of testimony, and this with reason, at least if we aim at the original reading. Luke xxiii. 45, Treg. καὶ ἐσκοτίσθη ὁ ἥλιος, Tisch. ἐκλιπόντος τοῦ ἡλίου. The former is certainly correct, for a true solar eclipse does not take place at the time of the full moon (see the writer's *Chronologische Synopse*, &c. p. 387), but earthquakes are accompanied by obscurations of the sun. The Fathers, particularly Eusebius in his *Chronicon*, were accustomed to connect the year of the Crucifixion with a real solar eclipse reported by Phlegon (his words are ὁ ἥλιος ἐξέλιπεν), and this was the origin of the reading. Luke xxii. 43, 44, and xxiii. 34, are rightly retained by both critics, in spite of several old MSS., especially B (and we may now add B), which omit them with an evident eye to Christology. Luke ii. 1, both critics omit the article before ἀπογραφῇ; they have the historical fact, too, on their side. John v. 1, Treg. rightly omits the article before ἑορτή; Tisch., who omitted it in the seventh edition, now inserts it, apparently induced by B. Of course "a festival" is intended, namely Purim; comp. John iv. 35, vi. 4. So, too, he now reads, John v. 2, βηθζάβα, while Treg., with whom we rather agree, has βηθόσδα. These examples may suffice to show that the purely diplomatic method of criticism does not always lead (though it does often lead) to the discovery of the true reading, even in the hands of the most skilful and learned critics.

K. WIESELER.

**Christian Ethics.** [*Die christliche Ethik*, dargestellt von Dr. H. Martensen, Bischof von Seeland. Allgemeiner Theil.] Gotha: Besser.

It has been justly observed that ethics will continue to be the most interesting of the sciences, as long as it deals with general principles, and theories of the world and of life, but must at once become as tedious and trivial if we pass to disputed points of detail, such as are supplied by the doctrine of duties, casuistry, &c. Even Rothe gives an indication of sharing this view, when he declares (*Theolog. Ethik*, vol. iv. p. xlvii) that the pleasure with which he has worked at the doctrine of good and of virtue is equalled by the struggle it cost him to elaborate that of the duties. Our author, on the contrary, believes that the side on which ethics is related to the concrete forms of morality is equally important with the doctrine of principles (p. 82). How far he will succeed in avoiding the rocks of obviousness and redundancy, on which so many attempts to draw out a system of rules for life's shifting relations and demands have split, will be seen from the second part of this work. The volume before us is confined to the theoretic half of the subject. The introduction consists of an enquiry into the postulates of Christian ethics, i.e. the ethical conception of God as the only God, and of man as the creature made in the image of God. It is on the whole a summary of the contents of the well-known *Christliche Dogmatik*, to which this system of "Christian Ethics" forms the counterpart. As for the fundamental ethical conceptions themselves, our author treats of them under the points of view developed

and definitively constituted by Schleiermacher and Rothe, those, namely, of the highest good, virtue, and law. His manner, however, is nothing less than scholastically abstruse or pedantic. The vivid form which he employs in order to unfold the primary moral ideas, standards, and ideals, comes very near that of the English "essay." In tone he preserves a happy mean between the purely scientific and the religious or devotional, and we think his book will supply a valuable mental stimulus to those who combine a habit of reflection on the riddles of life with the traditional supernaturalism of which the author is a representative. H. HOLTZMANN.

### Intelligence.

Mr. S. R. Driver, Fellow of New College, Oxford, has edited, with a translation and notes, a commentary on Jeremiah and Ezekiel by R. Mosheh ben Shesheth. The author was a learned Spanish Jew, who emigrated to Babylonia towards 1200. He wrote scholia on several Biblical books, of which only the present is known to exist in a MS. of the Bodleian Library. His system is rational, not Agadic, and he is now and then really felicitous in his explanations. It was not an easy task to edit a unique MS., which is besides somewhat defective, and not very distinctly written. As far as we have seen, both text and translation are fairly correct; and the numerous notes of the editor testify to his knowledge of Rabbinic literature, as well as of modern grammarians. But why does he try the patience of his English readers by writing Raschi instead of Rashi, Chajjug instead of Hayyug? On the title-page we even find Ezeqiel; why not be consistent, and write either Y'hezqel or the naturalised Ezekiel?

Students of the text of the Old Testament will welcome the belated appearance of the nominally first fasciculus of Mr. Field's *Hexapla* (Clarendon Press, Oxford), containing fragments of the versions of the Pentateuch. The execution of the work shows no signs of falling off. Professor Dillmann has brought out the second part of the second volume of the *Æthiopic Old Testament*, containing the third and fourth books of Kings. It is based on a collation of three families of MSS.: 1. That representing the earliest form of the text; 2. That revised in accordance with another recension of the LXX. text; and 3. That corrected by the light of the Hebrew. The text is printed from the first of these three, but the variants, often considerable, of the other two are given in the notes.

Prof. Riehm has an important article in the *Studien u. Kritiken*, No. 2, on the so-called primary record in the Pentateuch, with reference to Graf's remarkable work on the historical books of the Old Testament.

Two popular essays on the narratives of the Deluge deserve attention from the reputation of their authors, one by Dr. Nöldeke in *Im Neuen Reich* (the new German *Macmillan*), the other by Dr. Diestel, in a series of lectures published by Holtzendorff and Virchow. A brilliant paper on the Bible and archaeology, by M. Jules Soury, in the *Revue des deux Mondes*, Feb. 1, seeks to co-ordinate the Assyrian discoveries (?) of M. Lenormant, who "glories in the name of Catholic," with the most advanced theories of Biblical criticism.

Dr. Davis' new *Student's Hebrew Lexicon* (Asher and Co.) aims at supplying a want that has long been felt by beginners. It is at least portable and cheap, but the attempt at comparative philology is of very questionable value. We decidedly prefer Bagster's *Gesenius*.

Dr. Hase, of Jena, most amiable and cultivated of "Rationalists," has published his recollections of his youth, chiefly from old diaries. *Ideale und Irrthümer* appeals not only, nor indeed chiefly, to theologians, but throws a flood of light on the political and intellectual currents among German students from 1818 to 1830.

Dr. Grätz, of Breslau, has gone to Jerusalem to collect further materials for vols. i. and ii. of his *History of the Jews*.

Prof. Oehler, of Tübingen, a moderate theologian of the semi-orthodox school, died on Feb. 18.

### Contents of the Journals and Notes.

*Jahrbücher für deutsche Theologie*, vol. xvii. No. 1.—Huther on the signification of *וְחַי וְנִשְׁבַּח* in the Johannine writings.—Schirm on hints for pastoral theology in the pastoral epistles.—Stern on John Milton and Calvinism. [Milton's theological liberality.]—Zwingli, a lecture by A. Ritschl.—Reviews of books: Ewald's *Biblical Theology*, by Dillmann. [Eulogistic.]—Kleinert's *Deuteronomy*, by Stähelin. [Approximates to the very singular position of the author.]—Merx' *Job*, by H. Schutz. [Very thorough review.]—Laurent's *Clemens Romanus*, by Jahn. [Unfavourable.]—Lipsius' recent works, by Weizsäcker; &c.

*Monatsschrift für Gesch. u. Wiss. des Judenthums*, Jan.—On the syllable *hal* in Deut. xxxii. 6, by Dr. Grätz. [Two motives for its

separation: 1. To emphasize the sentence; 2. To avoid the danger of cancelling a whole column, in case a syllable prefixed to the second name were miswritten.]—Feb.—The sons of Tobias, the Hellenists, and the Proverb-writer Sirach; and the prophet Jeremiah in Ramah, by the same. [1. To account for the apostatizing tendency among the Jews of that period; 2. To show that Jer. xxx. xxxi. xv. 10-19, were written after the fall of Jerusalem among the captives at Ramah.]

### New Publications.

KALISCH, M. M. *Leviticus*. Part II. (completion), with historical and critical commentaries, a new translation, and five treatises. Longmans.

KEIM, Th. *Geschichte Jesu von Nazara*. III. Band (Schluss). 2. Der Jerusalem. Messiasstod. Zürich: Orell, Füssli und Co.

LUYNES, Duc DE. *Voyage d'Exploration à la Mer morte, à Pétra et sur la rive gauche du Jourdain*. (En livraisons.) Paris: Bossange.

### Philosophy and Physical Science.

#### A NEW SYSTEM OF PHILOSOPHY.

*Philosophy of the Unconscious*. [*Philosophie des Unbewussten*. Von Eduard v. Hartmann. Dritte beträchtlich vermehrte Auflage.] Berlin: Carl Duncker, 1871.

THE rise of a new philosophical system, which its adherents hail as embodying the most important metaphysical discovery since Hegel and Schopenhauer, cannot be viewed with indifference, and curiosity changes into interest when we find on what principles it claims to rest. Dr. Hartmann modestly confesses that the mysteries of the Dialectic Philosophy are as inaccessible to him as to the ordinary world, and he declares in favour of a simple inductive method, by which he hopes to reconcile or at least to lay the foundations of a system which shall reconcile and embrace the last conclusions of physical science and speculative philosophy. He does not disguise from himself the difficulty of the task, and it would certainly be impossible to exaggerate its importance. In examining the value of his present contribution towards its accomplishment, we must remember that something is gained if only the conditions of the problem have been clearly stated, and the best means for its solution correctly pointed out. For this reason we are anxious to do full justice to the "Philosophy of the Unconscious," and though the author is somewhat unmethodical in the exposition of his views, this can perhaps be better done by following his own arrangement than by recasting his arguments in a logical order which he might repudiate.

The nature and existence of "the Unconscious" have to be explained and demonstrated in the course of the work, but the meaning of the name can be described at once; it does not stand for *unconsciousness*, but for "the unknown positive subject of whom unconsciousness can be predicated," for the *unconscious Will* and *unconscious Idea of the Unknown*. The name is new, but the thing, as the author explains, is only his equivalent for the common first principle of every considerable philosophy (Spinoza's Substance, Schelling's Subject-Object, Fichte's Ich, Plato's and Hegel's Idea, Schopenhauer's Will, &c.), now for the first time approached by the light of scientific experience instead of *a priori* reasoning. To relieve philosophy from the reproach of remoteness and unpracticality would be much, and considering how slowly metaphysical science advances, it would perhaps be more to have suggested a name which designates the sum of our actual ignorance rather than a climax of fancied knowledge. There are some scientific discoveries which are a mere question of time and patience, there are others which may reasonably be expected to follow from the first, and there are also questions which we are at present quite unable to conceive as soluble by the methods of

mathematical or physical science. If these questions have anything more than their inscrutability in common,  $x$  might be a better name than the Unconscious for the unknown quantity; but it is certainly well that there should be some general name under which we can conceive all that we do not know in contradistinction to all that we do or easily might know. Unfortunately, Dr. Hartmann aims at more than this simple clearance of the intellectual ground, and the whole superstructure of his argument rests on no more solid basis than the evidences of design in nature! It is the old story of the watch and the watchmaker with fresh illustrations taken from the more curious facts of natural history, and we might think we were reading Paley but that the name of the artificer is changed, for the Unconscious is endowed with all the old theological properties, Eternity, Omniscience, Omnipotence, and especially Incomprehensibility, which serves here as elsewhere to explain why the others are not of more use to their possessor.

The author confesses that he does not hope to convince any one who is not already persuaded that nature works with a purpose (*Endzweck*), and he is perhaps right not to think highly of the efficiency of reasoning if he himself, after studying Spinoza, Hume, and physical science, still finds it possible to ascribe anthropomorphic motives to nature and to consider cause as a metaphysical idea. However, in support or confirmation of the opinion where it exists, he has one curious argument. Assuming that everything must have an efficient cause, that cause must lie either in the material circumstances attendant on the production of the effect, or in other material circumstances, or it must be of a spiritual nature. The second alternative is inadmissible because all the material circumstances which can in any way influence the result are supposed to be reckoned in the first, so that it may be said that there is an equal antecedent probability in favour of the material or the spiritual character of the desired cause. Thus far there is nothing amiss, except the application of the law of chances to ascertained physical facts; but the author proceeds to argue as if no physical facts were ascertained, that the probability of the cause being spiritual increases with every material circumstance that is set aside as not cause. In illustration he enquires why hens sit, and children see with their eyes, and enumerates the conditions required for both phenomena, with the omission of the one thing needful in the eyes of a naturalist—their descent from animals with eyes and a habit of hatching eggs. Of course the laws of inheritance can only give the reason, not the cause, of the occurrence, and science does not trouble itself to provide the hen with an adequate motive for her sudden adoption of a sedentary life, such as Dr. Hartmann finds in the intention of the Unconscious that the species shall be preserved. But in the second case there is not even the appearance of voluntary action, and all the mathematical formulæ brought together to determine the degree of improbability ( $0.99994$ ) that the fourteen physical conditions of sight which he enumerates should come together fortuitously, are little short of absurd in face of the simple fact that parents with two eyes and the necessary optical apparatus do, under normal conditions, invariably give birth to children similarly endowed.

The body of the work—for thus far we have not got beyond the introduction—is divided into three sections:—A. The corporeal manifestations of the Unconscious; B. The Unconscious in the mind; C. The metaphysics of the Unconscious. In these, two points have to be established: first, that the words unconscious thought and unconscious will do not involve a contradiction in terms; and, secondly, that we see traces in nature of thought and will which we cannot refer to any known conscious subject. It is one of

the difficulties of the attempt to reconcile science and speculation that we are obliged to use abstract terms before the nature of the things they denote has been ascertained. In the present case we are called upon to recognise the assumed effects of Will and Idea in the first book, while the possibility of their existence is considered in the second, and their reality not till the third book. A better arrangement might have been possible, though, we admit, not easy. Following the author, we begin with “the unconscious will in the independent spinal and nervous systems,” and the “unconscious idea which presides at the execution of involuntary (*i.e.* reflex or mechanical) movements.” Apart from the teleological tendencies already noticed, it is a matter of indifference (or terminology) whether conscious human will is explained away into the action of physical laws, or whether the action of physical laws is uniformly described as voluntary, but less than nothing is gained if we are simply invited to credit nature with will in its popular acceptance of free preference and choice. In some passages the author seems almost guilty of this inconsistency, but it is not a necessary part of his system. Will in the abstract does not exist, and any particular act of Will can only will the transition from one state or condition to another. The tenor or content (*Inhalt*) of the Will is formed by the Idea of two states, one of which is viewed as actual and the other as desirable, and the will itself is the longing or striving after the realisation of the second idea, or, to speak more precisely, Will is defined as the immediate cause of whatever change takes place.

Before tracing the distinction between conscious will and idea and the same faculties as ascribed to the Unconscious, we have to ascertain what the author understands by consciousness. In the first part the answer is that of simple materialism: the threshold of consciousness is passed whenever the clearness and strength of the brain-vibrations reaches a certain point. It is in the account of what takes place short of that point, and in the metaphysical explanation of the dawn of consciousness, that, for better or worse, we come to something original. Consciousness (Bk. C. 3) is also “the stupefaction of the will at the sensible existence of an idea not willed by itself.” How the will, which, according to a very able argument, is shown a few pages farther on to be naturally and necessarily unconscious, can be supposed capable of feeling (*i.e.* being conscious of) astonishment, is not explained. And the companion demonstration that consciousness cannot be an inherent element of the idea, but must be something accidental to it produced from without, has the effect, whether intentionally or not, of neutralising all the preceding materialist admissions. In effect Dr. Hartmann makes conscious thought material, and unconscious thought the reverse, a proceeding plainly at variance with his own principles of the economy to be observed in explaining natural phenomena. The passages which he quotes from idealist philosophers, who knew even less than we do of the physiology of the brain, to show that they recognised the existence of thought which had not quite passed the threshold of consciousness, refer in their original contexts rather to thought which as thought is not yet quite perfect and complete. Spinoza’s “confused ideas” should have been coupled with Kant’s “*dunkle Vorstellungen*.” We should have expected to find a writer, who goes so far in his devotion to positive science, prepared either to deny the existence of unconscious ideas or to explain it as a state of the brain to which the finishing touch, which brings consciousness, was still accidentally wanting. Materialism offers the simplest solution of such problems as memory, association, &c., for material modifications of the brain may be of many kinds or degrees without quite reaching that kind or degree which corresponds to completely developed

thought or consciousness. And it is not easy to see why, after braving the dangers and difficulties of an unpopular system, he rejects its help when most readily available. If consciousness presupposes thought, and thought presupposes certain physical conditions, the cross requisition of a contradiction to will is superfluous, though its presence may be recorded as a fact in psychology. But psychology is not the author's strongest point, at least there is much that might be objected in detail to his account of the next phase of the unconscious idea, in which it seems simply to be a name for as much of our ordinary mental processes as has become mechanical and involuntary from habit, or is too swift and simple for analysis.

After the proof that unconscious thought is possible follows the enquiry into the thought of the Unconscious, and all Dr. Hartmann's learning and ingenuity are called upon to bridge the yawning gulf between the two. He explains by the influence of the Unconscious in language the strangely perfect grammatical arrangements of barbarous languages, which have before now been claimed by Christian apologists as evidences of the miraculous origin of speech, and are scarcely more strange than the way in which figures lead of themselves from one combination to another, or the way (only proving that human thought obeys its laws) in which men of genius divine remote discoveries, and one intelligent system of philosophy is always on the point of blending with another, and that of leading to a third. But his chief reliance is of course upon the argument from design, in support of which he multiplies stories of instinct and instances of adaptation, from all of which he draws the same inference which their number does not strengthen; namely, that the course of the material universe is governed and actuated by mind, to wit, the mind of the Unconscious, an entity of a somewhat theological character, indefinitely more so at least than Spinoza's God, as the author in his third edition expressly admits. Here it is that Dr. Hartmann disappoints expectation: the Unconscious, or, as we should prefer to say, the Unknown, must be looked upon provisionally as the agent in innumerable natural processes; but it is impossible that a general name, improbable that a supernatural being, should be actuated by human feelings such as want and wish. The actual tendencies of nature can and must be recorded and summed up, but we can account for very few, and the attempt to explain and motive all has never yet led to anything but Fetishes. But even supposing, as in the absence of proof to the contrary is allowable, that the Unconscious is the one and indivisible mind of the universe, it does not, on the whole, will the preservation of every species, but (since it is omnipotent) what takes place, *i.e.* the struggle for existence, and the alternating inferiority of its own most ingenious contrivances for offensive and defensive warfare.

The distinction between the will of the brain and that of the nervous or muscular system is no doubt valid. The brain possesses very little indirect and no direct power of influencing the course of such vital functions as the circulation, respiration, digestion, &c., which are fairly paralleled to the instinctive life of less developed animals, and like that might perhaps be ascribed to the unconscious will of the organism, but have nothing to connect them with the intelligent will of the Unconscious. The author supposes "intelligence in the central organs," but the intelligence is probably of the same transcendental character as the will and the ideas: for, whatever else is doubtful, science certainly tends to establish an indissoluble actual connection between rational and conscious mind and brain-fibre of a particular kind. It is for physiologists to decide whether the spinal marrow and ganglions do what they do in so far as they approximate in

composition to the organ of thought, but the intelligence of which Dr. Hartmann speaks is independent of these conditions. Instead of resolving the dualism of mind and matter into a higher or simpler unity, the third hypothetical element which he introduces merely parodies the known forms of the other two, and while its very existence does not admit of scientific proof, the imaginary fertility of the principle discourages really hopeful trains of thought. Thus, in the third Book the author appears for a moment on the point of arguing to the real existence of the world from the independent material existence of the human body as evidenced by the material conditions of thought, some of which fall within and others without the direct sphere of consciousness. The hint is not followed up, though we can scarcely imagine a discovery more likely to lead to the reconciliation of science and philosophy than a rational inference from physical facts in favour of a doctrine which no deductions *a priori* have yet succeeded in securing against the attacks of scepticism.

It would take too long to examine the "Metaphysics of the Unconscious" as carefully and minutely as they deserve, for even when we decline to follow, or perhaps fail to trace, the thread of the main argument, the incidental matter is always interesting and suggestive, and the more abundant that the author's method is not severely consequent. Chap. V., "Matter as Will and Idea," is perhaps the most important, though the physical theories it contains are rather in advance of our present knowledge, and, a still more serious objection, they do little to support the metaphysical assumptions previously made. In a perfectly consequent scheme unconscious mind would correspond to rudimentary atomic matter; the Unconscious would begin where the conscious ends, and the continuity of nature, already defended in a chapter on Consciousness in the Vegetable Kingdom, might have been firmly established. The existence and nature of the Unconscious, however, having been already taken for granted, it only remains to reduce the elements of consciousness to their simplest form. Matter is, on the one hand, "a system of atomic forces in a state of equilibrium," on the other, "a combination of acts of will emanating from the Unconscious." Of course, the idea of force ends by swallowing up that of the material upon which it acts; but we must ask what is a *Kraftpunkt* without the idea of extension, and therefore of body; and in this atmosphere of rarefied speculation the paradoxical redundancy of the Unconscious to cause what is already accounted for, or to account for what does not take place, is more apparent than ever. The conception of individual existences is also rendered unnecessarily difficult by the attempt to deduce their singularity from the Unity and Totality of the Unconscious. Individuality of character is surely either a series of facts or a generalisation based on them, and in real existence it is similarly either physical or rational; the germ-cell and the conscious mind are one and many, according to the definition preferred.

We have not as yet noticed the extent of Hartmann's obligations to Schopenhauer, which are about equivalent to those of Schopenhauer to Kant, but rather less freely and gratefully acknowledged. In the chapter on "The Unreason of Willing and the Misery of Being," Schopenhauer's influence is supreme, for pessimism is not the conclusion to which a systematic admiration of the works of nature would seem to point. Optimism of an unusually sweeping character would have been more natural, and indeed the supposition of unconscious happiness seems almost necessary to stimulate the unconscious will to give effect to the unconscious idea. Instead of this we find one more paradox. The Unconscious is All-wise and All-powerful, and the world is

the best possible world; but that does not interfere with its being heartily bad, and in fact a great deal worse than nothing. *Why* it could not have been better is not exactly explained, though the author is no doubt right in supposing that it would if it could. His remedy for its evil estate only differs from that of Schopenhauer in being more radical. Annihilation is the goal, but the annihilation of the individual is not enough.

"Du kannst im Grossen nichts vernichten  
Und fängst es nun im Kleinen an"

is the reproach he addresses to his master. The release of one man is followed (such is the imbecility of will) by the birth of another, and even if the whole human race were to die out by common consent, nothing would be gained, for "the poor world would still continue and the Unconscious would have to take the first opportunity of creating a new man or other similar type." "The whole creation groaneth and travaileth with us," and the problem is to enable the rational will for self-destruction to outweigh the blind, *alogical*, absolutely stupid creative will. Consciousness is the first step towards the attainment of the desired result, but the later ones are involved in mystical obscurity, only for our encouragement it is pointed out that the world will probably have an end, because it has an *Endzweck* (aim) which would be absurd on its part if the aim were not attainable, while its attainment of course marks the conclusion of the world-process thereto directed. Here however an awful prospect opens before us. Even when the universe has committed suicide by the exercise of moral forces as yet undreamt of, "the possibility still remains that the potentiality of the will may once again decide itself in favour of willing," and a new universe and after that another and an endless series beyond may come in the future to know "the misery of being." It is true that the author calculates the probabilities after his favourite fashion, and settles that the chances are against existence, but the apprehensions he excites are too lively to be allayed by a sum. Schopenhauer's Nirwana is surely better than this still more Indian vision of infinite worlds. The blind will which has once produced the calamitous phenomena of existence may do so again, for it is as incapable of experience or memory as of reflection, while no being capable of reflection could have voluntarily created the mass of evil actually extant.

This last rather circular argument has not prevented the obvious enquiry as to the difference between Dr. Hartmann's "Unconscious" and the God of the vulgar. In the rapidly succeeding second and third editions of his work he has attempted to answer the question in a manner which seems, upon the whole, intended to qualify the uncompromising irreligion of his central standpoint. He treats Pantheism as the inevitable outcome of philosophical theism, and admits that the Unconscious is simply the Pantheist's God without the attribute of consciousness, which he thinks ought not to be ascribed to nature on the mere ground of analogy, though he was content to attribute intelligence for no better reason. He concludes that there is no valid distinction between philosophical theism rightly understood and the philosophy of the Unconscious, but the motto on his title-page, "Speculative Resultate nach inductiv-naturwissenschaftlicher Methode,"

should warn him not to carry his concessions too far. Philosophical theism, however "rightly understood," is not a doctrine that can easily be proved by the inductive methods of natural science. The other additions, amounting in all to something like a seventh part of the original work, serve rather to complete and amplify the superstructure than to strengthen the foundations of the system, or to modify its general character.

To sum up the results of this new philosophy in a few words: The Unconscious is a metaphysical divinity who reigns but does not govern; Will is an irrational fate whose decisions are not final, and Consciousness is the creature of one and pupil of the other of these two inaccessible forces which it is to reconcile in the common destruction of itself and them. Untenable as a system, the "Philosophy of the Unconscious" is certainly the work of an able man, but the author is heedless as well as daring, and he follows the uncertain course of his ideas without pausing often enough to compare the whence and the whither.

H. LAWRENNY.

### Intelligence.

An attempt is being made to raise a testimonial—"Ehrendank"—to Ludwig Feuerbach. The committee who have recently published an appeal on his behalf include (among other well-known German residents in England) Professor Goldstücker, Dr. Max Schlesinger, and Feuerbach's former fellow-worker in the famous *Hallische Jahrbücher*, Arnold Ruge. The intrinsic value and historical importance of Feuerbach's work none can doubt who has even a superficial acquaintance with the troubled period of German thought from Hegel's death to the revolution of 1848: a period dominated by the effort to unriddle the ambiguous utterances which—in all departments of thought, but especially in theology—the oracle of Berlin had left as the final outcome of philosophical method. Among the knot of younger thinkers who first developed in a negative direction and finally broke loose from the master's system, Feuerbach is the most impressive, with the doubtful exception of Strauss. His work has not the weight derived from concentration and coherence, nor his mind the clear grasp and steely acumen that belong to Strauss, but in impetuous comprehensiveness of speculation, the passionate earnestness of utterance, even the very incoherency and inconsistency with which he pursues truth in leaps and springs down the bewildering precipice of negation, he seems the more representative man. As such work as his inevitably excludes the worker from the ordinary material rewards of intellectual toil, such a recognition of its value as the committee propose seems very appropriate, especially when, as the appeal informs us, the philosopher, at the age of 68, is bearing the double burden of disease and severe pecuniary losses. The treasurer's address is, Herrn Gustav Sachs, 39, Mincing Lane, E.C.

### Scientific Notes.

#### Anthropology.

**Primitive Urn.**—Dr. Marschall, of Marienburg, describes (*Zeitschrift für Ethnologie*, Berlin, 1871, part vi. 120) an urn found in an ancient tomb at Liebenenthal near Elbing, on one of the mouths of the Vistula. The remarkable feature of it is that, while the other clay urns found in the district are invariably plain, this one has a cover rudely modelled in the form of a human head, resembling the Canopic urns of the Egyptians, and, still more, certain very early examples of Etruscan pottery. Dr. Marschall points out that the place where this urn was found is not more than six German miles distant from the ancient Truso (on Lake Drusus), the centre of the amber trade in early times, and imagines Etruscan traders to have conveyed or sent thither, among other wares to be exchanged for amber, urns of this description. But the Liebenenthal specimen is more rude than the rudest Etruscan ware: whence it is conjectured to be the work of a native potter copying perhaps a pretty rude Etruscan model, a conjecture which seems to be well founded considering the amount of Etruscan work in metal and other materials already found, not only in the district in question and along the shores of the Baltic, but also in most other parts of Europe. The dates he assigns as the limits within which it must have been made are B.C. 1000 and B.C. 300, corresponding to the duration of the Etruscan nationality. The word Trusi may or may not be related directly to Trusci and Etrusci.

**Stone Implements found in Greece.**—Mr. George Finlay's collection of implements of the stone age found in Greece consists now of about 300 pieces, considerable additions, both in numbers and importance, having been made during the last year. Dr. Hirschfeld (*Zeitschrift für Ethnologie*, Berlin, 1871, part v. 106) describes them as mostly axes, chisels, and hammers, but all excepting two without any trace of handles. Two are of precious stone and small, one being cornelian, the other amethyst, but the material generally is serpentine, diorite, nephrite, granite, porphyry, or hæmatite. It is strange that of all places in ancient Hellas the first where implements of the stone age were found should be the neighbourhood of Orchomenos, the seat of the

Minyæ, whom the Greeks used to look back to as the prehistoric founders of their civilisation. As yet these implements have mostly been found in Eubœa, Boeotia, Attica; in the Peloponnesus at Gythium, Sikyon, Corinth, and Epidauros; in Macedonia, at Athos, and in Thessaly. Mr. Finlay is an English resident at Athens, and well known as the author of the *History of the Byzantine Empire*.

In the *Journal of the Anthropological Institute of New York*, vol. i. No. 1, 56, J. W. Ward describes some remarkable sculptured rocks near the town of Barnesville, Belmont County, State of Ohio. They are the outcrop of the coarse carboniferous grit of the Muskingum coal-beds, and lie, slightly tilted, a foot or two above the soil. They bear, as the drawings accompanying the paper show, chiselled intaglios of the foot-prints of the buffalo, deer, wolf, or possibly the dog, the bear, land-birds, one of which is undoubtedly the turkey, water birds, and prominently man, both juvenile and adult; presenting in each case the exact appearance of the natural tread in plastic clay of the several animals represented. In the case of the representations of the birds' feet, the details of the general plant of the foot, the spread of the toes, the joints, the phalangeal cushions, and the whole impressions are so perfect that the author almost accepted the suggestion that they are real bird-tracks. Engraved figures of the foot-tracks of animals are frequently met with throughout the States, rarely, however, in association with those of man, and they are generally mere scratches in outline. On each of the Belmont slabs is a well-drawn figure of a serpent in motion.

### Geology.

**The Nullipores in Limestone.**—Limestones of many formations, but especially of the triassic and tertiary, are composed of small organic bodies, which have hitherto generally gone by the collective name of "Nullipores." C. W. Gümbel has collected Nullipores of every variety, from all formations, and subjected them to the most critical examination. In a lengthy paper on the subject (*Abh. der bairischen Akademie*, II. Classe, Bd. xi. Abhandlung 1) he divides the so-called Nullipores into two great groups, the one belonging to the Dactyloporæ and the other to Lithothamnium; the former occur principally in triassic rocks, the latter in tertiary limestones. There are likewise a number of subordinate forms, as Ceriopora, Pustulopora, &c. As yet Gümbel has only described the second group, the Lithothamnizæ. It is remarkable that the recent representatives of this group contain only two per cent. of organic matter, the remainder being inorganic, and consisting chiefly of carbonates which were most probably produced in the organism of the plant from the sulphates of lime and magnesia of the sea-water. This powerful collector and consumer of carbonates of lime caused during the tertiary epoch the enormous deposits of "Nullipora" limestones of the Vienna basin, of Northern Italy, and the pisolitic limestone of Paris. A point of great interest is the enormous percentage of magnesia in certain recent Lithothamnizæ, reaching in some cases 17 per cent. And it is a question whether the agent of the direct formation of dolomite and dolomitic limestone may not perhaps be traced to this vast collector of mineral matter.

**Infra-Lias in Yorkshire.**—The Infra-Lias, *i. e.* the zone of *Ammonites planorbis* and *A. angulatus*, has hitherto been only found at Redcar. In a paper read at the meeting of the Geological Society of London, January 24, the Rev. J. F. Blake described its occurrence in section at Cliff, near Market Weighton, where it and lower beds are well exposed, and yield an abundant suite of fossils. He considers, however, that these beds do not belong to the typical Yorkshire area, but are the thin end of the series which stretches across England. He supposes there was a barrier in Carboniferous times, separating the coalfields of Yorkshire and Durham, breaking the continuity of the Permian beds, and, curving round the secondary rocks to the north of it, formed the real Yorkshire basin, while the beds at Cliff were immediately to the south of it.

**The Upper Greensand of the Neighbourhood of Cambridge.**—At a meeting of the Geologists' Association, held on February 2, the Rev. J. G. Bonney, of Cambridge, read a paper on the geology of the Cam valley, and described the position of this seam, which is barely a foot in thickness, and rests on the eroded surface of the Gault. It is full of green grains and dark nodules, rich in phosphate of lime, the matrix being a fine chalky marl, full of Foraminifera and minute fragments of organisms, with a considerable mixture of mud, insoluble in hydrochloric acid. The composition of the green grains, commonly called glauconite, was shown to differ considerably from that of the typical mineral bearing the name. He failed to convince himself that any of the granules are casts of Foraminifera. The fossil remains of the deposit are remarkable, more especially for the number and size of the Pterodactyles and Turtles. Mr. Bonney believes this deposit to have been formed during the Upper Greensand epoch, but to contain many fossils that have been derived from the Upper Gault by slow denudation.

**The Occurrence of Brackish Forms in Marine Deposits.**—Dr. Lorenz was the first to notice that in places where organic masses

are in process of decomposition a true brackish fauna springs up. Th. Fuchs (*Verhandl. geol. Reichsanst.* 1872, No. 2, 1) has had an opportunity of observing the same phenomenon in the Bay of Messina, where large quantities of refuse are thrown into the sea at a point where a brackish fauna has arisen, strangely contrasting with the neighbouring marine forms. He found amongst them large numbers of *Cerithium mediterraneum* (Deh.), with *Buccinum neritum*, *B. corniculum*, *Columbella rustica*, &c., all forms that are common in the fauna of the Sarmatian etage. This observation explains the sudden appearance of brackish shells with marine ones in the same deposit, and accounts for the fact that, with very few exceptions, all coal-beds contain representatives of a brackish fauna.

**Scarcity of Organic Life in the Alpine Flysch.**—Dr. Carpenter and Mr. T. G. Jeffreys, it is well known, made the startling discovery that the great depths of the Mediterranean are entirely destitute of organic life, and they hinted in their report at the possible absence of all traces of life in the great sandstone zone of the Flysch, assigning to it a deep-sea origin. Th. Fuchs (*Verh. geol. Reichsanst.* 1872, No. 2, 2) controverts this view, and shows that the Alpine Flysch possesses an abundant, though monotonous, fauna of Annelida, while Fucoides are so plentiful that the zone has received the name of Fucoid sandstone. These remains clearly indicate a shallow-sea origin for the Flysch.

**Alpine Formations in Eastern Transylvania.**—The labours of the Kön. Ungar. geol. Anstalt (the Hungarian geological survey) during the last year demonstrated beyond doubt that the mountain-ranges dividing Transylvania from Moldavia are an eastern continuation of the Alps, or rather of the Bakonyer Wald, which is the eastern extension of the Alps. Between Transylvania and the Alps a tertiary sea covered the enormous tract of country now forming the plains of Hungary. Among strata yielding great numbers of Alpine fossils may be mentioned the Werfener shales, Guttenstein limestone (Trias), the Grestener and Hierlatz strata (Lias), and Lower and Upper Neocomian. (*Verh. geol. Reichsanst.* 1872, No. 2, 27.)

**The Geology in China.**—In a letter on the "Regions of Nanking and Chinkiang," by Baron von Richthofen, dated August 31, 1871, this indefatigable traveller and geologist gives a short sketch of the result of his geological investigations in China. He has distinguished the following groups:—1. *The Peking system*, which covers the largest space in Eastern Asia, and most probably corresponds with the Silurian formation of Europe and North America. Eruption of granite and great disturbances in connection therewith towards the end of this period are to be traced. 2. *The Nanking system*, representing our Devonian formation, consisting principally of quartz sandstones, with coal-beds, lead and iron ores. 3. *The Kitao limestone and coal formation*, which resembles the Carboniferous of Europe, and is divisible into two groups. 4. *The Tatung strata* consist of stratified conglomerates of unknown age, and seem to have been deposited as deltas of rivers. Over these again are loess and alluvium.

**The Upheaval of the Swedish Coast.**—Not far from Morup, on the Hålland shore, is a large block, ten feet high and fifteen feet broad, which served as a beacon as far back as the eleventh century. In September 1816 this stone was, according to the measurements of Bexell, four feet above high-water mark, and it still bears an inscription to that effect. It is stated in *Ausland*, 1872, No. 8, 191, that this block of stone was last summer 120 feet from the shore, indicating a comparatively recent and rapid upheaval along this coast. In no historical records of this stone it is stated to have been actually in the water, but invariably at the water, from which it appears that the upheaval commenced with the present century, and is now rapidly progressing.

### Physiology.

**Mechanism of Thought.**—An important paper was read at the last meeting of the Medico-Chirurgical Society on this subject, by Dr. Broadbent. His theory was based partly on the results of his own dissections, partly on remarkable cases of loss of speech and paralysis that either came under his own notice or have been recorded by others. It may be broadly stated as follows. The impressions derived from the several senses are conducted by fibres radiating from the *crus cerebri* and central ganglia to the convolutions of the longitudinal and Sylvian margins of the hemispheres, the intervening convolutions receiving no radiating or callosal fibres. In the former the impressions are associated together into ideas, whilst they become the subjects of thought in the latter. Now, when it is desired to express these trains of ideas in speech, impulses are transmitted along those medullary fibres of the brain that extend from the supreme centres to the third left frontal convolution. In this the ideas are formulated into words, as representing intellectual symbols, the centre selecting, as it were, the sounds appropriate to the expression of the idea. To produce the audible expression of these sounds, that centre again in its turn propagates impulses to the *corpus striatum*, the great co-ordinating motor centre at the base of the brain. In order to speak, a great variety of muscular movements required then have to be co-ordinated; those,

in short, governing the movements of the chest, the larynx, the tongue, and the lips. The co-ordination of these muscles is effected by the *corpus striatum*, which acts upon the requisite nerve nuclei in the *medulla oblongata*, and thus speech is effected. Lesions at different points of this chain of ganglia and nerves are of course accompanied by different symptoms, some of which are of a most remarkable character. The sequence of events on this theory then is: the formation of ideas in the marginal convolutions at the summit of the sensory tract; the employment of these in trains of thought in the convolutions withdrawn from immediate relation with the outer world; the propagation of excitations to the third left frontal convolution, leading to the selection of certain sound groups; the co-ordination in the *corpus striatum* of the muscular movements required to produce those sounds; and, finally, the transmission of impulses from the several nuclei of the *medulla oblongata* to each individual muscle required to be brought into play.

**Position of the Centre of Gravity in Insects.**—F. Plateau contributes a paper on this subject to *Nature* (Feb. 15, 1872), in which he shows that the centre of gravity in an insect is situated in the vertical and median plane which passes along the longitudinal axis of the body. It occupies a position almost identical in Insects of the same sex and species when in the same attitude. The exterior form of the body, however, rarely allows its exact position being determined without experiment. The centre of gravity varies in position in the two sexes; and during metamorphosis the relative centre approaches the head, whilst the absolute centre recedes from it. While standing, the centre of gravity is placed at the base of the abdomen, or in the posterior portion of the thorax, and usually in the centre of the length of the body. In walking it undergoes constant displacement around a mean point too small to be measured. In aquatic insects the centre of gravity is nearer the lower than the upper surface of the body. F. Plateau also points out what are the displacements of the centre of gravity in flying and swimming.

**The Influence of Violet Light on the Growth of Animals and Plants.**—General Pleasonton, of Philadelphia, has been engaged on some very interesting experiments on the influence of light transmitted through violet glass in developing animal and vegetable life. Cuttings of vines of some twenty varieties of grapes were planted in a vinery in the roof of which every eighth row of glass was violet-coloured. Very soon the vines placed under the violet glass began to attract attention by their rapid growth, attaining in the course of five months a growth of 45 feet in length, and an inch in diameter at the distance of one foot above the ground. Besides the formation of new wood, and the display of the most luxuriant foliage, there was a wonderful number of bunches of grapes, which soon assumed the most remarkable proportions, the bunches being of extraordinary magnitude, and the grapes of unusual size and development. The vines have continued, year by year, to produce remarkably large crops, without any apparent abatement of vigour. Similar experiments were tried on young pigs and calves, and though the results were not quite so striking, yet the animals exposed to violet light grew decidedly faster and showed greater vigour than those exposed to ordinary white light.

**The Minute Anatomy of Serous Membranes in Health and Disease.**—A provisional communication on this subject appears in the *Centralblatt für die medizinische Wissenschaft* for January 1872, from the pens of Dr. Klein and Dr. Burdon Sanderson. Their researches embrace experiments and careful microscopic observations made on no less than 250 animals, including rabbits and guinea-pigs, many frogs, several cats and dogs, some rats, and a monkey. They commence by describing the lymphatics of the central tendon of the diaphragm, which they divide into an anterior and a posterior set, connected by means of fine lacunar passages, which run straight from before backwards. They admit the presence of the same stomata and the characters of the endothelial cells to be the same as v. Recklinghausen has described. They injected the peritoneal cavity with various fluids, such as a mixture of starch and oil, a turpentine solution of alkanin reduced to fine drops by agitation with an aqueous solution of gum, aniline and oil of milk, and other fluids; and they have satisfied themselves that absorption takes place not only through the true stomata, but by pseudo-stomata, juice or serous canals, whence the absorbed fluids are conveyed to the true lymphatics.

**Physiology of Wings.**—Dr. J. B. Pettigrew's researches appear in the *Transactions of the Royal Society of Edinburgh*, vol. xxvii.; and a good abstract is given of them in the *Edinburgh Medical Journal* for Feb. 1872. The author shows that the wing acts as a kite during both the down- and up-stroke, and that it elevates and propels in either case—the rising and falling movements merging by insensible degrees into each other to form one pulsation. As the wing rises, the body falls, and *vice versa*; the wing, when the body of the flying animal is advancing in space, describes a *waved* track, the body describing a similar but smaller wave; the wing is twisted upon itself when at rest, and when in motion; the ill-defined impression produced on the eye by it, when set in rapid vibration, is concavo-convex and twisted in form. The under or concave surface of the wing, in being carried obliquely forward against the air by the body, is effective both during the down- and up-stroke; the wing rotates in the direction of its length and breadth as it rises and

falls, and reverses its places more or less completely at every stroke. It produces during one stroke the currents by which it is elevated during the succeeding stroke—the wing literally rising on a whirlwind of its own forming. The wing is movable and flexible as well as elastic, and capable of change of forms in all its parts; it is forced into waves during action, and impinges on the air as an ordinary sounddoes; it produces a cross pulsation, the pulsatile waves running in the direction of the length of the wing and across it; during vibration it moves on the surface of an imaginary sphere; the natural wing, when elevated and depressed, must move forwards; the movements of the wing are comparatively slow at its root, but very rapid at its tip. Balancing is in a great measure effected by purely mechanical arrangements operating independently of the will of the animal; weight is necessary to horizontal flight; the wing acts upon yielding fulcra; a regulating power is necessary in flight, the wing being at all times thoroughly under control. The wing in the bird descends as a long lever and ascends as a short one, the tip of the wing describing an ellipse while doing so; the wing forms a parachute, from which the body is suspended both during the down- and up-stroke; the wing opens and closes as it rises and falls, and has a valvular action; and all wings are drawn toward the body, and partly elevated by the action of elastic ligaments.

**The Relative Powers of Substances to Prevent the Generation of Animalculæ.**—A pamphlet has been published by Dr. J. Dougall, of Glasgow, giving in tabular form the accounts of a great number of substances which prevent the appearance of animalculæ when they are added to infusion of hay, mixtures of beef-juice and albumen of eggs, and other liquids capable of undergoing putrefaction. He arranges them in fifteen groups. The metallic salts form Group I. on account of their showing the highest average preventive power; amongst these sulphate of copper occupies the highest position—higher even than bichloride of mercury—whilst nitrate of silver exhibits the lowest individual average; taken altogether, however, the metallic salts are very uniform in their action. In Group II. we have the organic acids; of these benzoic acid has the highest and acetic the lowest average power; carbolic acid only occupies the fifth rank. Group III. comprises the salts of the alkaline earths; of these chloride of aluminium stands highest. In regard to the inorganic alkaline salts, their position would be extremely low were it not for bichromate of potash which is very high. The poisonous vegetable extracts are inert. These results, as Dr. Dougall points out, have an important bearing on the disinfecting method of treating wounds, so strongly advocated by Mr. Leslie, of Edinburgh; for, if the advantages of this method be due to the power possessed by carbolic acid of preventing the growth of germs, it is obvious that solutions of chromic acid, bichromate of potash, and sulphate of copper have the same property to a still greater degree, and should be employed in preference to that acid unless they can be shown to have some injurious influence on the tissues from which carbolic acid is free.

### Chemistry.

**The Reciprocal Substitution of Certain Metalloids.**—Boracic acid and oxychloride of phosphorus, if heated together for eight or ten hours at 150°, have been observed by G. Gustavson (*Zeitschrift für Chemie*, vii. 417) to act on each other in the following way:  $B_2O_3 + 2POCl_2 = PBO_3 + PBOCl_2$ . When the reaction is complete, and the mixture distilled in a paraffin-bath, crystals sublime of  $PBOCl_2$ ; a portion of them, however, decomposes during the operation into  $BCl_3$  and  $POCl_3$ . The residue consists of  $PBO_3$ , and is possibly only a mixture:  $2PBO_3 = P_2O_5 + B_2O_3$ ; it is completely soluble in water from which boracic acid crystallizes out, leaving phosphoric acid with a little of the former acid in solution. By ignition this white residue is rendered insoluble in water, but it is taken up by boiling alkalis with the formation of salts of the two acids. The crystalline body  $PBOCl_2$  is very readily formed direct from  $BCl_3$  and  $POCl_3$ , by long sustained sublimation, but splits up into its constituents already at ordinary temperature, though but slowly in that case, with evolution of  $BCl_3$ ; water and moist air immediately decompose it. If heated in a closed tube, it melts at 73°. This compound of two acid chlorides may be regarded as a salt in which  $BCl_3$  in some measure plays the part of a base and  $POCl_3$  that of the acid. If the chlorine be supposed to be replaced by oxygen, we have the body  $PBO_3$  mentioned above. In a similar manner anhydrous phosphoric acid and chloride of boron, if heated together for two or three days at 200°, react on each other:  $P_2O_5 + 2BCl_3 = PBOCl_2 + PBO_3$ .

**Animal Cellulose.**—Since the first discovery of cellulose in animal tissues, by Schmidt in 1845, in *Ascidia mamillaris*, its occurrence under these conditions has been investigated by Löwig and Kölliker, as well as Payen in association with Dumas, Milne-Edwards, and Boussingault. Each of these observers extracted from the tissues a pure substance, containing no nitrogen, and giving numbers that accorded with the formula  $C_6H_{10}O_5$ . More recent observers have cast doubt on the identity of the cellulose from the two sources; while Berthelot, who obtained his material from *Cynthia papillata*, and found the pure

product identical in percentage composition with cellulose, though differing from it in its structure and behaviour with boron fluoride, considered it to be another substance than woody fibre, and gave it the name of tunicine. Schäfer has just communicated to the *Annalen der Chemie*, clx. part 3, 312, the results of an elaborate examination of the entire question. He derived his material from the tissues of *Pyrosoma atlanticum*, *Phallusia mammillaris*, &c., and establishes the identity of their cellulose with that met with in the vegetable kingdom by its possessing the following characteristics:—1. The percentage composition of vegetable cellulose; 2. The striking a violet-blue with iodine after previous treatment with sulphuric acid; 3. The solubility in cupriforous ammonia and subsequent precipitation with acid; 4. The formation of fermentable sugar with sulphuric acid; and 5. Its conversion by forming nitric acid into a nitro-compound which dissolves in a mixture of alcohol and ether, and resembles gun-cotton.

**The Decomposition of Soluble Metallic Sulphides by Water.**—J. Thomsen has been led by the results of his thermo-chemical researches to regard hydrogen sulphide as a monobasic hydrogen acid, with the formula  $H.SH$ , in which the first equivalent of hydrogen only is replaceable in the wet way by sodium or ammonium. Solutions of normal metallic sulphides, like that of sodium, are held to be mixtures of hydrates and sulphhydrates, the sulphur existing in the solution only as a sulphhydrate of the form  $R.SH$ , the radical  $SH$  occupying the position of chlorine in hydrogen chloride. From the analogy of hydrogen sulphide to water, he considered the latter to be a monobasic acid, and  $H.OH$  its rational formula. Many well-known facts support Thomsen's view: a hot aqueous solution of barium sulphide deposits on cooling crystals of barium sulphhydrate and barium hydrate. But, it is contended by H. Kolbe (*Chem. Centralblatt*, iii. 19), the crystals obtained on saturating one volume of strong soda solution with hydrogen sulphide, and adding a second to it, contain nine molecules of water, and they may be regarded either as  $N_2S + 9H_2O$  or, according to Thomsen,  $NaSH + NaOH + 8H_2O$ . If the latter view be the correct one, their watery solution, when heated with potassium sulphovinate, should form ethyl sulphhydrate, not ethyl sulphide. It was found by experiment that along with ethyl sulphide considerable quantities of mercaptan are produced, that the amount of ethyl sulphide was greatest when little water was used, and that the yield of mercaptan was augmented and that of ethyl sulphide diminished by increasing dilution. As the latter sulphide is obtained from even dilute watery solutions, they must of necessity contain a proportion of unchanged metallic sulphide. Thomsen's proposition, therefore, may take this modified form: the soluble metallic sulphides, by their solution in water, suffer a decomposition arising from the fact that the metals of these compounds possess for the oxygen of the water an affinity apparently nearly equal to that which they have for the sulphur, or varying but slightly from it, and in the case of each metal to a degree which has yet to be determined. Thomsen's hypothesis respecting the monobasicity of hydrogen sulphide and of water is therefore erroneous.

**The Occurrence of Inosite in the Vegetable World.**—Inosite was originally found by Scherer in the muscles of the heart, and afterwards discovered by other observers in the lung, liver, kidneys, and other organs of the body. Vohl was the first to meet with it in the vegetable world, in the Leguminosæ; and it has since been shown to enter into the constitution of the plants of other families. Lindenborn in 1867 detected its presence in wine, and Hilger (*Ann. der Chemie*, cix. 3, 333) has now found it to be a normal constituent of the juice of the grape. It was shown by Vohl that during fermentation inosite furnishes, among other products, lactic acid, though which of the two forms of this acid it gave, he did not determine. The point is one of interest, since lactic acid is a normal constituent of muscular tissue, and the theory has been frequently expressed that this lactic acid is derived from the inosite after muscular activity. Hilger states the acid formed from inosite to be para-lactic or, as it is sometimes termed, sarco-lactic acid.

**The Reducing Action of Palladium Hydrogenium.**—The very energetic manner in which black pulverulent palladium, which has been saturated with hydrogen, acts on organic compounds has been noticed by H. Kolbe (*Chem. Centralblatt*, iii. 19). He found, when benzoyl chloride is conducted in the form of vapour in a current of hydrogen over moderately strongly heated palladium, that a considerable portion of the chloride is converted, in the liberation of hydrochloric acid, into an oily body having the odour of oil of bitter almonds. It is unacted upon by dilute soda solution, furnishes but a small amount of a crystallizable compound with bisulphite of soda, and appears to be chiefly benzylic alcohol. If platinum be used in such experiments, no action takes place. Nitrobenzol carried over the palladium in a current of hydrogen is converted into aniline. The author is endeavouring to convert benzoic acid, or perhaps benzoic anhydride, into benzylic alcohol, and acetic acid into ethylic alcohol.

**Native Phosphates of Lime.**—In continuing his classification of the mineral species having this composition, T. Petersen (*Chem. Centralblatt*, 1872, iii. 24) notices the objections raised by Kosmann to considering staffelite a species distinct from apatite, as the investigations of Stein, Sandberger, and himself, indicate it to be. He maintains his previously

expressed view, and, pending the decision of the question of the crystalline form of staffelite, sees in other characteristics of the mineral sufficient cause for considering it an independent species. He finds confirmation of this view in a communication by Maskelyne and Flight on a Cornish mineral which differs from apatite in containing lime carbonate as an essential constituent. The author remarks that irrespective of the amount of water in this mineral, which differs barely from that met with in staffelite, the formula given to the Cornish mineral,  $5Ca_3P_2O_8 + CaCO_3 + 2CaF_2$ , accords closely with the mean composition of a good many staffelites, and this mineral therefore is probably identical with staffelite. The author includes in the name staffelite all those basic lime phosphates of the form  $Ca_3P_2O_8 + xCaH_2O_2$  (where  $x$  is about 1) in which the basic lime is in combination with fluorine or carbonic acid, and all or part of the water of hydration is still present.

### Philology.

Uttaracanda. Versione Italiana per Gaspare Gorresio. Parigi: dalla Stamperia Nazionale, 1870.

SIGNOR GORRESIO has at length completed his elaborate edition and translation of the *Rāmāyaṇa*, according to the recension current in Bengal. The first volume of the text was published in Paris in 1843, and the title-pages of the different volumes curiously illustrate the changes which the twenty-eight years have brought in their course. The first three volumes of the text and the first of the translation were printed in the reign of Louis-Philippe, at the "Stamperia Reale;" the fourth and fifth volumes of the text and the second of the translation, at the "Stamperia Nazionale," from 1848 to 1851; then follow the volumes "dalla Stamperia Imperiale," until this present volume, the last of the translation, which of course again returns to the "Stamperia Nazionale" of its earlier predecessors. It is also very interesting to read by the light of subsequent events the editor's own words in his preface to the fourth volume, published in 1848. He there mourns over Charles Albert's defeat and Italy's ruined hopes, and he adds, "io accarezzava la speranza che questo volume più felice che i primi suoi fratelli dovesse uscire in sull'aurora dell'indipendenza e dell'unione italiana, e portarne impresso in fronte il fausto

segno: il cielo destinò altramente; e il gioia di salutar nascendo l'Italia redenta e unita sarà forse destinata ad un altro fra i volumi che verranno dietro a questo." This last volume was printed just before these hopes were finally accomplished; but as he promises us at some future time two more volumes (the 13th and 14th), on the Aryan civilisation and the early migrations of the race, his words will still come literally true.

The *Uttarakāṇḍa* bears the same relation to the *Rāmāyaṇa* as the Cyclic poems to the *Iliad*. Just as the *Cypria* of Stasinus, the *Æthiopis* of Arctinus, and the little *Iliad* of Lesches completed the story of the *Iliad*, and not only added the series of events which preceded and followed it, but also founded episodes of their own on isolated allusions in Homer, so the *Uttarakāṇḍa* is intended to complete the *Rāmāyaṇa*, and at the same time to supplement it by intervening episodes to explain casual allusions or isolated incidents which occur in it. Thus the early history of the giant Rāvaṇa and his family fills nearly forty chapters, and we have a full account of his wars with the gods and his conquest of Lankā, which all happened long before the action of the poem commences, just as the *Cypria* narrated the birth and early history of Helen, and the two expeditions of the Greeks against Troy; and the later chapters continue the history of the hero Rāma after his triumphant return to his paternal kingdom, and the poem closes with his death and that of his brothers, and the founding by their descendants of various kingdoms in different parts of India.

But the *Uttarakāṇḍa* also resembles the Cyclic poems in their attempts to render the great epic cycle a self-interpreting whole by developing Homer's casual allusions into long episodes. Stasinus filled out the incidental mention of Achilles' attack on Æneas while tending the herds (*Il.* xx. 91), and the killing of Troilus (*Il.* xxiv. 257); and exactly in the same way we have several chapters in the *Uttarakāṇḍa* which seem entirely to have arisen from the natural desire to know the details of some event which the older epic had only glanced at in a passing mention. Thus Rāvaṇa always appears in the *Rāmāyaṇa* as borne by a magic self-moving car Pushpaka which he had won from Kuvera, the god of wealth; the acquisition of this car forms the subject of an episode detailed in chapters ix. xiii. xiv. xv., and we have an elaborate description of the car itself in ch. xv. Similarly the friendship of the monkey-king Bāli with Rāvaṇa is described in ch. xxiii., which is readily suggested by Rāma's friendship with Bāli's rival Sugrīva; and in ch. xxxii. we have a legend to explain why Khara was sent by Rāvaṇa with his mother Sūrapākhā and fourteen thousand Rākshasas to occupy the Daṇḍaka forest. Rāma of course subsequently meets them there, and his victory over them had been described in the *Rāmāyaṇa* itself. There are also some curious passages, where the later poem suggests explanations of apparent incongruities in the older epic. Thus in chs. xxxix. xl. we have a legend related to Rāma by the sage Agastya to account for the stupendous strength of the monkey Hanumat, as it had been described in the *Rāmāyaṇa*. Rāma naturally wonders (as perhaps many readers of the *Rāmāyaṇa* have done since) why a monkey of such marvellous power and prowess had not easily overcome Bāli and secured the throne for his friend Sugrīva. Agastya replies that Hanumat was at that time under a curse from a Rishi, and consequently was not conscious of his own might.

It is well known that there is a Buddhist version of the story of the *Rāmāyaṇa* which gives the earlier portion of the life of Rāma, down to his unjust banishment by his father into the forest, where he lives with his brother Lakshmaṇa and Sītā, who, however, is represented as his sister,

not his wife. Prof. Weber has pointed out the close similarity between the two accounts, even to the incident of Rāma's slippers, which the brother, who remains as regent, places on the throne, when he has vainly tried to persuade Rāma to return from exile before the period prescribed by his father has expired. But the Buddhist legend has no mention of Sītā's rape by Rāvaṇa or the subsequent expedition to Lankā (Ceylon) and the destruction of the ravisher. Prof. Weber has hence conjectured, with some plausibility, that this portion of the story as told in the *Rāmāyaṇa* is of later origin, and may be a reflex of some faint tradition of the *Iliad* derived through Bactria and the Græco-Bactrian settlements in the north-west of India. Prof. Kern has shown that the *Gārgī Sanhitā* (B.C. 50?), in its prophetic history of the Kali yuga, mentions Parāsu-Rāma and the Mahābhārata war, but it is entirely silent as to Rāma the son of Dāsāratha. Perhaps the *Uttarakāṇḍa* may increase the likelihood of the hypothesis, as we here have an addition to the original legend which we cannot hesitate to ascribe to a later author, though Hindu tradition associates it with the sacred name of the inspired bard Vālmīki, just as Proclus says, Οἱ μέντοι ἀρχαῖοι καὶ τὸν κύκλον ἀναφέρουσιν εἰς Ὅμηρον.

Of the date of the *Uttarakāṇḍa* we are entirely ignorant, but it is at any rate older than the *Raghuvansa* ascribed to Kālidāsa (A.D. 200?) if the later books of that poem belong to him. We need hardly mention the *Uttararāmcharita* of Bhavabhūti (A.D. 720), which, though deviating in some particulars, generally follows the same tradition.

The poem itself is decidedly inferior to the better parts of the *Rāmāyaṇa*, and the legends introduced are generally childish in their ideas and ludicrous in their exaggerations. Some, however, are curious. Thus, in ch. xviii., Rāvaṇa is described as violently interrupting a sacrifice which is being performed by King Marutta, and the assembled gods in terror assume different shapes to escape. Indra becomes a peacock, Yama a crow, Kuvera a lizard, and Varuṇa a swan; and each deity bestows a boon on the animal he had chosen. The peacock's tail recalls Indra's thousand eyes; the swan's colour becomes white, like the foam of the ocean (Varuṇa being its lord); the lizard obtains a golden colour; and the crow is never to die except when killed by a violent death, and the dead are to enjoy the funeral oblations when they have been devoured by the crows. In ch. lxiv. there is a curious dispute between a vulture and an owl, each claiming the original ownership of a nest. The vulture affirms that it had belonged to him ever since the earth had been peopled by mankind; but the owl retorts that it had been his ever since the earth had been adorned with trees. Rāma, as umpire, accordingly decides in favour of the owl. This legend seems to have an affinity with the Buddhist fable in M. Julien's *Avadānas*, No. lxxvii., where the elephant, the monkey, and the partridge dispute, under a pipal tree, which is the oldest and most venerable. The elephant remembered the tree when it only reached up to his belly; the monkey when he could reach its top as he sat on the ground; but the bird had himself dropped the seed from which it had sprung! We have a similar story in the *Sindibād Nāmāh* (see Falconer's analysis).

The finest part of the poem is undoubtedly the closing scene of Sītā's life. After her rescue from Lankā, Rāma had only consented to receive her on her passing unscathed through the ordeal of fire; but after his return to Ayodhyā he learned from popular rumours that his people were still unsatisfied as to her innocence. To his own bitter distress he therefore resolves to send her away to the hermitage of Vālmīki; there she bears her two sons, Kuśa and Lava, who are taught by the sage the great epic which celebrates

their father's exploits. Ráma, in course of time, hears of the poem, and when the boys are brought into his presence to recite it, he recognises them as his sons. He then sends for Sítá, and, to satisfy any doubts in the minds of his subjects, he promises to receive her again if she will once more solemnly call the gods to witness that she is innocent. But Sítá's heart was too full; this second ordeal was beyond even her power to submit to, and the poet rose above the ordinary Hindu ideal of women when he ventured to paint her conscious purity as rebelling.

"Beholding all the spectators, and clothed in red garments, Sítá, clasping her hands and bending low her face, spoke thus, in a voice choked with tears: 'As I, even in mind, have never thought of one other than Ráma, so may Mádhaví, the goddess of Earth, grant me a hiding-place. As in thought, deed, and word I worship only Ráma, so may Mádhaví grant me a hiding-place.' As Sítá made this oath, lo! a marvel appeared! Suddenly cleaving the earth, a divine throne of marvellous beauty rose up, borne by resplendent dragons on their heads; and, seated on it, the goddess of Earth, raising Sítá with her arm, said to her, 'Welcome to thee!' and placed her by her side. And as the queen, seated on the throne, slowly descended into Hades, a continuous shower of flowers fell down from heaven on her head."

Both the great Hindu epics thus end in disappointment and sorrow. In the *Mahábhárata* the five victorious brothers abandon the hardly won throne to die one by one in a forlorn pilgrimage to the Himálaya; and in the same way, Ráma only regains his wife, after all his toils, to lose her. It is the same in the later Homeric cycle—the heroes of the *Iliad* perish by ill-fated deaths; and even Ulysses, after his return to Ithaca, sets sail again to Thesprotia, and finally falls by the hand of his own son. But in India and Greece alike this is an afterthought of a self-conscious time, which has been subsequently added to cast a gloom on the strong cheerfulness of the heroic age.

I may add that the name Kapila which occurs in the first book of the *Rámáyana* as that of the divine destroyer of the sons of Sagara, and of which Schlegel remarked in a note to his translation, "de hoc Vishnuis cognomine non habeo quod expromam," is distinctly ascribed to Vishnu in the *Uttarakāṇḍa*, xxxi. 68. Kapila is the reputed founder of the Sāṅkhya philosophy, and is by his followers honoured as an incarnation of Vishnu (cf. Vijnána Bhikshu's *Comm. on the Sāṅkhya Sūtras*, vi. 70); but the appearance of Vishnu under this name in this passage of the old poem seems to prove that the *Rámáyana* in its present form belongs to a date long subsequent to the rise of the Sāṅkhya philosophy. The mention of the name in the *Uttarakāṇḍa*, which is evidently intended to explain its older occurrence, proves the antiquity of our present text.

E. B. COWELL.

**A Grammar of the Latin Language from Plautus to Suetonius.**  
Part I. Sounds, Inflexions, Word-formation. By Henry John Roby, M.A., late Fellow of St. John's College, Cambridge.

MR. ROBY has conferred by this work a great service on all students of Latin, and especially on those in this country. The activity of German scholars in the field, not only of Latin grammar on its formal side, but of all philological study bearing upon it, has been of late both multitudinous and fragmentary, producing a number of works which are virtually elaborate monographs on special departments, but no complete summary bringing the results of modern research into focus. Such a summary, executed by a competent scholar

of independent judgment, is thus a real necessity for all, whether specially interested in the subject or not, who wish to gain, without waste of time, an insight into the present condition of this branch of Latin scholarship. Mr. Roby has neglected nothing which is necessary to the effective performance of such a work: and it should be observed in particular that he has turned thoroughly to account the labours of the most eminent phoneticians, so far as they can be used to clear up the more intricate problems of Latin pronunciation.

This would seem but cold praise for so thoroughly careful and able a book; but in truth at the present time a judicious writer on Latin grammar must feel that his most important task is to arrange and to summarize. A previous generation of philologists, when research was less minute, small difficulties less apparent, and the multitude of facts less obvious in its pressure, could venture more boldly on generalisation: "paupertas impulit audax." Now, the interest of speculation must for a time be put by, until greater certainty is achieved. The apprehension of giving an air of dryness to his work has not prevented Mr. Roby from concentrating his main attention on a clear and accurate exposition of the facts. His views often differ, indeed, from those generally received: but his tendency is rather towards scepticism than fresh construction. He has rigidly limited his field to the investigation of Latin: of Latin, that is, independently, so far as may be, of Sanskrit, Greek, or even the Italian dialects, which, he thinks, offer few results "sufficiently solid to allow one to rest any theories of Latin grammar upon them." This method gains in exactness what it loses in interest. The severe sifting of materials, of which Mr. Roby's book gives evidence, is a merit which deserves the more appreciation as it has been found that Corssen's lists often leave something to be desired in point of accuracy.

Besides the pains taken by Mr. Roby in the verification of facts must be noticed the excellence of his arrangement and the fulness of his lists. The general pathology of the various sounds is treated shortly in the chapter on the laws of phonetic change, their special pathology in Latin in the section on the various letters: an arrangement which saves considerable trouble and repetition. The declensions are properly distributed into two, not into five classes: and the arrangement of compounds in Book iii. according to the syntactical relation of their parts, is both sensible and ingenious. With regard to the lists of compound and derivative words, few readers will probably find them, as the author fears many will, "needlessly full." Such lists are, as he rightly judges, indispensable for the study of Latin formation. In the case of the verbs, Mr. Roby has made out not only a list of the stems (which, if given alone, might have seemed to bind the reader to his arrangement), but an alphabetical catalogue. The index might with advantage have been fuller.

The preface, in which Mr. Roby discusses a number of the moot points of grammar and pronunciation, will probably be found, to general readers, the most interesting part of the work. It will be convenient to follow him, point by point, in his own order. In the excellent section on *v* consonant, p. xxxii, he seems to us, in spite of Prof. Max Müller's letter in the *Academy* of December 15, to have completely made good the view which he has previously defended in these columns: and his treatment of *c* and *g* before *ae*, *e*, and *i* is equally satisfactory. His views on the etymological position of *f*, as expressed both in the preface and in the body of the work, seem more open to dispute. Mr. Roby says (p. xlii):—

"The rare occurrence of *f* in suffixes goes far to show that the sound did not exist in the time when these suffixes assumed shape and use."

It may well be that *-bro* (in *caudela-bru-m*, &c.) is of the same stock as *-erre*, to bear; but if so, they are collateral relatives, and *-bro* is the earlier of the two. Similarly the verbal tense-suffixes *-bam*, *-bo*, &c., the derivative noun-suffixes *-bulo*, *-bili*, the case-suffix *-bi* in *tibi*, *-bis* in *nobis* and *vobis*, *-bus* in nouns, may very possibly have correspondents in Latin (or Umbrian or Oscan) beginning with *f*, but I should be inclined to regard such words with *f* as in a collateral, not a parental, relation to those with *b*: and thus *ama-vi* would not be for *ama-fui*, but it may contain a suffix from the same root as *fui*."

The facts, however, will, we think, better bear the ordinary explanation. Comparative philologists tell us that *f* in Latin mostly represents one or other of the Sanskrit aspirates *bh* and *dh*, the former of which is in Greek generally turned to *φ*, and the latter to *θ*. Stems beginning with *bh* in Sanskrit constantly begin with *f* in Latin: but, as contrasted with the Italian dialects, Latin exhibits a great aversion to *f* in the middle of a word, where it represents Sanskrit *bh* by *b*. The Umbrians could say *Tifernum*, but Rome was built on the *Tiber*: the *Safini* were called by the Romans *Sabini*: *Rufus*, *Alfius*, *Alfenus*, *Orfius*, were preserved as proper names, but *rubere*, *albere*, *orbus*, continued in use as words. Compare *sifilum* and *sifilare* ("quod nos, vilitatem verbi evitantes, *sibilare* dicimus," Nonius, p. 531) with their more usual forms, and the Umbrian *tre-fu* with the Latin *tri-bus*. It may be argued that where *b* in Latin answered to Sanskrit *bh*, it represented it as directly as *f* would have done: but it must be remembered that where the Romans had no objection to *f*, namely, at the beginning of a word, they used it as their representation of the Sanskrit aspirate, and it is therefore reasonable to suppose that they originally used *f* in the middle of a word as well, and subsequently let it degenerate into *b*. Certainly, supposing that they wished to make *fuo* a suffix to a vowel-stem, they could not, averse as they were to an *f* between two vowels, do otherwise than change the *f* into *b*: and then (as *bu* before a vowel was again no favourite with them) omit the *u* and write (say) *ama-bo*. To have written *ama-bi* for the perfect would in some persons have caused a confusion with the future, and in this case therefore the *b* was sacrificed. *Pot-ui*, which has usually been considered, on the analogy of *pot-eram*, *pot-ero*, to stand for *pot-fui*, and therefore be a crucial instance of *fui* as a suffix, is held by Mr. Roby (§ 725) to be equivalent to *potivi* (comp. *potior*, *potiri*). But it seems extremely doubtful whether the forms in *-ivus* and *-ivi*, *-uus* and *-ui*, can be considered as identical, for the ordinary contraction of perfects in *-ivi* is not into *-ui* but into *ii*. *Vacivus*, therefore, and *vacuus*, *posivi*, *posui*, &c. are more probably distinct formations from the same stem.

It is very difficult to obtain evidence on the pronunciation of *s*. Mr. Roby differs from Corssen as to its having had a soft or flat sound between vowels: and perhaps the balance of argument may be said to be on his side. But we venture to think that Curtius' account (quoted p. lvi) of the lengthening of vowels before *-ns* is less open to the charge of unreality than Mr. Roby supposes. *N*, being itself vocal, will lengthen a preceding vowel if it can assert itself: it does so to a certain extent even when followed by a mute, and to a greater extent in proportion as it is less checked by a following consonant. Compare the quantity of *bet*, *bent*, *bend*: and again that of *yes*, *pence*, *pens*. By lengthening the preceding vowel *n* often runs a risk of destroying itself, unless protected by a strong mute: thus *Gänse* became *geese*, *γῆνς γῆνς*. This, which is virtually Curtius' explanation of the matter, seems more natural than saying with Mr. Roby that "the *n* (in *-ns*) was scarcely audible, but that to compensate for this the Romans lengthened the preceding vowel . . . to signalise the fact of the syllable being more than the vowel + *s*." Indeed, the process usually described as "compensation" deserves altogether a

more minute analysis than it has generally received at the hand of grammarians.

In treating of the origin of *ss* (p. lvii, foll.) Mr. Roby is probably quite right in opposing Corssen's theory that in the case of supines like *tonsum* the process of contraction was from *tond-tum* through *tons-tum* and *tons-sum*, as a much simpler explanation can be given, that *tond-tum* became first *tond-sum* and afterwards *tonsum* (p. lx). The combination *st* is no doubt a stable one in Latin, and seldom passes into *ss*. Mr. Roby says never; yet it is difficult to go so far with him as this, and say that the common superlative ending *issimus* stands not for *is-timus* but for *ior-imus* (see § 755): that *levissimus*, for instance, was contracted from *levior-imus*. Is there, in the first place, any instance of such a contraction as *levis* for *leviōr* or *leviōs*? Such abbreviations as *victrix* for *victorix* are hardly parallel. And, secondly, the progressive assimilation of *st* into *ss*, to which Mr. Roby strongly objects, seems to have taken place in the participle *iussus*, formed like the perfect *iussi* from the stem *ius* (*iustus* retaining a different form to distinguish it from the participle). So *pustula* has another form *pusula* (= *pussula*?), which, had it been formed from the stem *pus* + *ulo*, would have been *purula*. *Assus* (dry or roasted), compared with the substantive *assura*, looks very like a participial formation, and, if so, must stand for *as-tus*, the stem being *as*, which in *arere* and *aridus* follows the ordinary rule of change from *s* to *r*\*. Mr. Roby extends his theory to such forms as *acer-imus* and *facillimus*, which he thinks stand not for *acer-timus* and *facili-timus*, but for *acerior-imus* and *facilior-imus*. But that *acerimus* should stand for *acer-simus* (= *acer-timus*) is not stranger than that *torreo* should stand for *torseo*: perhaps *facillimus* and *simillimus* are formed directly from *facul* and *simul*: but, if not, it is easier to imagine them developed out of *facil(i)-simus*, *simil(i)-simus*, than by long degrees out of *faciliorimus* *similiorimus*. Mr. Roby, indeed, contends that *t* does not change to *s* after a single *l* or *r*, but only after a double one: yet it is doubtful whether the first syllable of *pul-sus* (comp. *pēpul-i*) be not the genuine form of the stem. Compare *perculi* with *percello*.

On the question of the division of words into syllables, Mr. Roby departs from Madvig's doctrine that a consonant between two vowels belongs to the second vowel, holding that the tendency of Latin pronunciation is "to unite a consonant with the preceding, not with the following, vowel." Space will not allow of our entering into the wide-spreading minutiae of such a question, when there are other points, more interesting and definite, awaiting consideration: but it may be remarked that from the nature of the case it is hardly conceivable that uniformity was observed in the matter, and, further, that arguments from prosody and etymology are, in a case of this kind, apt to be fallacious. For instance, the fact on which Mr. Roby lays so much stress (§ 273), that vowels are often lengthened to compensate for the extrusion of consonants following (*exa-men* = *exag-men*, &c.) does not prove that the *m* "belonged" to the preceding vowel, but that in the pronunciation of the whole word it had more weight than the *g*.

The observations on noun-stems in *-e* and *-i* (preface, pp. lxxxii-lxxxviii) are among the most valuable in the book, and deserve attentive study as contributing much towards the solution of a difficult problem. The *-e* and *-a* verbs with perfects in *-ui* and supines in *-itum* present anomalies in dealing with which we think that Mr. Roby goes too far in his attempt to reduce them to uniformity. He assumes

\* Merguet, in his able tract, *Die Entwicklung der Lateinischen Formenbildung*, starts an ingenious hypothesis that *issimus* stands for *i-sti-mus*, *-sti-* representing the root *-sto-*, which appears in forms like *ἱστίος*, *μέγιστος*, &c.

(if we rightly understand §§ 688 and 693) stems in *-ē* and *-ā* throughout the verb (except apparently in the perfects of the *-ā* stems), so that he would make *monui* = *monē-vi*, *monī-tum* and *domī-tum* = *monē-tum* and *domā-tum*. It seems to us safer to assume consonant stems for the perfects (*mon-ui* not *mon(ē)-vi*, &c.), whatever may be the case with the present stems; and with regard to the latter, while the question of the *-e* stems may be put on one side as undecided, it is surely going too far to set up hypothetical stems in *-ā*, with the exception, of course, of *dā-tus*, *rā-tus*, *sā-tus*, and *stā-tus*. Wherever *a* appears in words like *crepare*, *sonare*, &c. it is long, as in the genuine *-ā* verbs both in Latin and Greek: and it is quite consonant to the analogies of the Latin language (which produced most of its *-ā* verbs on its own ground) to suppose that consonant stems like *ton-*, *son-*, *crep-*, &c. were lengthened by a long *ā* in the present and those parts of the verb which follow it, while preserving their consonantal character in the perfect and supine. Little can be made out from the supines in *-itum* as to the character of the present stem, as these supines, answering to perfects in *-ui*, are found affixed to stems unquestionably consonantal (*frem-itum*, *gem-itum*, *strep-itum*, *vom-itum*). Some twenty are attached to *-e* verbs: of these some seem to have been adopted to avoid confusion with other verbs: \* most of the rest are appended to stems characterized by *l*, *m*, *n*, or *r*.

Some remarks are necessary on Mr. Roby's treatment of the locative case in his section on inflexions. He says (p. 112): "Another case, distinguished in some other languages, called the *locative*, is in Latin always the same in form as either the genitive, dative, or ablative. Nouns of the first class (*-a*, *-e*, and *-o* stems) have the genitive singular (except in the pronouns), the locative singular, and the nominative plural (except in a few *-e* stems) alike. . . . Nouns of the second class (*-u*, *-i*, or consonant stems) have the locative usually the same as the ablative." Accordingly, *mensae*, *pueri*, *boni*, *animi*, *belli*, *equi*, are marked in the tables as genitive and locative: *nubi* as locative and dative: *rate*, *igni*, *imbri*, with their plurals as locative and ablative, *sus*, *artus*, and *gradus* being denied locatives altogether. There seems to be a want of clearness about this arrangement which might have been obviated had a distinction been taken at the outset between words locative in form and words locative in meaning: or (so to speak) between dead and living locatives. For words which are locative both in form and meaning, which have, that is, the proper locative ending *-i* and its meaning at the same time, are limited both in number and signification. They may be arranged as being words either of place, as *Romae*, *Carthagini* (special), *ruri*, *domi*, *peregrini* (general), or of time (*tempori*, *die quarti*, *postridie*), or of action (*belli*, *militiae*). But in what author are *mensae* or *pueri* used as locatives (= *in mensa*, *in puero*), as any reader would infer from Mr. Roby's declension-tables that they were? Again, to come to the *-i* and *-u* stems, *igni* and *imbri* require the preposition *in* to give them a locative sense, and are therefore as much ablatives as *campo* or *mensā*: nor is *nubi* more

* <i>Habitus</i>	} might have been confused with	{ <i>aptum</i> ,
<i>iaciturus</i>		
<i>licitum</i>		
<i>meritum</i>		
<i>tacitum</i>		
<i>territum</i>		
<i>tutium</i>		
<i>veritum</i>		<i>versum</i> .

The rest are *abolitum*, *caliturus*, *cariturus*, *doliturus*, *miseritum*, *monitum*, *solutum*, *valiturus*, *libitum*, *nociturus*, *placiturus*, *puditum*. We quote from Mr. Roby's lists.

a locative than *gradui*. And in any sense in which *equus* possesses a living locative, *sus*, *gradus*, and *artus* possess one, though none is allowed them by Mr. Roby. It would have added to the clearness of the grammar to have stated this difference accurately. H. NETTLESHIP.

### Notes and Intelligence.

Mr. A. Burnell is reported to have completed his catalogue of the large collection of Sanskrit manuscripts at Tanjore, undertaken at the order of the Madras government.

It is reported from Lahore that Dr. Trumpp, who has been entrusted by the Indian government with an English translation of the *Adi Granth* of the Sikhs, is about to return to Germany, there to complete a work so eagerly looked forward to by all who take an interest in the growth of Oriental creeds.

Bábú Rágendralála Mitra has issued the third part of his *Notices of Sanskrit Manuscripts discovered in the Bengal Presidency*, thereby completing the first volume. This fasciculus contains Nos. CCCLXII–DXIX; besides a classified Index of the titles of works contained in this volume.

A new magazine has been started at Geneva, under the title—*Atsume gusa, pour servir à la connaissance de l'extrême Orient*.

Mr. Whitley Stokes, Secretary to the Government of India in the Legislative Department, has presented to the Bodleian a copy (recently made at Benares) of the *Kaṇṇika-sūtra* of the *Sāma-vāda*. It has been ascertained that no other copy of this sūtra exists in Europe. Mr. Stokes has also presented to the University Library, Cambridge, a Persian manuscript containing the *Qaṣṣids* of Nazrī of Naishāpūr, the *Divān* of the same poet, and the largest collection yet found (about 800) of the celebrated *Quatrains* (*rubā'iyāt*) of Omar Khayyām, the astronomer-poet of Persia.

### Contents of the Journals.

*Journal Asiatique*, No. 66.—Personal pronouns in Egyptian, by M. G. Maspero.—Chapter of the preface of the Farhangī Djehangiri on dactylometry, by M. St.-Guyard.—Ottoman bibliography, by M. Belin.—The *Fetwa* of Ibn Taimiyyah on the Nosairis, published for the first time with a new translation, by M. St.-Guyard.—Letter to M. le Baron de Slane on three coins of generals of the Khalīf Omar, by M. de Saulcy. Notices:—Querrey's *Droit musulman*, by M. Barbier de Meynard.—The Catalogue of the Arabic MSS. of the British Museum; the Bengal Notices of Sanskrit MSS.; and Lewin on the Hill Tribes of Chittagong, by J. M.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 44.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The next number will be published on Thursday, March 28, and Advertisements should be sent in by March 25.*

## General Literature.

**The Works of John Hookham Frere.** 2 vols. Pickering.

JOHN HOOKHAM FRERE was born of good and ancient lineage in 1769, and died in 1846. His life of seventy-seven years may be roughly divided into four chief periods. The period of youth was passed by him at Eton and Cambridge. In 1796 he entered public life as a friend of Canning, whom he succeeded in the Foreign Office on Canning's removal to the Board of Trade in 1799. In 1800 he was appointed envoy to Portugal; afterwards in 1802 he undertook the functions of envoy at Madrid, where, having failed to maintain the full confidence of the government, and being superseded in his post by Lord Wellesley, he abandoned his public career in 1809, and retired into a privacy from which he never again emerged. This date closes the second period of his life, to which belongs a good portion of his most famous literary productions, especially his share in the *Anti-Jacobin*. The third period embraces the years of his residence at Roydon, and of his marriage with Lady Erroll. In literature it is distinguished by the composition of *King Arthur and His Round Table*, the only work of complete originality which Frere produced. At the end of 1820 he left England, never to return to it for any lengthened stay. The last twenty-five years of his life were passed at Malta, which he visited at first for his wife's health, and which he never felt the inclination afterwards to quit. To this fourth period belong the translations of Aristophanes and the *Theognis Restitutus*, on which his literary fame is founded. On the whole, after reading the life of Frere, we are tempted to wonder at the small amount achieved when compared with the magnitude of promise—at the disproportion between the leisure enjoyed and the work done in it—at the richness of faculty and the comparative poverty of result. His biographers apologize by saying, what is true, that "he wanted the stimulus of ambition or of necessity to write, whilst his extreme fastidiousness disinclined him to regard anything he composed as finished." But this will not account for the phenomenon. The real truth is that the individuality of Frere was greatly inferior to his faculty as a *littérateur*. His taste was excellent, his command of language almost unbounded, his sense of humour considerable, his critical instinct delicate, his reasoning powers acute. But he had no real creative power; thoughts and emotions did not force themselves upon him and require expression; invention was neither a joy nor an imperative necessity to him. His real strength lay in translation; his taste and sympathy and wealth of diction made him a master in that department. Nor was he unsuccessful in such occasional verses as the political and social circles of London at that time highly relished—though here it must be admitted that at times he made mistakes of taste and judgment, as in the case of a stupid poem upon Landor, vol. i. p. 271. But

VOL. III.—NO. 44.

from all the higher regions of poetical invention he was excluded, not indeed by indolence, or by fastidiousness, or by want of ambition, but by want of special genius! The great exception to this criticism is the poem of *King Arthur and His Round Table*, written under the pseudonym of "Whistlecraft." In this poem, which is avowedly the precursor and model of Byron's *Beppo*, Frere invented a new style, and gave a humorous complexion to the octave stanza of Fairfax. Nothing stronger in his praise can be spoken than the simple fact that without "Whistlecraft" the world would probably have never known *Don Juan*. But Frere's talent could not carry him beyond the creation of the form. He had nothing particular to say. His poem was not a romance or a satire, an ingeniously constructed comedy or a political allegory. It was a tale of knights and giants in an age when chivalry was so dead that nothing could be gained by laughing at it. People naturally looked for some object in the poem, for some thread of interest or meaning underneath its veil of exuberant phraseology and mask of fun. They would not accept it as a simple burlesque: perhaps they might have been ready to do so, had the scene and characters been modern and familiar; but *Monks and Giants* failed to arrest their attention. Therefore Frere abandoned the poem at the end of the fourth canto. His own view of the purport of the burlesque is admirably expressed in a passage quoted at p. 158 of the *Memoir*. The quaint wit, the wealth of language, the power over metre, first displayed in all their fulness by the pseudo "Whistlecraft," were destined to do the world nobler service in the translation of Aristophanes. There thought, invention, meaning were supplied by the Greek poet. Frere did what no man but Frere could do: he gave an adequate expression in the English tongue to all the many-sided moods of his great master.

The full publication of Frere's versions of the *Frogs*, the *Acharnians*, the *Knights*, and the *Birds* of Aristophanes, together with his Essay on Aristophanic translation, is an invaluable contribution to English literature. Of all Athenian poets, Aristophanes is the one who brings us most closely into contact with the facts of actual Greek life. To understand his allusions, and to appreciate the point of his situations, requires a mastery over antiquarian details, and a sympathy with the spirit of the ancient world, which are rarely to be met with among modern students. At the same time, the imagination of Aristophanes is so gigantic, his machinery so huge, his humour so audacious, the scope and purpose of his comedy so profound, that no one but a poet by nature can hope to grasp his meaning in its fulness. Scholars and critics and historians of literature have failed where Frere has succeeded with the facility of inborn mastery. His command of the universe of Aristophanes is nowhere shown more vividly than in the introductions and interpolated explanations by which he assists the imagination of his readers. These place the student at the proper point of view, illuminating the history and opinions of the time, indicating the drift of the poet's conception, and connecting his inventions with the realities they adumbrate. Then follow passages of light elastic verse, in which the lyrical beauty, the *buffo* garrulousness, the satiric pungency, the comic absurdity of Aristophanes, are successively revealed through the Cœan gauze of inimitably sympathetic translation. Avoiding on the one hand the dulness of *faithful translators* who try to render word for word, and on the other the specious parade of *spirited translators* who distract the mind by tasteless introduction of modern phrases, Frere realises the ideal of the *lawful and true translator*, which he has so ably set forth in his article on Mitchell. There he says: "The language of translation ought, as far as possible, to be a pure, impalpable, and invisible element

the medium of thought and feeling, and nothing more; it ought never to attract attention to itself." To prove from his version of the *Birds*—which of all the comedies of Aristophanes best lends itself to reproduction, owing to its universal and highly poetical character—how Frere has applied in practice his own canons of criticism, would be an easy and a pleasant task. We must, however, leave this pleasure to the readers of his book; for to quote from a work so connected, and of so consummate excellence, is nothing but to mutilate. Yet if one example of Frere's style must be given, let us take the song which the hoopoe sings to lure the nightingale from her thicket (p. 150):—

"Awake! awake!  
Sleep no more, my gentle mate!  
With your tipsy tawny bill  
Wake the tuneful echo shrill,  
On vale or hill;  
Or in her airy rocky seat,  
Let her listen and repeat  
The tender ditty that you tell,  
The sad lament,  
The dire event  
To luckless Itys that befell.  
Thence the strain  
Shall rise again,  
And soar amain,  
Up to the lofty palace gate,  
Where mighty Apollo sits in state  
In Jove's abode with his ivory lyre,  
Hymning aloud to the heavenly quire;  
While all the gods shall join with thee  
In a celestial symphony.  
(*A solo on the flute, supposed to be the nightingale's call.*)  
*Peis.* Oh, Jupiter! the dear delicious bird!  
With what a tone she swells and falls,  
Sweetening the wilderness with delicate air."

In all his translations, Frere was not so successful as with Aristophanes. The simple brevity of *Theognis* and the exquisite art of Catullus are better suited to a different method of work—to that close rendering of form and phrase, for instance, of which Rossetti has given masterly specimens in his translations from Villon and the early Italian lyrists. Yet if we examine closely the whole texture and composition of the *Theognis Restitutus*—a biographical sketch and critical commentary, in the midst of which the translations from that poet are embedded—we find a new illustration of the peculiar qualities of Frere's genius. In this remarkable work of combined imagination and scholarship the fragments of the Megarian moralist—about 1389 lines, reckoning by Bergk's collection—are arranged for the first time in a connected order, so as to illustrate the supposed biography of the poet, and to throw light upon the history of Greece under the despots. It is just in such a work that Frere's powers showed to best advantage. His fancy, which needed an external stimulus, working in combination with his acute reasoning faculty and with his great erudition, enabled him by a kind of critical magic to construct a romance out of the *disjecta membra* of one who commonly passes for the driest of moralising poets. It may be doubted whether Frere has rightly stated or brought into sufficient relief the relations of *Theognis* to Kurnus, or whether some of the elements which he regards as purely autobiographical may not have had their origin in the fashions of the Dorian *Syssitia*. Anyhow, as the Italian proverb runs, the whole *se non è vero, è ben trovato*.

Thanks should be rendered to the editors for the complete and faithful execution of their work. The Memoir may indeed appear too long, especially in its excursus upon Spanish affairs (pp. 57–137), and in its quotations from an article of Mr. Charles Norton—an American critic, who is far from underrating Frere's original genius. But all the details about the life of this highly cultivated gentleman in his

elegant retirement at Malta—the model, we may say, of an intellectual and aristocratic existence that has almost passed away—will be read with great interest by those who care to remember what the Englishmen of the beginning of this century were.  
J. A. SYMONDS.

**History of the Ragusan Drama.** [*Historia Dubrovacke drame.*] By Professor Arnim Pavich; edited by the South Slavonic Academy. Agram, 1871.

FROM the beginning of the sixteenth to the middle of the eighteenth century Dalmatia has been the centre of a remarkable movement in Slavonian literature with which the east of Europe and even the Slavonians themselves long remained unacquainted. To take only one example, the famous Mickiewicz omits all mention of it in his *Course of Slavonian Literature*. The history of this literary movement has only begun to be studied seriously within the last twenty years by the Slavonian *savants* who have their centre at Agram; and the results of their studies have amply demonstrated that the Croatian people do not deserve the reproach of barbarism which has been very unjustly addressed to them. The chief focus of these researches is at present the South Slavonic Academy of Agram, which, founded in 1867 under the auspices of Bishop Strossmayer, has ever since displayed a praiseworthy and fruitful activity. It has applied itself especially to the task of bringing to light the works of Dalmatian writers, some of which can only be met with in editions of great rarity, while a few have never been published at all.

The literary language in which these productions are written is a Slavonic dialect, identical with the present Croatian, if we allow, that is, for the variations to which a living language is subject in the course of time, and for the special influence exercised by the dominant Italian language in a part of Dalmatia. The Croatian dialect itself tends more and more to approximate to the Serbian, so far as its literary use is concerned, and at the present day a difference in their alphabets is all that separates the two idioms (or what pass for two), as is proved by the fact that certain works are printed in both alphabets, as, for instance, the Bible published by M. Danicich, at the expense of the Bible Society, which has two different editions printed in different alphabets from a uniform text.

There are no signs of national literary activity in Dalmatia before the fifteenth century. A few documents and the poetical genius of the Slavonic race make it probable that the country always possessed some popular poets like those belonging to other Slavonic tribes, but the refinements of a civilisation borrowed from Venice and Italy led to the neglect of the popular muse. In the fifteenth century, under the influence of the renaissance, the literary movement declared itself suddenly and almost simultaneously at Spalato, at Ragusa, and in some of the islands bordering on the coast. The movement was exclusively poetical, and prose composition was still neglected. Most of the poets who made their appearance first at Spalato, towards the end of the fifteenth and beginning of the sixteenth century, wrote indifferently in Latin, in Italian, and in their native tongue, which they call sometimes Illyrian (*illirski*), sometimes Slavonian (*slovinski*).<sup>\*</sup> In the sixteenth century the literary school of Dalmatia established its head-quarters definitely at Ragusa (Dubrovnik). Ragusa, the Slavonian daughter of the ancient Epidaurus, was then one of the most

<sup>\*</sup> Even at the present day in Dalmatia the Austrian authorities affect to call the Croatian language *lo slavo*. The Dalmatian peasant, if he is asked what language he speaks, answers readily: *Govorim naski*, "I speak our language."

flourishing cities on the basin of the Mediterranean; her vessels ploughed the seas, she maintained diplomatic relations with Hungary, Turkey, and the Italian republics; Venice and Genoa were her rivals, and like those great commercial cities she had an aristocratic and wealthy population fond of pleasure and all the elegancies of life. In such a centre the theatre was sure to be cultivated with enthusiasm. Accordingly, in the course of two centuries we find no less than twenty-eight known dramatic poets, without counting anonymous authors; and M. Pavich, the author of the work we are considering, analyses no fewer than 116 dramas written during this period. Most of these are still in manuscript, and are to be found in the Library of Agram, and in some public and private collections in Dalmatia; 76 of the dramas rescued from oblivion by this patient compiler are by authors now unknown.

M. Pavich has divided his work into four parts: in the first he examines the dramatic school of Spalato and the island of Hvar (called in Italian *Lesina*); in the second, the Ragusan drama of the sixteenth century; and in the third and fourth, the Ragusan drama of the seventeenth and eighteenth centuries.

It is rather difficult to follow the author through the confused and slightly disjointed mass of analyses on which he has expended so much industry. One fact which the whole of his book brings into relief is the immense influence of Italian upon Dalmatian literature. The first works which he mentions at Spalato are only imitations of Italian authors long since forgotten, Feo. Belcari, Antonio Aralda. They are a kind of mystery or religious drama, to which, when the Italian original is missing, it is easy to find parallels in other European literatures, as, for instance, in the French piece *Débat du corps et de l'âme*; a subject, by the way, which had already been treated in Czech literature in the middle ages. Certain stage directions added to the manuscript lead us to suppose that the pieces were acted either in the principal church or in the open market-place of the town. The rhythm of these first attempts is clumsy, and the verse consists of eight syllables. Some of the dramas are long, containing as many as 2000 lines, and, as may be supposed, the dramatic interest is sufficiently slender; the laws of probability are not much regarded; an angel recites the prologue and the epilogue, which bears some resemblance to the end of a sermon. Here, for instance, is the epilogue of a piece on the history of Joseph and his brethren; it is the angel who speaks:

"You who have been here to-day,  
And have seen the deeds of Joseph,  
May God give you his blessing,  
And [entertain] you ever in joy,  
And forgive you your sins,  
And give you paradise joys,  
In this world a good condition,  
In that the state of paradise."

The subject of another piece is the Annunciation of the Virgin Mary; the Sibyls play an important part; angels, Lucifer, and Leviathan appear; some parts recall an Italian piece by Belcari, others are altogether original. In another drama St. Stephen, who recites the prologue, indicates clearly where the representation is being held: "Good people of Hvar, you who have come into my church, listen to what I am going to say." The church is mentioned in the same way in another drama on the martyrdom of St. Cyprian. On the manuscript of *The Martyrdom of St. Lawrence* there is the following note in Italian: *Al dì 15 di Agosto 1614 fu recitata in città vecchia la prima parte; così pure tutta intiera li 16 al giorno di San Rocco fu recitata in publica adunanza.*

According to M. Pavich the general tone and style of

these pieces is what differs most from corresponding Italian works; one feels, he says, that while these are written for aristocratic circles, the Dalmatian pieces are intended for the people; the angel of the prologue often expresses a hope that God will cause the crop and vines to prosper.

The most original drama of this period is due to a writer named Lucic, and represents the adventures of a young Christian girl carried off by the Turks and happily rescued; the piece is thoroughly national, and besides the usual love intrigue we find in it interesting details relating to the local manners. It is called *Robinja* ("The Slave").

In the Ragusan period, properly so called, religious dramas are less numerous, and the form is more carefully studied; they are written in distichs, which rhyme at the end of the line and of the hemistich—

"Blazene dusice | hodite vi k meni  
iz viečne tuzice | u pokoj blazeni."

"Happy souls, come to me  
From eternal sorrow to a happy peace."

This is the favourite measure of the Dalmatian poets, and presupposes a rich and very flexible language. It appears from a prologue that these dramas were represented in the open air.

Secular or profane tragedy began at Ragusa with translations. Some pieces are called by ancient names, such as *Hecuba*, but on examination they prove to be founded on Italian imitations. In some cases the Italian original is unknown, and the learned had a very delicate problem to resolve, whether, namely, we were in the presence of a piece translated from some ancient play since lost. This hypothesis does not appear probable to M. Pavich. Amongst translations of well-known Italian dramas we may quote Tasso's *Aminta* and the *Pastor Fido* of Guarini. The taste of the Italians at that time for Pastorals is well known, and several Ragusan poets attempted flights in this style upon their own wings. Amongst those who distinguished themselves in this way the names of Vetranich, Naljeskovich, and others, are cited; their subjects are sometimes borrowed from Greek mythology, sometimes from the imagination of the author; they are generally short dialogues in graceful and poetical language.

At the same time, other poets tried their skill in original comedy. Some of their attempts are of an elementary simplicity, others are interesting for the study of local manners, but the dialect is hard to be understood even by the descendants of the ancient Ragusans; it bristles with macaronic Italianisms, and there are occasional traces of the obscenity which disfigures the Italian comedy of the period. These pieces were acted by companies of young people and amateurs; some of them are in prose.

In the seventeenth century the greatest of the Ragusan poets makes his appearance, Gundulich, whom the Italians call Gondola. He is chiefly famous for his long poem on the *Osmanide*, which has caused him to be compared to Tasso and Ariosto. The language reaches its highest perfection in his works. Amongst his dramas *Ariane* is the most admired, especially the choruses, which are excellent as lyrics; it is imitated from an Italian opera of the time, and other "classical" pieces are also Italian reminiscences. The only really original piece by Gundulich is an allegorical pastoral in honour of Ragusa. The contemporary and rival of Gundulich, Palmotich (Palmota), the author of a great epic poem on Christ, shows some *naïveté* and talent in his attempts at original tragedy. The dramatic element is what his works are most deficient in; they are narratives in dialogue, for which Tasso, Virgil, Ovid, &c. furnish the subjects. The author also borrows largely from Ariosto (especially in his use of the marvellous); his works are

interspersed with songs and dances, and, when the occasion offers, with flattering allusions to the glory of the writer's country.

In 1666 the city of Ragusa suffered from an earthquake which greatly affected its prosperity, and the theatre shared in the common decline. From that fatal date down to the fall of the republic (1806) we find only nineteen dramas, and these of little merit. M. Pavich analyses them conscientiously, and we cannot but be grateful to him for his labour, but we will not abuse the reader's patience by dwelling on this period of decadence. M. Pavich concludes by enumerating the names of eight societies of amateurs who used to give representations in Ragusa; their titles resemble those borne by the Italian academies. In taking leave of this meritorious and instructive work we must express a hope that it will be utilised by all future historians of the theatre, and that some Dalmatian *littérateur* may be found to publish an Italian translation (or abridgment) which would place it within the reach of the European public.

For the rest, most of the dramatic works analysed by M. Pavich will be published in the course of a few years by the Academy of Agram, which has already edited three volumes of the ancient authors of Dalmatia, and is still continuing their publication.

LOUIS LEGER.

**English-German Lexicon.** [*Englisch-Deutsches Supplement-Lexikon*, als Ergänzung zu allen bis jetzt erschienenen Englisch-Deutschen Wörterbüchern, insbesondere zu Lucas. Von Dr. A. Hoppe.] Berlin: G. Langenscheidt.

AN exhaustive English dictionary, or at least a word-list with examples, is one of those unwritten books some vision of which has probably floated before the eyes of every student of our tongue. At first sight it does not seem that such a compilation presents any very overwhelming difficulties, but further consideration shows that to form a verbal key to a literature so large as ours is well nigh an impossible achievement. The range is so vast, and the new words which trade, science, and, more than all, the newspapers are introducing day by day are so many, and for the most part so uncomely, that a man must be possessed not only of gigantic working powers, but also of an immense and peculiar range of thought and taste to be able to grasp them so as to give a fairly trustworthy interpretation. We do not believe that such a work can ever be thoroughly accomplished; but that some parts thereof that are at present neglected should be undertaken is a bare necessity if men are to continue to understand what they read.

A foreign word-hunter has some advantages over one who has spoken our language from childhood. He at once catches a new word, because, if it be not in his dictionaries, it is almost sure to be unknown to him, whereas to the Englishman it will probably be far more familiar than many of those classic compounds which are in all the standard authorities from Johnson downwards, but are hardly ever heard out of them, except when some half educated person is anxious to make an impression by the fineness of his diction.

Dr. Hoppe has undertaken to do for German students of English what no Englishman has as yet performed for his own countrymen. He has read, as we suppose, pencil in hand, the writings of most of our popular novelists and other books of light literature that are not works of fiction, and has marked the uncatalogued words, reduced them into alphabetical order, and given specimens and his own interpretation of each. Books are not the only field in which this careful gleaner has wandered. *The Times*, *The Daily Telegraph*, and *The New York Herald*, are also quoted as authorities. The motto on the title-page,

"All is fish that comes to net,"

fully describes the nature of the collection. Nearly everything Dr. Hoppe's net has brought to land has been worth catching. Perhaps indeed there is nothing in the book that may not be useful to a foreigner. Some few of the words, however, seem out of place, from the fact that the special meaning for which they are inserted here differs by so slight a shade from the ordinary one given in all the dictionaries. Take for instance BELT in its secondary meaning of a belt of trees. We have it defined thus: "Auch ein runder, rings von Bäumen eingeschlossener Platz in einem Gehölz," and its use is further illustrated by quotations culled from the writings of Dr. William Howard Russell and the author of *Guy Livingstone*. It seems odd also to meet in a dictionary of words with names of persons and places, such as Pall Mall, Beau Nash, Petticoat Lane, Lindley Murray, and Palmetto State, but the information given under each of these and their companions is undeniably accurate and useful. These and the like redundancies, if they be indeed blemishes, are errors on the right side, and will readily be excused by those who object to them, occurring as they do at rare intervals among a very large mass of useful and minute information.

No slight service has been done by reducing so large a mass of stray words into alphabetical order. Had Dr. Hoppe contented himself with picking his recruits out of the mob and forming them into an orderly regiment, we should have thanked him, but he has done far more: he has given us a long array of useful examples and a series of explanations singularly free from error. EDWARD PEACOCK.

#### TO THE EDITOR OF THE ACADEMY.

SIR,—In a late review of the very useful little book which has been brought out by Professor Seeley and Mr. Abbott, *English Lessons for English People*, you call particular attention to the chapters on Prosody. I have been reading these with some care, and while agreeing with much and finding much to admire, here as in the rest of the book, I venture to think that their statement of the laws of metre is in some points open to criticism. Not to encroach too much on your space, I will confine my remarks to the consideration of the irregularities admissible in the English Heroic Metre. The typical form of this metre is a line of ten syllables, with the accent falling on each even syllable, each pair of syllables making a so-called iambic foot; the pause falling at the end of the line, and each foot ending at the end of a word. But a long series of lines formed precisely on this model would be found intolerably monotonous. The poet, therefore, seeks to vary it, both in respect to the number and accentuation of the syllables and in respect to the pause and break. Of this last mode of varying the rhythm I shall not speak, as it is treated with sufficient fulness in the *Lessons*. I proceed to consider the other ways in which variety is produced.

A. Variation in the number of syllables. Perhaps the irregularities under this head might be more simply classified as follows:—

(a) Variation by excess.

I. The addition of a superfluous syllable or syllables at the end of a foot.

1. Usually the final foot (the so-called *female rhythm*), as—

That durst | dislike | his reign | and me | *prefer* | ring.  
To you | our swords | have lead | en points, | Mark *An* | tony.

2. More rarely after other feet, as—

Except | immor | tal *Cæ* | sar, | speaking | of Brut | us.  
Took it | too *ea* | gerly— | his sol | diers fell | to spoil | .

Where there are two superfluous syllables, the first syllable is more or less slurred,

II. The interpolation of a syllable within the foot.

1. Preserving the distinct sound of the extra syllable, as—

With *impe* | tuous | recoil | and jar | ring sound | ,  
The sound | of man | y a *heav* | ily gal | loping | hoof | .

2. Slurring the extra syllable, either within a word, as—

Whom *reas'n* | hath e | qualled, force | hath made | supreme | ,

or at the end of a word before a following vowel (*elision*), as—

Towards thee, | *I* intend, | for what | I have | misdone | .

Also where the same sound is repeated, we find elision in Milton, as—

Justly yet | despair | not of | his fi | nal par | don, (S. A. 1171)

and possibly in the following—

In e | qual ruin | into | what pit | thou seest | .

Sometimes it may be doubted whether we should explain the scanning of a line by the supposition of an elision or slurred syllable, or of a superfluous syllable at the end of the foot or an extra syllable in the foot. Thus, in the line—

Of riot | ascends | above | their lof | tiest towers | ,

while there is no doubt of the slurring in the last two words, *riot* may be either treated as a monosyllable or as a dissyllable, whose second syllable is either metrically superfluous or is to be joined with the following word and make a trisyllabic foot. The same explanation is applicable to the word *ruin*, above.

(b) The next variation is that produced by *defect* in the number of syllables. This is well treated by Mr. Abbott in his *Shakespearian Grammar*, but hardly touched on in the *Lessons*. It is of course more common in dramatic than in narrative poetry, but I am not sure whether Milton has not employed it at times, e.g.—

Shoots | invis | ible vir | tue e'en | from the deep | ,

unless we take this as a case of double trochee, discussed below.

B. It is in reference to irregularities of accentuation that I am most disposed to question the view given in the *Lessons*. Children or uneducated persons naturally read any iambic line with a sort of sing-song, emphasizing the accent on the alternate syllables without regard to the ordinary or prose accent of the separate words. An educated person feels this to be injurious not only to the sense, but to the sound also; and in his reading of poetry he gives to each word its own pronunciation without losing the consciousness of the general iambic rhythm. It is this educated reading of poetry which supplies the basis and test for our technical systems of prosody. Prosody has in the first instance to describe in simple and precise terms the rhythm of any passage as given by a good reader; and next it has to ascertain the general and special laws of the metre as employed by the poet and interpreted by the reader.

It seems to me that there are two different principles on either of which the facts of any metre may be consistently explained. A distinction may be made between the metrical accent and the natural emphasis of a syllable; and it may be maintained that the metrical accent is always present, but that it varies in force as it coincides with the natural emphasis. This is what I should call the artificial system. On the other hand, no accent except that of natural emphasis may be recognised. This I should call the natural system. It should be remembered, however, that the exigency of rhythm may sometimes require stress to be laid on a syllable in verse which it would not have in prose. For this the poet is responsible. The natural system simply professes to reproduce or stereotype his reading.

The two systems may be exemplified in the following lines:—

- (a) Then tore | with bloo | dy ta | lon the | rent plain |
- (b) Rocks, caves, | lakes, fens, | bogs, dens, | and shades | of death |
- (c) 'Tis sure | the hard | est sci | ence to forget |
- (d) Comfort, | my liege; | why looks | your grace | so pale? |

It is plain that all these lines depart from the typical 5-foot iambic metre. The natural system would describe the irregularity of (a) as consisting in an unaccented eighth and accented ninth syllable; that of (b) as consisting in the accent on the first, third, and fifth syllables; that of (c) in an unaccented eighth syllable; that of (d) in an accented first and unaccented second syllable. The artificial system maintains that in (a) *the* is accented though unemphatic, and *rent* unaccented though emphatic; that in (b) *rocks*, *lakes*, and *bogs* are long in quantity, but unaccented; that in (c) *to* is accented; and in (d) the first syllable of *comfort* is emphatic but unaccented, and the second accented but unemphatic. In the *Lessons* the artificial system is that which is generally followed, but in lines of the type (d) it is abandoned for the natural system. The trochee is recognised as belonging to the iambic metre. But if this is so, why not recognise the spondee in lines of the type (b), and the pyrrhic in lines of the type (c)? The reason for calling *comfort* a trochee is that a good reader lays more stress on the first than on the second syllable. For the same reason the name of spondee must be conceded to the three feet, *rocks, caves; lakes, fens; bogs,*

*dēns*: no good reader would make any difference in the stress he laid on the first and second syllables in each. I do not imagine any one would be found to dispute this, but perhaps the line—

Kill, fire, | burn, slay, | let not | a trai | tor live |

is a still stronger case in point. Similarly the fourth foot of (a) and (c) ought to be called pyrrhics. A good reader would, if anything, lay less stress on *the* and *to* than on the preceding syllables.

Following, then, the natural system of accentuation, I should classify irregularities as arising from (a) excess, (b) defect, or (c) transposition of accent in the same foot.

(a) Excess of accent is shown in the substitution of the spondee for the iambus. That this deserves at least as much attention as the substitution of the trochee will appear from the examination of a few lines of Milton. Thus, in the first hundred lines of the *Paradise Lost*, I find forty-two spondees compared with twenty trochees; and this prevalence of the spondaic rhythm greatly contributes to the stately and solemn tone of Milton's poetry.

(b) Defect of accent appears in the substitution of the pyrrhic for the iambus. The effect of this is to throw additional weight on the next emphatic syllable.

(c) Transposition of accent appears in the substitution of the trochee for the iambus. In the *Lessons* two laws are laid down with regard to the use of the trochee in iambic metre: (1) that a trochee cannot follow upon a trochee, (2) that a pause or at all events a long syllable is necessary before a trochee. With regard to the former, it is stated that "it is usual to quote as an exception Milton's line,

Un | versāl | reproach | far worse | to bear | ,

but that such a line would be a monstrosity, and it is far more likely Milton pronounced *universāl*." If this were really the only line in Milton where the double trochee occurred, there might be some excuse for trying to explain it away, though it is hardly likely that the word *universal*, of which Todd quotes twenty other examples from Milton, all used with our present accent, could have been pronounced differently in this one case.\* But the fact is, this line is by no means an isolated case of the double trochee. Compare—

- P. L. vii. 518. *Present*, | *this* to | his son | aſſid | bly spake |
- P. L. vii. 533. *Over* | *fish* of | the sea | and fowl | of the air |
- P. L. iii. 750. *In* their | *triple* | degrees : | *régions* | to which |
- P. L. iii. 586. *Shoots* in | *vſai* | *ble* vir | *tue* even | to the deep |

[Unless this line is taken, as suggested above, with a monosyllabic foot.]

- P. L. xi. 377. *In* the | *visions* | of God. | It was a hill
- P. R. i. 175 *Bilt* to | *vanquish* | by wis | dom hel | lish wiles |
- P. R. ii. 243. *After* | *ſorty* | days' fa | ſting had | remained |

the last a much harsher line to my ear than that quoted "Universal reproach," &c.

Nor is Milton alone among poets in his occasional use of the double trochee. Mr. Abbott (*Shak. Gram.* p. 329) quotes a few examples from Shakespeare, which might be largely increased; and instances might be given from modern poets, as Tennyson, in the *Coming of Arthur*,

*Felt* the | *light* of | her eyes | into | his life | .

It seems therefore that there is no ground for the assertion that the iambic metre does not admit of the double trochee. At the worst it is allowable as an occasional discord to add richness to the general

\* Since writing the above, I have been reminded that the line—

S. A. 175. Universally crowned with highest praises—

cannot be read as a regular iambic line unless the second and fourth syllables of "universally" are accented. But I see no reason why we should try to read this as an iambic, more than other lines in the same chorus, e.g.—

- 115. This, | this is he, | soft | ly a while |
- 116. Let us not | break in | upon | him
- 121. And by | himself | given o | ver—

all of which seem to me to have an anapaestic rhythm. Or—

- 329. Forthwith | how thou ought'st | to receive | him
- 1707. A sec | ular bird | a | ges of lives |

both of which (like 175) end a chorus, and the latter is preceded by a regular 5-foot iambic—

1706. And though | her bo | dy dies, | her fame | survives | .

More than this; if we examine the strophe to which 175 belongs, I think we can have little doubt that Milton meant it to be anapaestic, like the 172nd line to which it corresponds:—

- For him | I rec | kon not | in high | estate | 5 iamb.
- Whom long | descent | of birth | 3 iamb.
- Or thē sphere | of fōr | tūne rāis | es : Cf. 116, 329.
- But thee | whose strength | while vir | tue was | her mate | 5 iamb.
- Might have | subdued | the earth | 3 iamb.
- Univer | ſally crōwned | with high | ēst prāi | ses.

harmony. Even taken by itself it is not necessarily unmusical, and it is certainly forcible and expressive. Leigh Hunt singles out for special admiration the rhythm of the following Alexandrine—

*As the | God of | my life. | Why hath | he me | abhorred ? |*

To proceed to the consideration of the second law: no doubt the trochee sounds better if it follows a pause; but this cannot be called a law, in the sense that it is strictly observed by the best poets. Thus Milton has—

*P. L. vi. 912. Yet fell, | remem | ber and | fear to | transgress |*  
*P. L. v. 160. Before | thy fel | lows am | blithous | to win |*  
*P. R. ii. 171. And made | him bow | to the | gods of | his wives |*  
*P. R. ii. 180. Cast wan | ton eyes | on the | daughters | of men |*  
*P. R. ii. 405. And with | these words | his temp | tation | pursued |*  
*P. R. ii. 428. Not dif | ficult | if thou | hearken | to me |.*

J. B. MAYOR.

### LITERARY NOTES.

The Mazzinian organ, *La Roma del Popolo*, for Feb. 22, contains a desponding review of M. Renan's *La Réforme intellectuelle et morale*, by Signor Mazzini. He disapproves of the political inaction of the intellectual aristocracy of France, represented by Ledru-Rollin, Louis Blanc, Edgar Quinet, &c., who might and should have directed the Parisian insurrection to a better end.

G. L. Kriegk communicates to the *Allgemeine Zeitung* (Feb. 29) what he calls "An Autobiography of Gervinus," a sketch written in 1829, which gives an interesting though brief account of the historian's early intellectual history. His father was in middling circumstances, and insisted for some time upon the boy's choosing some mercantile career, so as to retard the beginning of his university life. He expresses himself as grateful to the works of Hessemer and Jean Paul for rousing his dormant energies to life, even though they filled him for a time with wild poetical aspirations, and led him alternately to wish to become an actor, and to fancy himself in love with a girl he had never seen. At last, as he was trying to write a conscientious journal of his mental uncertainties, it suddenly dawned upon him that he had mistaken his vocation, that his mind was naturally critical, and that science would give him the satisfaction which he sought in vain in aesthetics with Hessemer, in morals with Jean Paul, and six weeks later, he writes again to the same friend (Kriegk) that he is at last "three-cornered," and therefore happy and glad.

K. Goedeke writes to the same paper (March 3) to protest, at least on his own behalf, against the often repeated complaint that North Germans neglect and misunderstand Grillparzer, and he communicates two letters he had received from the poet, who spoke of himself in 1869 as "his own critic, and seeing everything grey upon grey," but grateful to Goedeke for expressing about his works just the thoughts which had directed and inspired their composition.

Chaucer tells us himself that his *Treatise on the Astrolabe* was chiefly translated from Latin treatises on the subject. It has been discovered, by Mr. Bradshaw and Mr. Skeat, that the treatise which he has made most use of (as it accounts for nearly two-thirds of his work) is the Latin version entitled *Compositio et Operatio Astrolabii*, translated from the original of Messahala, or Macha-allah, an Arabian astronomer of the eighth century. MS. copies of this Latin text are probably numerous, as there are no less than five in Cambridge.

### Art and Archaeology.

#### A PHYSICAL EXPLANATION OF TURNER'S LATER STYLE.

A VERY remarkable lecture was delivered to a crowded audience at the Royal Institution, on Friday last, by Mr. Liebreich, ophthalmic surgeon and lecturer at St. Thomas's Hospital, "on the effects of certain faults of vision on painting, with special reference to Turner and Mulready." He explained the changes in Turner's later pictures as arising out of an alteration of

Turner's sight, produced by dimness in the crystalline lens. This dimness developed itself during the last twenty years of Turner's life, and caused, in the first instance, a diffusion of light, which gives to his pictures painted after 1831 a peculiar blueish haze in the lighted parts of the canvas, contrasting too strongly with the surrounding portions in shadow. After the year 1833, a limited opacity develops itself in the crystalline lens, the effect of which is to give a vertical direction to that diffusion of light. The consequence of this further and more serious modification is a vertical streakiness in the pictures. Every illuminated point in nature was transformed on the picture into a vertical line, which is the longer in proportion to the intensity of the light of the point in nature. Thus, e.g. there proceeds from the sun in the centre of a picture a vertical yellow streak, dividing it into two entirely distinct halves, which are not connected by any horizontal line. But even less illuminated objects, like houses or figures, form considerably elongated streaks of light. In this manner, therefore, houses that stand near the water or people in a boat, blend so entirely with their own reflections in the water that the horizontal line of demarcation between house and water, or boat and water, entirely disappears, and all becomes a conglomeration of vertical lines. The lecturer maintained that everything abnormal in the shape of objects in the drawing, and even in the colouring of the pictures of that period, may be explained by this vertical diffusion of light. It was only during the last years of Turner's life that the dimness of his crystalline lens had increased to such an extent that it prevented him from seeing even his own pictures correctly. This alone is sufficient to account for the strangeness of their appearance, quite apart from any consideration of the state of his mind. In proof of this view, a very remarkable experiment was here introduced by the lecturer. A small copy on glass had been prepared of Turner's picture of Venice (1833), painted from sketches taken in Venice in 1829, before the painter's eyesight had begun to alter. This copy was then placed in a magic-lantern, and thrown upon a screen. By the addition then to the lantern of an optical contrivance simulating the subsequent defect in Turner's eye, the whole picture was transformed into the Venice which Turner saw on his second visit in 1839; the resemblance to his pictures painted after this date was certainly very striking. By the same contrivance an ordinary tree was transformed into a Turneresque tree, &c.

The lecturer then explained the influence of other more frequently occurring anomalies of sight on painting, especially of myopia, hypermetropia, and astigmatism, as well as that of colour-blindness, and proceeded in the second place to discuss a change perceptible in Mulready's later paintings. In the latter part of his life Mulready's crystalline lens became yellow, and therefore absorbed a certain small quantity of blue light. To understand the effect of this yellow discoloration, the best means is to look for a long time through a yellow glass. In the first moment we see all yellow; but soon the retina is dulled by the yellow light, and therefore the aspect of nature becomes again correct; not so the aspect of a picture: in a picture the intensity of light is so infinitely smaller that the quantity of blue light, completely absorbed by the yellow glass, cannot fail to be remarked even in such places of the picture as are painted with the intensest blue; while smaller quantities of blue pigment are not seen at all because they have been completely absorbed by the yellow glass. In this way we comprehend how it was possible that Mulready, in his later years, saw nature quite correctly, but his picture too yellow, and that he therefore painted it too blue, not, as is generally believed, too purple. If we look through the yellow glass at his later pictures, we see that all their faults disappear; the blue shadow of the flesh becomes grey, the purple face becomes naturally red, the glaring blue of draperies is softened. That we really, by means of this yellow glass, see his later pictures as Mulready saw them himself, is proved by applying it to the latter of two pictures, both in South Kensington Museum, representing the same subject ("Brother and Sister," or "Pinching the Ear"), the one painted in 1836, the other twenty-one years later.

After having explained that Turner, in consequence of what was really the beginning of cataract, saw nature changed, his picture, however, correct; that Mulready, through his yellowish lens, saw nature correct, but the colour of his picture changed; that another painter alluded to in the course of the lecture, in conse-

quence of his astigmatic eye, saw distant objects elongated in a vertical direction, while the painting on his canvas, on the contrary, was enlarged in a horizontal direction;—Mr. Liebreich explained the means by which such defects might be corrected, and concluded by saying that artists and art-critics ought to make the results of scientific investigations their own. In this way art-critics will often obtain explanations of certain changes in the style of painters, and artists avoid the inward struggles and disappointments which often arise through the difference of their own perceptions and that of the majority of the public.

The lecture will appear *in extenso* in the April number of *Macmillan's Magazine*.

#### CORNEILLE-PIERRE BOCK.

A MEMOIR of Corneille-Pierre Bock, by M. Alfred de Reumont, has just been reprinted from the *Annuaire de l'Académie royale de Belgique*, of which society Dr. Bock was an associate. Dr. Bock was born at Aix-la-Chapelle in 1804. After having prosecuted his academical studies at Bonn, at Heidelberg, and at Freiburg im Breisgau, he spent some time in Italy following up researches in classical and Christian archaeology. His first public post was that of professor extraordinary in the university of Marburg, to which he was named in 1821. But in 1834 the university was so disturbed by the serious antagonism between the elector and his subjects that Dr. Bock, then professor ordinary, felt his position no longer tenable, and resigned his chair. He next settled in Brussels, which he quitted after the death of his wife for Stuttgart, and finally fixed himself at Freiburg in the Breisgau. He was then named honorary professor in the philosophical faculty, and the lectures which he delivered in this capacity were always fully attended. They dealt chiefly with the history of art, but embraced that of literature and politics. The subjects of some of his most important courses were the history of the last days of the Eastern empire; that of the Iconoclastic emperors; and the origin of Christian art in its relation to classic work. It is to be regretted that, though he devoted all his life to special study, Dr. Bock has not published nor finished a single work of any length, so that his reputation even with the learned public is by no means that to which his considerable acquirements should have entitled him. In respect to the topography and archaeology of early Christian Rome, Constantinople, and Alexandria, he had amassed, in long years of labour, a fund of erudition which is now, it is feared, lost to the world. Though he has left numerous MSS. they are in a most unsatisfactory state, overloaded with corrections, and written in a hand which it is extremely difficult to decipher. His contributions to periodical literature and to the publications of societies were throughout his life incessant. All dealt with points connected with the history and archaeology of art. M. de Reumont closes his memoir with a brief account of some of the most important. They appeared for the most part in the *Bulletins de l'Académie royale de Belgique*, the *Jahrbücher des Vereins von Alterthumsfreunden im Rheinlande*, the *Christliche Kunstblätter*, and the *Niederrheinisches Jahrbuch für Geschichte und Kunst*. Dr. Bock was but sixty-six years old when he died on the 18th October, 1870.

#### ART NOTES.

C. J. Cavallucci gives a curious account (in the *Gazzetta ufficiale*) of the discussions which have been held respecting the site of Michelangelo's "David." In January 1503 (O. S.), when the statue was just completed, a council of artists and citizens met to discuss the question; Giuliano da Sangallo opined that the marble would perish by exposure to the weather, and that the "David" should therefore be placed in the middle arch of the Loggia dei Signori; Lionardo da Vinci, Piero di Cosimo, and others voted on the same side; Salvstro, a jeweller, and Filippino Lippi thought that the artist should be consulted and his opinion followed; Botticelli thought either in the Loggia or by the side of S. Maria del Fiore would be best; we are not told how Ghirlandajo, Perugino, and Lorenzo di Credi voted. The fears of Giuliano da Sangallo have now, after more than three centuries, been proved to be well founded, and experts express great anxiety as to the safety of the statue if it is left longer exposed to the action of frost and rain, an almost

imperceptible crack in the left leg of the figure being especially dangerous. The statue is now enclosed by substantial scaffolding, and its removal is settled upon, though its future place is uncertain; probably the Accademia delle belle Arti will be enriched with it.

The Lille Museum has again enriched itself by the acquisition of two considerable paintings. One is a remarkable specimen of the work of Simon van der Does; the other, a very valuable example of Pierre Verelst, a native of Antwerp, who was dean of the painters' guild at the Hague in 1660, and was one of the most distinguished disciples of Adrian van Ostade.

The illustrated catalogues for the sales of MM. Michel de Tretaigne, Pereire, and Paturle, may be obtained on application to M. François Petit, 7, Rue Saint-Georges, Paris.

At the sale of Étienne Arago, the Louvre Museum acquired the "Environs of Vincennes," by Étienne Moreau, for 2050 fr.; and the "Terrace at Versailles," a very beautiful example of Bonnington, for 3050 fr.

On the occasion of the excavations made lately at Pompeii, by the direction of Signor Fiorelli, in the presence of the Grand-duchess Olga, a table in Greek marble was discovered, decorated by painted figures, which are supposed to represent a scene from the Niobe. There were also found several bronze vases, and a rudder of bronze, supposed to have belonged to a statue of Fortune.

A worthy monument to the memory and honour of Ingres has just been erected in the great hall on the ground floor of the École des Beaux-Arts at Paris. A stele in white marble, designed by Duban, has received the bronze bust executed by M. Guillaume. On the base of the stele two medallions are sculptured, those of Ingres' two pupils, Hippolyte Flandrin and Simart.

A third and revised edition of the catalogue of the picture gallery at Oldenburg has just appeared. In the preface, the director, Herr von Alten, gives full particulars as to the general formation of the collection by successive grand-dukes. But the important feature of the work is the reproduction in an appendix of the different monograms and signatures which occur on the various paintings. It is hardly possible to over-estimate the value to students of catalogues executed in this thorough way, catalogues which really give us reliable materials.

The *Kieler Zeitung* for December 1871 contains an article by Professor Klaus Groth, which is nominally a review of Dr. Hermann Grimm's recent publication *Zehn ausgewählte Essays etc.*, but actually a very interesting commentary upon the notice of Asmus Jacob Carstens, which formed one of these ten essays. The account which it contains of the bygone interest and taste in art of the Schleswig-Holsteiners, an interest and taste which found perhaps its highest expression in the marvellous wood-carvings of Bruggemann, will be information to most, and has especial value as aid to us in tracing the line of Carstens' artistic descent.

A terracotta vase has been recently brought to light from the bottom of the Seine. It contained several small coins of Philippe le Bel, and a fine medal in gold which represents Philippe le Bel holding a sceptre in his right hand, and a *fleur-de-lis* in his left. The reverse is a cross which divides the inscription, and is surrounded by four *fleurs-de-lis*.

M. Beulé opened his course of archaeology at the Bibliothèque Nationale on the 20th of February. The subject was "Une maison pompéienne."

M. René Ménard concludes his excellent notice of the Pereire collection in the *Chronique des Arts* for February 18th.

J. E. Millais, R.A., has recently executed a portrait of Sir James Paget, which is one of the most masterly pieces of

painting which have ever come from the hand even of this most masterly painter. Sir James is represented at half-length; he is lecturing; on the slate behind him he has just chalked the fracture which is his text. Mr. Millais attended the class on one occasion to see Sir James in the act, and whatever Mr. Millais has seen he has a supreme power of painting. A full-length portrait of the Marquis of Westminster is also, in spite of pink, and in spite of the figure looking somewhat unsubstantial, a highly satisfactory achievement. It seems exacting, rather than just, to demand yet more of one who gives us so much. But, in face of this magnificent sleight of hand, rises up the recollection of the exquisite workmanship of some of Mr. Millais' earlier work, the lingering traces of which seem now to be fast disappearing, and we ask that Mr. Millais should give us yet again, as perhaps he alone can, the touch of colour carrying on its edge that drawing without which the freest handling degenerates into mere smudges of the brush.

Mr. Huth has just purchased two paintings by Mr. Watts, R.A.: the "Daphne," which was exhibited at the Royal Academy in 1870; and "The Three Graces," a picture which is a very charming and refined example of this artist's treatment of female form.

We have received with much regret the announcement of the recent death of M. Riocreux, the custodian of the Musée de la Manufacture de Sèvres. M. Riocreux had attained the ripe age of eighty-four. His name is well-known in this country as the author, in conjunction with M. Brongniart, of the valuable *Description méthodique du Musée céramique de la Manufacture de Sèvres*.

The engravings which were stolen from the library of the Louvre, a few days before the final struggle of the Commune, have turned up in a shop in the Rue Lafitte. The police got scent of the person by whom they were sold, and have seized a professional thief, who at once made full confession.

The projected restorations of St. Mark's at Venice are exciting dread and anger throughout the whole world of archaeology and art. The municipal council having destroyed—i.e. restored—Torcello, and inflicted much irreparable damage on other precious monuments, intends finally to set to work on St. Mark's. Salvati is to cook up the mosaics, the gilding is to be entirely renewed, the floor to be levelled up, &c. But can nothing be done to avert this catastrophe? Ignorance, not intentional vandalism, is directing the efforts of the council, and if appeal were made from proper quarters, they might perhaps stay their hands, and eventually this restoring fever might pass over. We have seen it ravage England and France, and, in watching its course, we have felt that what was lost was as nothing provided only Italy might escape. And now, whilst we sit still, zealous renovators approach St. Mark's. Such matters as these are commonly most at heart with those who can bring least time or power to serve them. But surely some one, lacking neither power nor will, might be found—say, for instance, Lord Stanhope—who might initiate here an effective protest against the wholesale degradation of one of the chief monuments of Europe.

Professor Dr. Anton Springer has accepted the Professorship of "Kunst- und Kulturgeschichte" in the new University of Strasburg.

In a letter to the *Beiblatt zur Zeitschrift für bildende Kunst* for February 23, Dr. Max Allihn demonstrates the untenableness of the theory recently put forth by Herr Bergau as to the interpretation of the Dürer composition commonly known as the "Vier Hexen." Herr Bergau maintains that the bullet on the table is the apple of Discord; that the "O. G. H." which has been taken to stand at one time for "o geliebte Hexe," at another for "o Gott hilf," means really "Olympischer Götterhader"! that three of the witches are Juno, Minerva, and Venus, and that the fourth must be Paris, because she is remarkably small-hipped and small-breasted. As to this last peculiarity, Dr. Allihn very correctly remarks that small breasts and narrow hips were points in the most esteemed type of female

beauty in the sixteenth century, and he might have added that in all the best periods of art artists have invariably approached as nearly as possible to the male type whilst accentuating the distinctive peculiarities of female form.

An exhibition of the works of Henri Regnault is in course of preparation at the École des Beaux-Arts.

A pupil of Hippolyte Flandrin, M. Perrodin, has just completed, in the church of Notre Dame de Paris, an important series of paintings. In the chapel of the Virgin behind the choir he has executed six compositions, the subjects of which are taken from the life of the patroness of the church. In the south transept, above the altar, M. Perrodin has depicted the Annunciation and the Assumption; in the arcades are twelve sacred personages, connected either with her life or worship. The martyrdom of St. Stephen is painted in the north transept, and in the arcades twelve saints, who were of the clergy of Paris. The artist has also decorated the inside of the doors of the "armoire aux chasses" with eight subjects from the history of St. Louis.

The Académie des Beaux-Arts has decided, in accordance with other sections of the Institut, that each of its members shall contribute a month's salary towards the work of the liberation of the French territory. The French artists have been for some time past actively engaged in organizing committees amongst themselves to receive contributions in money, or in works of art. The Comité Directeur published its circular in the *Moniteur universel* of February 25, and fresh names and fresh particulars are given every week in the *Chronique des Arts*.

The principal event of the Paturle sale was the contest between the agents of the museums of New York and Neuchâtel for the "Pêcheurs de l'Adriatique." This picture was the last painted by the unfortunate Leopold Robert, a native of Neuchâtel. It was executed in Venice, and was despatched to France early in 1835, but arrived too late for the "Salon," and shortly after this, on the 20th March, he committed suicide. An exhibition of his works was organized during the same year at Neuchâtel by his brother, Aurélien Robert. His nephew, M. de Meuron, was the agent sent by his native town to secure for their museum the last work of their distinguished fellow-citizen. The biddings ran high, but it is supposed that, on learning the state of the case, the New York agent ceded the point, and the picture became the property of the canton for the sum of 83,000 fr. A fine example of Troyon, "Animaux fuyant l'orage," went for 63,000 fr. The well-known "Anes au repos," by Decamps, was knocked down to M. Yriarte, after a spirited contest with the New York agent, for 51,500 fr. Scheffer's "Marguerite à l'église" fetched 40,000 fr. There seems, however, to have been a general sense of disappointment when the numerous paintings preserved in this collection, and held to have been the masterpieces of this artist, faced the blaze of common day. The mode is past.

Dr. Franz Bock, of Aachen, has just brought out, in conjunction with Mr. Willemsen, an archaeological historical description of *Die mittelalterlichen Kunst- und Reliquienschatze zu Maastricht aufbewahrt in den ehemaligen Stiftskirchen des heil. Servatius*. The book is amply illustrated with woodcuts.

We learn from the report for 1871 of the committee of the Germanischen National-Museum at Nürnberg, that they received during the past year, amongst other gifts, the important portrait by Albrecht Dürer, of Hieronymus Holzschuber, which has been presented by the Holzschuber family, in whose hands it has remained up to the present day.

The Hodshon picture gallery at Amsterdam comes to the hammer about the middle of April. It consists of twenty-five fine examples of the Dutch and Flemish schools in the sixteenth and seventeenth centuries, amongst which occur the names of Jan Steen, Van Dyck, Dow, Hobbema, Polter, and Ruisdael. The catalogue is on the point of appearing.

The *Gazette des Beaux-Arts* for the present month contains an article entitled "A propos d'un portrait politique," which narrates, from authentic documents, "extraits des archives du Saint-Office, qui sont à la Bibliothèque," a curious episode from the combat in which the court of Rome engaged to prevent the success of the candidature of Henry IV. These documents relate the prosecutions instituted against certain persons who had engraved in Rome a portrait of the "pretended king of Navarre." The facts in themselves are not unworthy notice, but they derive especial interest from the fact that the chief offender was Philippe Thomassin, the most celebrated of the "graveurs troyens." The most zealous researches have hitherto failed to bring to light the date of his birth, which is now settled beyond dispute, for in his deposition, taken June 12, 1590, he says, he is the son of Jean Thomassin, native of Troyes in Champagne, and aged twenty-nine years.—The "Vue générale de l'art chinois" is concluded.—The publication of documents relating to the arts during the Commune is continued.—M. Henri Lavoix contributes an entertaining chapter on the "Portraits of Molière."—M. René Ménard begins a notice of the Institution of South Kensington, and M. Champfleury reviews the Bibliophile Society's edition of the *Éloge de la Folie*, which has just appeared, accompanied by a careful and spirited reproduction of Holbein's original designs.

The magnificent bust of Voltaire by Houdon, which was sold at the Broderip sale for 665 guineas, became the property of Mr. Alfred Morrison.

On comparing the recent translation of Dr. A. Woltmann's *Holbein and his Time* with the original, it will be found that the work has been in parts quite remodelled by the author, and that in some respects he has materially improved upon the form of the German book. Unfortunately the results of the last two years' discoveries, which have materially added to our knowledge of the Holbein family, have not been incorporated into the translation, and the suppression of the catalogue of works makes the English volume quite useless to students.

The scope and intention of Mr. Eastlake's *History of the Gothic Revival* is announced on the title-page, where he defines it as "an attempt to show how the Gothic style which lingered in England during the two last centuries has since been encouraged and developed." With this object in view, his work opens with a description of some of the more notable phases of the survival of Gothic design—firstly, in the common and vernacular specimens of architecture which, though later in date than the introduction of the renaissance spirit into England, exhibit unmistakable characteristics of an unbroken Gothic tradition; and secondly in the Gothic works of Sir Christopher Wren. The conspicuous announcement above quoted would naturally lead us to expect a more thorough and exhaustive treatment of the intermediate styles; and few subjects could be more interesting than a discussion by a thoroughly competent writer, educated by an intimate acquaintance with buildings rather than with documents, of the gradual encroachment of the later on the earlier style, and its own adaptations and developments, which terminated on the one hand in a predominance which was never absolute (the conquered style from time to time re-asserting itself by a recognisable reversion), and on the other, in the formation of a style which was to the greatest possible extent national and vernacular. Some portion of the discussion which we have suggested might perhaps reasonably be considered beyond the present writer's scope, but, from any point of view, this portion of his work is very inadequate. The history of the development of antiquarianism (which should have been more clearly defined as a mere development of a special phase of a study which existed previously) brings the writer to the well-known epoch of Horace Walpole, whose literary and artistic mediaevalism, together with the products of the fashion which he set, is discussed at greater length than the importance or interest of the topic appears to deserve, seeing that no attempt is made to give any intellectual significance to this strange development. A similar defect is evident in the treatment of the later revival in the time, and in connection with the influence, of Sir Walter Scott. At this period, at least, the revival of Gothic architecture was distinctly the result of intellectual

changes of the widest extent and of the deepest possible import. From this to our own period, the history of Gothic architecture is one of unbroken and almost unchecked development, and in this more modern portion of his subject, Mr. Eastlake appears to be more at home—so much so that for mere facts he leaves little to be desired. For criticism it is otherwise. The criticism of contemporaries involves considerable embarrassment; and the means which Mr. Eastlake has adopted of solving the difficulty—that, namely, of modifying a lengthened panegyric of pretty even complexion by an occasional common-place exception—though no doubt safe, is scarcely profitable. His collocation of descriptions and illustrations will, however, give those who possess the necessary interest and capacity the means of forming theories of their own as to the tendencies of our own architectural period. While feeling grateful for this attempt to fill a gap in our art literature, we do not consider the present work to have attained a sufficiently high standard, either literary or critical, to merit more prolonged discussion. It is, in fact, little more than a compilation from somewhat obvious literary sources; whereas a really valuable work on this and cognate subjects should, in the first place, be founded on an acquaintance with stone rather than paper, and, in the second place, should embrace a thorough acquaintance with the intellectual changes implied in changes of external fashion.

### Physical Science.

**Stricker's Handbook of Histology.** [*Handbuch der Lehre von den Geweben des Menschen und der Thiere, unter Mitwirkung herausgegeben von S. Stricker. 1870-1.*] Leipzig: Engelmann.

DURING the thirty and odd years which have passed since Schwann published his famous essay, the science of Histology has progressed with most remarkable rapidity. Perhaps it would be more accurate to say that our knowledge of histological facts, our acquaintance with the details of the microscopical and so-called ultimate structure of living beings has become immensely extended. The admirable recent improvements in the microscope, the skilful or fortunate use of staining and hardening reagents, the possibility of carrying on microscopical observations at all manners of times and in all kinds of places, the exquisite pleasure, the charm of a satisfied curiosity which comes from the study of the delicate and fantastic patterns of animal and vegetable tissues—these and other causes have led to the accumulation of memoir upon memoir and of fact upon fact. But while the knowledge of particulars has come, wisdom has lingered; the insight into general laws has moved but slowly, or even stood still, if not actually gone back. Of the rank and file of histologists we might almost say that the breadth of their views has been in direct ratio to the focal length of

their lenses, year by year diminishing in arithmetical progression. There have been many, perhaps too many, animated controversies, but these have been for the most part factitious and unreal, while the efforts after a larger grasp have been few and far between. When, therefore, it was announced some two years or more ago that "all the talents" of Germany were about to join under Stricker's leadership to write a new *Handbook of Histology*, the hope sprang up that a work might result which should mark the beginning of a new era in histology, and breathe a spirit of unity into a body of disconnected facts.

We cannot say that this hope has been fulfilled. With all respect to the many praiseworthy labours of the Viennese histologist, the production of himself and his fellow-workers, the last part of which has just reached us, shows that he does not possess the peculiar qualifications for so important a task as that of editing such a volume. It was within his choice either to select such writers as would, without further oversight on his part, do their respective works in such a way as to construct a congruent whole, or by constant editorial action to have fitted together the unequal segments. Neither of these has he done; indeed in an exceedingly *naïve* preface he simply flings over all such graver duties.

The various writers seem to have had no definite standard whatever set before them. Some of the contributions are just what all the articles in such a work ought to have been: exhaustive but concise and critical expositions of the present state of our knowledge concerning the subjects in hand, the author's individual views being not concealed but subordinated to the views generally held, or at least not made predominant. Such are the articles of Max Schultze on the Retina and on the Structural Elements of the Nervous System. These are very clearly written, are not too long, embody all the important points of the author's own researches, and yet distinguish very successfully between the actual known and the hypothetical or probable, and may be studied with profit both by the young student who knows little or nothing of the subject, and by the working histologist who is already acquainted with Max Schultze's original memoirs. Very similar in general scope and work is Waldeyer's article on the Auditory Nerve and Cochlea, thus contrasting favourably with the preceding one by Rüdinger on the Membranous Labyrinth, which is singularly lacking in expository power. Somewhat differing from these longer articles, in as much as they deal with quite special points, but still characterized by the same good qualities, are the articles by Brücke on Muscle in Polarized Light, and by Kühne on Nerve and Muscle Fibre. The title of the latter should however rather have been "On the Ending of Nerves in Muscles;" and we see here in a very marked manner the editorial deficiencies. Kühne's paper deals only with the terminations of the nerves in muscles, and deals with the subject, as on such a matter of detail might be expected, from his own point of view; Brücke's article treats of the appearances presented by muscle under polarized light. Both papers would have been extremely valuable as adjuncts to a general exposition of the structure of striated muscle; but this, perhaps the most important subject in the whole range of Histology is, marvellous to say, absent.

More than half the fourth part is taken up with an article by Meynest on the Mammalian Brain. This is in great measure a monograph embodying the author's own views on the subject, and as one of a series of similar monographs would have been a valuable memoir in its right place. But to speak of it as an expository treatise would be a jest. Writing in exceedingly bad German, and in as twisted and matted a style as it was ever our misfortune

to meet with, the author complicates the difficulty of an already sufficiently complex subject with further and needless perplexities of his own making.

Several, we might say very many, of the articles have a fault of quite a different kind; the writer's individuality, instead of being in excess, is not sufficiently prominent—the result being a certain flabbiness and want of tone. Such for instance is the contribution of Rollett on the Blood. Perhaps no one subject in the whole work afforded larger scope for decisive handling; but Rollett's article is loaded with detail without being exhaustive, enters into a variety of theories without the safeguard of a searching criticism, is an industrious compilation of real or supposed facts without perspective, and what appreciation of size it shows, is in the direction of magnifying unduly the most recent novelties from the newest physiological laboratory.

A similar want of judgment concerning the relative importance of various topics must, too, we fear, be laid to the charge of the editor himself.

The article on the Cornea is of inordinate length, apparently for the reason that of late years corneal research has been the fashion among young histologists, so that histological journals are seldom continued for many numbers without a paper on the cornea. On the other hand the articles by Hering and Ludvig on the Liver and Kidneys respectively, which together occupy fewer pages than does the cornea alone, to a certain extent suffer because the writers have evidently been anxious to confine themselves within fixed limits. The article by Pflüger on the Salivary Glands is longer than either Hering's or Ludvig's; and while every one is very glad that Pflüger should have such an opportunity of expounding his own particular views, the length of space given to him is out of proportion to the relative importance of his topic, compared with that of the two articles just mentioned. Had it been worth while to undertake the labour of such a book with the knowledge that it could only last a few years, the plan of giving up space to what may be called in a certain sense topics of the day would have been intelligible enough. But the editor surely had the ambition that this book should last for many years at least; and in such a case to stint matters of lasting value for the sake of enlarging on questions whose interest is emphatically of to-day, and may prove quite transitory, shows want of judgment.

But it may be we wrong the editor in laying this charge at his door; his plan has been, perhaps, to have no plan at all, and hence each contributor has taken just such space as he pleased. The older tried writers have accordingly drawn away towards the golden line of silence, while the younger writers have written without restraint.

In some however of the articles contributed—or rather in reference to some of the topics treated of by the younger coadjutors—one would have gladly seen a greater amount of matter. We cannot but regard it as error to have left such an important matter, for instance, as that of the placenta to be written up, "unter Stricker's Leitung," by an investigator whose chief qualification seems to be that the organ in question has been selected by him as the field of his *Erstlingsarbeit*. The subject in consequence, by no means of least importance, has been very imperfectly treated, as will be recognised at once when it is stated that all the writer knew or thought worthy of mention about the placenta is comprised without compression in *three* pages of a work in which the cornea occupies more than fifty.

The articles which we have selected for special mention may be regarded as typical of so many classes in which all the contributions may be arranged according to their value and character; and it will be evident from what we have

said that the publication of this *Handbook of Histology* does in a certain sense mark an opportunity lost. The work is not, what we hoped it might have been, a general exposition exhaustive in character, and yet manifesting a bold grasp and clear critical insight; it is not a series of original monographs, a few of which might become classical and thus the whole remain valuable; it is not a text-book to put into the hands of a learner, being in this respect less useful than Kölliker's work and far below Sharpey's treatise; but it is a collection of essays very diverse in value and dissimilar in bent, and, except that it does nominally embrace the whole range of Histology, might almost have been published under the title of an *Archiv* without the editor's intention being recognised.

Regarded indeed as an *Archiv* it does fulfil very important functions, justifying perhaps the labour bestowed on the English translation which Mr. Power has undertaken for the New Sydenham Society. It gives a very vivid picture of the immense histological activity going on in Germany at the present moment; it brings before the reader all the latest information, shows him all the lines of enquiry which are being worked, makes him thoroughly acquainted with all the various controversies now raging, and if English work has perhaps been a little neglected by the various writers (if for instance the name of our most active successful microscopist, Dr. Beale, occupies greater space in the foot-notes than the facts which he has observed in the text), it is perhaps scarcely the part of an English reviewer to complain.

Of the intrinsic value of the various controversies which go so far to swell the volume, in what way they will probably end, which in each debated part is grain and which is chaff, it does not become a single critic to speak in a judicial spirit. It is his duty to report that the whole field is vexed with many eddies and crossing currents, and that it should have been the duty of the editor to show that there was also a general stream in a given direction, and to have made it clear what that direction was.

MICHAEL FOSTER.

### Scientific Notes.

#### Geography.

**The Region of Mount Vitos in Central Turkey.**—Dr. F. von Hochstetter, the geologist of the north island of New Zealand, publishes in *Petermann's Mittheilungen* the results of his geographical and geological researches made during 1869, in the district surrounding Mount Vitos. Though classic ground, and the source country of rivers described by Thucydides and Strabo, the region has remained up to the present time a blank in the exact topography of Europe. Dr. Hochstetter accompanied a large party of engineers and surveyors, whose object was the selection of a route for the central line of the future railway network of Turkey, and used this opportunity of collecting valuable material for the construction of the large scale map (of an area of about 4500 square miles of country) published with his memoir. A notable feature of the map is the great number of elevations above sea-level, determined by levelling and barometer, which are marked on it. The Vitos, a huge mass of syenite, rising to a height of 7600 feet, stands midway between the Rilo Dag and the Balkan, and may be considered the central point of Turkey, being the source mountain of four of its chief rivers. It bears the same relation to Sofia, the capital of southern Bulgaria, as Vesuvius does to Naples, or Table Mountain to Cape Town, and is weather prophet for the whole region; when the mists collect into clouds round its summit-plateau in summer, refreshing showers water the plain of Sofia; when a white snow-cap appears in winter, heavy storms are expected in the lowland. The magnificent view commanded by the summit, and the ease with which the mountain is ascended, will doubtless make Mount Vitos the Rigi of Turkey as soon as the district is opened up by railways. The famed iron-country round Samakov, south of the Vitos, will also become accessible, and this has been considered a point of great national importance by the Turkish government: from the peculiar character of the distribution of the mineral, however, Dr. Hochstetter does not anticipate any great future development of this industry. The iron ore occurs as grains of magnetite in

the syenite which extends over a vast area, and is collected at weirs intercepting the mountain torrents which wash it from its matrix.

**Arctic Regions.**—Dr. Petermann has collected and published in the *Mittheilungen* the results of those expeditions of last year which took the direction of Spitzbergen, extracted from journals kept in no less than thirteen vessels, and gives in a memoir the history of the discovery of Gillis and King Carl Lands to the north-east of Spitzbergen; each subject is illustrated with most admirable charts. The map of the sea-bed round Spitzbergen is specially interesting, showing clearly the limits and the steep outward slopes of the great submarine plateau on which the archipelago rests. A great point in the work of last year was the discovery and survey, by Mr. Leigh Smyth and his Norwegian sailing-master, Captain Ulve, of a hitherto unsuspected extension of the north-east land of Spitzbergen, proving it to stretch three degrees farther eastward than the supposed coast, and nearly doubling the extent of land hitherto shown upon the map. The additions made to our knowledge of the temperatures of the sea in these regions, both at its surface and at various depths, are likewise of great importance. Generally, Mr. Leigh Smyth found the water colder below than on the surface; but there were some exceptions, these being the most remarkable:—

July 1st, Lat. 70° 40' N. Long. 20° E.	
	Maximum. ° F.
Surface . . . . .	38 . . . . .
100 fathoms . . . . .	38 . . . . .
Bottom 200 fathoms . . . . .	44 . . . . .
	Minimum. °
Surface . . . . .	38 . . . . .
100 fathoms . . . . .	35 . . . . .
Bottom 200 fathoms . . . . .	35 . . . . .

September 11th, Lat. 81° 15' N. Long. 18° E.	
	Maximum. °
Surface . . . . .	33 . . . . .
No bottom 300 fathoms . . . . .	42 . . . . .
	Minimum. °
Surface . . . . .	33 . . . . .
No bottom 300 fathoms . . . . .	33 . . . . .

**South Africa.**—Herr Carl Mauch, the explorer of the South African gold-fields, has sent to Gotha a most valuable geological map of the Transvaal Republic, based upon his own journeys and astronomically determined positions. The traveller, at the date of his communication in July 1871, was on the point of undertaking a new journey to Manica between the Limpopo and Zambezi rivers. South African newspapers announce the discovery of diamonds in various parts of the north and north-west of the Transvaal Republic. This greatly extends the known field of their distribution, and gives a prospect of a much wider region of active search.

#### Zoology.

**Hippocampus and Calamostomus.**—All the species of recent Hippocampi lack a caudal fin; their slow movements are entirely effected by the rapidly undulating dorsal fin, the tail having merely a prehensile function. In this respect they differ from the otherwise extremely similar fossil Calamostomus from Monte Bolca. Professor Canestrini, of the University of Padua (who has recently been elected one of the foreign members of the Zoological Society of London), has made the interesting discovery that very young Hippocampi are provided with a rudimentary caudal fin, and he regards this as direct evidence of a genealogical connection between these two genera. A similar relation exists between the recent genera Nerophis and Syngnathus, the latter being provided with, while the former is without, a caudal fin. (*Atti Istit. venet. di Scienze*, vol. xvi.)

**Development of Sturgeons.**—Not less interesting than the discovery of a caudal fin in the young of Hippocampus is that of the presence of teeth in recently hatched sturgeons. This discovery was made by two observers, Pelz and Knoch, nearly at the same time, and independently of each other. The latter describes and figures them in *Bull. Soc. Nat. Mosc.* 1871; in the sterlet (*Acipenser sterletus*) there are ten teeth in the upper jaw and eight in the lower. These teeth are not without function, the young sterlets being carnivorous, and, in fact, so voracious that they attack each other. The exact period when these teeth are lost has not yet been ascertained.

**The Hairy Tapir (*Tapirus Roulini*)** has hitherto been one of the greatest desiderata for zoological collections; beyond two skulls presented by Roulin, the discoverer and first describer of this animal, to the Paris Museum in 1829, no other example has ever been brought to Europe. This is to be accounted for less by its scarcity than by the difficulty of transporting skins of so bulky an animal on the back of Indians from the highlands of Ecuador and New Granada, to which region it is confined, to the coast. Thanks to the exertions of Mr. Buckley, the British Museum has recently acquired a very fine series of six perfect examples, three adult, two halfgrown, and one young, the skeletons and skulls having been preserved beside the skins. This tapir differs from the lowland species in being covered with dense and long black hair, which adapts it to the requirements of the colder elevated region that it inhabits. The young, as in all the other American tapirs, is spotted or banded with white or yellow, thus calling to mind the affinity of these animals to the pig.

**The Fauna of the Mammoth Cave.**—In the *American Naturalist* for December 1871 and January 1872, the editors have collected a vast amount of interesting matter regarding the Mammoth Cave and its inhabitants. The remarkable blind fishes are described by F. W. Putnam; the paper being provided with some excellent steel-plates illustrating the anatomy of *Amblyopsis spelæus*, as well as that of *Chologaster cornutus*, *Typhlichthys subterraneus*, and *Chologaster Agassizii*. Diptera are represented by two species, one of *Anthomyia*, the second belonging to the genus *Phora*. Among the beetles are *Anophthalmus Telkamiffii*, which is totally blind, and *Adelops hirtus*, on which are seen two pale spots that may be rudimentary eyes. Next there are two wingless grasshoppers, *Hadenocerus cavernarum* and *Raphidophora stygia*, with perfectly formed eyes. A species of *Campodea* (*C. Cookei*) is remarkable for occurring in the vicinity of the cave: it is without eyes. Of the Myriopods, *Spirostrephon Copei* was met with three or four miles from the mouth of the cave; it is the only truly hairy species known, and is blind; the other species of this group found living in caves have eyes. Next to the blind fish, the blind crawfish (*Cambarus pellucidus*) has attracted most attention. The eyes are atrophied; the cornea exists, but is small, circular, and not faceted. The eyes are more perfect in the young than the adult, indicating ancestors unlike the species now existing. There is further an isopod crustacean (*Cacidotia stygia*) found, in company with the *Campodea*, on the sandy bottom of a shallow pool four or five miles from the mouth of the cave. It is nearly allied to *Idotea*, but differs from it in being blind; as its nearest allies are marine, it is difficult to explain how the present form became a cave-dweller. The authors have figured a fish with eyes which was found in the stomach of an *Amblyopsis*. Guided probably by the movements which its prey makes in the water, so sensibly influencing the delicate tactile organs of the blind fish, the latter is enabled to follow rapidly, while the pursued, not having the sense of touch so fully developed, is constantly encountering obstacles in the darkness.

**Domestic Dogs in Brazil.**—Dr. R. Hensel relates (in the *Zoolog. Gart.* Frankfurt, 1872) his experiences of the domestic dog of Brazil. No well-marked race can be distinguished, with the exception of one used in chasing deer; and European races, introduced into the country, soon degenerate. He instances the pointer, the form of the head of which becomes entirely changed; with every successive generation the skull becomes shorter, finally resembling that of a bull-dog, whilst the ears retain their usual length. Individuals with a very short head had the forelegs curved, so that this change appears to be due to rachitis.

**The Aquarium at Berlin.**—We find from the annual report of the secretary of this establishment that the income derived from visitors during the year 1871 amounts to 52,955 thalers (7943*l.*), the number of visitors admitted on payment having been 215,828. This is rather more than half the number of visitors who paid for admission to the Zoological Gardens in Regent's Park last year. The price of admission is nearly the same in both cases, but, like all other similar institutions on the continent, the Berlin Aquarium is not only open to the paying part of the public on Sundays, but the price of admission is reduced to one-half during the afternoon of that day.

A new zoological journal has been started in France by Professor H. de Lacaze-Duthiers under the title *Archives de Zoologie expérimentale et générale*. The annual volume will be issued in three parts in octavo (at a price of 32 fr.); the first part contains 144 and xvi pages, and five steel-plates. In a long introductory article on the "Direction des études zoologiques," the editor explains that the journal is intended to take a position in French literature similar to that occupied by Siebold and Kolliker's *Zeitschrift für wissenschaftliche Zoologie*. The first part contains two original memoirs: 1. "Histoire naturelle du *Dero obtusa*," by Dr. Ed. Perrier (pp. 65-96); and 2. "Otocystes ou capsules auditives des Mollusques gastéropodes," by the editor (pp. 97-144). The remaining sheet is devoted to shorter notices and reviews.

*Die in Deutschland lebenden Arten der Saurier, untersucht und beschrieben von Dr. Franz Leydig*, Tübingen, with 12 plates.—The author intends to give in this work a complete description of the external characters, internal structure, and natural history of the Lizards of Germany. The work is accordingly divided into three parts: 1. A detailed account of the anatomy of the genera *Lacerta* and *Anguis*, with particular reference to the species found in Germany. This is by far the most important part of the work, and may be consulted with advantage by all students engaged in the anatomy of Saurians; those only will be disappointed who seek for myological details. 2. A general account of the biological phenomena. 3. Special descriptions of *Lacerta viridis*, *agilis*, *vivipara*, and *muralis*, and of *Anguis fragilis*. The plates illustrate the first part, and are beautifully executed.

*Öfversigt af K. Vetenskaps Akademiens Förhandlingar*, vol. xxvii.—We have received Nos. 8-10, which contain the first part of an account of the Scandinavian Myriopods, by A. Stuxberg; a paper on opercular structures in corals, by G. Lindström; and a highly important contribution to the history of the Oligochaetous Annelids of Scandinavia, with a monograph of the eight species of *Lumbricus* met with in that part of Europe, by G. Eisen.

*Bulletin de la Société impériale des Naturalistes de Moscou.*—The volume for 1871 contains Dr. J. Knoch's account of his journey to the Volga, undertaken for the purpose of obtaining ova of the sterlet (*Acipenser sterletus*). The greater number of the other zoological papers are devoted to descriptive entomology: Baron de Chaudoir has continued his monograph of *Lebiidae*; M. Ballion makes additions to Gemmings and Harold's invaluable *Catalogus Coleopterorum*, adds a hundred new beetles to the Russian Fauna, and describes *Leptura Jaegeri* and *Stenura oxyptera*; Messrs. Lindemann, Hochhuth, Erschoff, and Becker have papers on various local Faunae of the Russian Empire; M. Lindemann compares the skeleton of Hymenopterous Insects with that of Coleoptera; and M. Erschoff has critically examined the species of Lepidoptera established by Eversmann.

In the two annual parts (Nos. 11 and 12) of the *Journal de Sciences mathématiques, physiques et naturelles da Academia R. das Sc. de Lisboa* for 1871, Professor B. du Bocage has continued his account of the ornithology of the Portuguese possessions in West Africa, with the description of a new pelican, and notes on *Francolinus rubricollis*; M. de Brito Capello issues the first part of his list of the Fishes from Madeira, the Azores, and West Africa in the Lisbon Museum, and contributes descriptions of new Crustaceans; M. Luso da Silva's Catalogue of the Land and Freshwater Shells of Portugal supplies a great desideratum in conchylology; it is not completed in the two parts of last year.

The publication of the fifteenth volume of the *Mémoires de la Société des Sciences naturelles de Cherbourg* has been considerably delayed. Observations on zoology are confined to two papers, both by M. Henri Jouan, entitled "Notes sur les Archipels des Comores et des Seychelles" (pp. 45-123), and "Notes de Voyage sur Aden, Pointe-de-Gallès, Singapore, Tché-fou" (pp. 169-198). A paper on Lophobranchs by Dumeril is an abstract from his general Ichthyology.

Baumhauer's *Archives néerlandaises des Sciences exactes et naturelles* for 1871 contain an important paper by W. Marshall on the elongated caudal plumes of the birds of paradise (livr. iii. 296). He was aided in his observations by the extremely rich collection of the Leyden Museum, which, we may state in illustration of its completeness, comprises a series of fifty-three specimens of *Paradisea apoda* and seventy-two of *Paradisea regia*, not one of which can be considered a duplicate.—Dr. Bleeker has contributed descriptions of a new *Cirrhitilabrus* and *Chilinus* (livr. iv. 326).

A letter from Mr. A. S. Packard, Jun., of Salem, Mass., one of the editors of the *American Naturalist*, directs attention to the report of Dr. Dohrn's investigations on the embryology of the Arthropoda in the *Academy* for 15th January (vol. iii. p. 28). Mr. Packard states that he does not group the Trilobites with the Isopoda, considering them to have no characters in common; while so far from excluding Pterygotus and Limulus from the Trilobites, he attempted to show (*Amer. Nat.* iv. 498) that the Limuli are closely allied to the Trilobites. It would seem, in fact, that Dr. Dohrn's views have been anticipated about a year.

### Physics.

**A New Form of Galvanic Battery.**—By using a concentrated aqueous solution of potassium permanganate, acidulated with sulphuric acid, in the place of nitric acid, in a Grove's battery, J. H. Koosen (*Pogg. Ann.* 144, 627) has produced an element of greater power, its electromotive force, according to numerous determinations, being at least double that of a Daniell. While the electromotive force of a Grove's element varies according to the strength of the nitric acid, that of the permanganate couple, the author finds, remains the same no matter what the concentration of the liquid: the introduction of a single drop of permanganate solution into the porous cell containing acidulated water at once develops the full force of the current; this of course subsides as rapidly owing to the decomposition of the permanganate. It is well known that in Grove's battery, owing to the evolution of gas, there is a continuous movement of the liquid in the cell, constantly bringing fresh portions of acid to the surface of the platinum plate; when permanganate is used, the dissolved salt in immediate contact with the plate is soon exhausted, and owing to its small diffusive power a fresh supply is not immediately forthcoming, so that the strength of the current sinks rapidly; the slightest agitation, however, suffices to restore it to its original strength. This difficulty the author overcomes by increasing the surface of the platinum plate, constructing it as follows: a number of strips of the same size are cut from very thin sheet platinum, slightly narrower than the diameter of the porous cell, and about 4 cm. shorter than the cell in length; these are placed one above the other and soldered together at either end with gold, at the middle of their narrow ends; a platinum wire, at least 1 mm. thick, is also soldered to one plate as pole wire; the several halves are then so bent apart as to form a cylindrical fan of platinum plates. By dispensing with a porous cell the internal resistance may be greatly lessened; in which case, in order to prevent contact between the platinum and zinc, a cylinder of coarse hair-cloth is loosely placed inside the zinc

cylinder, on this rests the platinum electrode; the whole is charged with water and sulphuric acid, the permanganate (20 to 30 grm. in crystals) being placed in a platinum sieve with meshes not more than 1 mm. in diameter, resting on the zinc cylinder, but separated from it by the hair-cloth, which has therefore to be longer than the cylinder itself.

**Relations between the Optical Rotatory Power of Organic Bodies.**—F. W. Krecke, in a most exhaustive and interesting memoir (*Archives néerlandaises*, 6 (1871), and *Jour. f. prakt. Chem.* 5, 6), discusses the subject of circular polarisation and the undoubted relations which exist between the rotatory powers of bodies of the same class, such as the carbohydrates, the cinchona and opium alkaloids, &c. His investigations lead him to the conclusion that the molecular rotatory powers of various carbon compounds obey two laws:—(1) That if an optically active body enter into combination with an optically inactive body, or if it be modified by chemical agents, the molecular rotatory power either remains unaltered or becomes so modified that the molecular rotatory power of the new body is a simple multiple of that of the mother substance. (2) That the molecular rotatory powers of isomeric substances are multiples of one and the same number. Among many others the following examples are given in proof of the existence of these laws:—

GLUCOSSES. ( <i>m</i> ) = molecular rotatory power.	
	( <i>m</i> ) = °
Dextrose (fresh solution) . . . . .	+190°8 : 4 = 47°7
" (old solution) . . . . .	+ 96°3 : 2 = 48°1
Laevulose ( <i>t</i> = 15°) . . . . .	-190°8 : -4 = 47°7
" ( <i>t</i> = 90°) . . . . .	- 95°4 : -2 = 47°7
Galactose (fresh solution) . . . . .	+251°3 : 5 = 50°2
" (old solution) . . . . .	+149°8 : 3 = 49°9
Maltose . . . . .	+286°2 : 6 = 47°7

By dividing the sum of the molecular rotatory powers by the sum of the numbers in the third column, a mean value is obtained for the common factor :  $\frac{1260 \cdot 6}{26} = 48 \cdot 5$ , with the help of which the following results are obtained:—

	( <i>m</i> ) =	Theory.	Experiment.	Difference.
Dextrose (fresh solution) . . . . .	= 48°5 × 4 =	+194°0	+190°8	+3°2
" (old solution) . . . . .	= 48°5 × 2 =	+ 97°0	+ 95°3	+0°7
Laevulose ( <i>t</i> = 15°) . . . . .	= 48°5 × -4 =	-194°0	-190°8	-3°2
" ( <i>t</i> = 90°) . . . . .	= 48°5 × -2 =	- 97°0	- 95°4	-1°6
Galactose (fresh solution) . . . . .	= 48°5 × 5 =	+242°5	+251°3	-8°8
" (old solution) . . . . .	= 48°5 × 3 =	+145°5	+149°8	-4°3
Maltose . . . . .	= 48°5 × 6 =	+291°5	+286°2	+4°8

The greatest difference between the calculated and experimental numbers is 8°8, or slightly above 3% a difference which certainly is not greater than the possible error of experiment.

SACCHAROIDS. ( <i>m</i> ) = °	
Lactose (fresh solution) . . . . .	+323°5 : 13 = 24°9
" (old solution) . . . . .	+202°8 : 8 = 25°3
Saccharose . . . . .	+252°4 : 10 = 25°2
Melzitose . . . . .	+321°8 : 13 = 24°7
Melitose . . . . .	+348°8 : 14 = 24°9
Parasaccharose . . . . .	+369°4 : 15 = 24°6
Mycose (Trehalose) . . . . .	+752°4 : 30 = 25°0

The mean value of the common factor of this group is 24°96°, which is about half that of the factor of the glucose group (48°5°). The following explanation is given by the author of this law of simple relations. In racemic acid we have an optically inactive body, consisting of an equal number of molecules of dextro- and laevo-rotatory tartaric acid, but bodies containing an unequal number of molecules of either modification may be imagined: thus in a compound of 5 mols. dextro- and 1 mol. laevo-rotatory tartaric acid, the action of a molecule of the dextro-rotatory acid would be neutralised by that of the laevo-rotatory, and such a mixture would consequently have  $\frac{1}{3}$  of the rotatory power of dextro-tartaric acid. A compound of 4 mols. dextro- and 2 mols. laevo-rotatory acid would only exert  $\frac{1}{2}$  of the rotatory power of dextro-rotatory acid. To apply this theory to other substances, it is merely necessary to select from each group of bodies possessing a common factor that one which rotates most to the right, and to oppose to it that which rotates equally in the opposite direction, then all the remaining members of the group we may consider to be formed by the union of varying numbers of molecules of these two. If, in the case of the glucoses, the molecular rotatory powers of which are to each other as 4 : 2 : -4 : -2 : 5 : 3 : 6, we assume that besides the dextro-rotatory maltose there exists one of exactly equal laevo-rotatory power, and if for convenience it be supposed that all these bodies consist of twelve molecules, they may be considered as composed as follows:—

Dextrose (fresh solution) . . . . .	10 mol. + maltose and 2 mol. - maltose
" (old solution) . . . . .	8 " + " " 4 " - "
Laevulose ( <i>t</i> = 15°) . . . . .	2 " + " " 10 " - "
" ( <i>t</i> = 90°) . . . . .	4 " + " " 8 " - "
Galactose (fresh solution) . . . . .	11 " + " " 1 " - "
" (old solution) . . . . .	9 " + " " 3 " - "
Maltose . . . . .	12 " + " " 0 " - "

In his *Index of Spectra*, Dr. Watts has collected from every source measurements of the spectra of the elementary bodies, and reduced them to a uniform scale of wave-lengths. Great confusion has arisen from the use of different scales in the mapping of strata, as well as from the varied dispersive powers of the materials forming the prisms, and from other causes. In dispersion spectra the relative breadth of the colours differs according to the nature of the prism, and it is evident that the exact position of a line can only be indicated by its colour; in other words, by the length of the wave of light producing it. In a diffraction spectrum the position of a line depends solely on its colour, and never shifts, no matter by what method the spectrum be formed. For the positions of lines to be comparable, the spectra must either be diffraction spectra or the observations made with prisms must be reduced to wave-lengths either by graphical interpolation or by aid of the formula used by Gibbs. Dr. Watts has based his calculations on Ångström's measurements of the wave-lengths of the principal Fraunhofer's lines, and under the name of each element (and air) he has tabulated the results of the examination of each line in vertical columns, the first of which gives its number when met with in Bunsen's first drawings; others the wave-lengths calculated from the observations of Ångström, Huggins, Kirchhoff, Plücker and Hittorf, Thalén, and others; and the last the intensity of the line roughly estimated. At the end of the index are drawings of the spectra of each element made on Bunsen's plan and arranged alphabetically: they represent the dispersion spectra, and are those referred to in the first column of the tables. The intensity of a bright line is in each case indicated by the altitude of the line which marks its position.

**Spectroscopic Examination of the Aurora of 4th February.**—Many communications have been received by the Academy of Sciences in Paris respecting this very fine aurora. M. Cornu noticed a yellowish-green band coincident with that observed by Ångström in 1867-68. M. Prazmowski also found a green band near Fraunhofer's line E, and possibly identical with Cornu's line, a red band near C, and two very faint ones in the blue and violet near F and G. M. Salet, in a paper sent to the Société chimique (*Revue scientifique*, 9th March, 1872) attributes the red line to the inversion of an atmospheric ray, and has not detected the substance producing the yellowish-green ray ( $\lambda = 557$ ). He examined the gas occluded by the Lenarto meteoric iron for it, but found only the rays due to hydrogen and carbonic oxide. It should be mentioned that several English observers have recorded in recent numbers of *Nature* their observations on the green line, and others in the more refrangible portion of the spectrum.

Mr. Backhouse, of Sunderland, states in the *Times* of the 9th instant that T Coronae Borealis, the star which in 1868 burst forth so suddenly and then waned to telescopic size, and which for the last two years has not varied perceptibly in brightness, is now fading still further.

## History.

**The History of the Norman Conquest of England, its Causes and its Results.** By Edward A. Freeman. Vol. IV. Oxford: at the Clarendon Press, 1871.

OWING chiefly to increasing difficulties, the progress made by this great work from the third to the fourth volume has been a little slower than is customary with its energetic author. However, the pause has not been to the disadvantage of the production itself. After having bestowed in the preceding volume a wonderful amount of learning, art,

and affection on one single year and its hero Harold, the author had to adhere to the proportion of the book as designed by himself from the beginning. The decisive catastrophe of Senlac is succeeded by the Conqueror's reign, and the current of events becomes both broader and at the same time more rapid. There are some who have objected to Mr. Freeman an overweening fervour for his favourite. They will now probably complain of a certain lack of admiration for William, which of necessity becomes more apparent in the course of the history of his reign. But are there not many reasons for a certain coolness on moral grounds as well as on critical? We would invite those critics to try the same nice balance of the original materials as it is applied by Mr. Freeman throughout this almost ponderous volume. Very probably they will agree with us that full justice has been done to the Conqueror in strict accordance with his real merits and demerits, with the increasing and declining elevation of his most extraordinary character. Is there, indeed, any due acknowledgment withheld from William, the most sagacious politician of his age? "In this present matter"—as supreme judge—"Aelfred and Cnut could have done no more than William did" (p. 368). Ever and again we are referred to the bright passages of his history, for instance his relations to Lanfranc, John the Italian abbot of Fécamp, and Vital of Westminster, which show him in the most favourable light (cf. 402). Upon William's refusal to do homage to Pope Gregory VII. even Mr. Freeman forgets for a moment the stern foreign ruler of the English. On the contrary he rejoices in the English spirit of the celebrated answer, which declined fealty, but faithful to precedent admitted the regular payment of Peter's pence. "The simple dignity, the crushing logic, of these few words of William the Great form a marked contrast to the foul calumnies and wild invectives which the partisans of Pope and Caesar were hurling at one another in other lands" (p. 433). Is there unfairness in the full view upon the darker side of such a man if we remember the greater prominence of this darker side during the later years of his rule, his genuine Norman cruelty in the harrying of Dorset or the sacking of the North, the exceptional capital punishment of Waltheof, his practical despotism, moving like that of Henry VIII., if possible, in strictly legal and constitutional forms, the state of *unlaw*, as the Peterborough Chronicle calls it, to which his consistent and harsh policy was in the end leading?

It is needless to enlarge upon the well-known sterling qualities of Mr. Freeman's historical art, his lucid arrangement of a very unwieldy material in the only adequate chronological order, and his forcible style, adopting occasionally as its pattern the Old English of the Chronicler (see the use of the epithet *stark*, pp. 316, 620). The author knows how to bridle the imaginative power, which so very often becomes fatal to the true objects of the historian. Sparing in mere conjecture, he provides the reader, if possible, in each case with the evidence for and against every particular conclusion, that he may judge for himself. Perhaps there is now and then a want of perspective in the importance attached to small matters and great, especially where minor personal, local, or antiquarian notices are chiefly used for filling up the gaps and breaks which unavoidably occur in our historical knowledge of a comparatively early century. Mr. Freeman aspires with a rare impartiality to the same accurate completeness in the different auxiliary disciplines, comparative philology and etymology, chronology and genealogy, diplomatic and legal antiquities, without a certain mastership of which the consummate writing of history is impossible. Throughout the volume again we trace the fruits of his favourite researches in architectural history, in geography,

and topography. It is quite characteristic of him that he should prefer "to look on a town as a whole with a kind of personal history, instead of simply the place where such and such a church or castle was to be found;" and to insert a special excuse why after having investigated most carefully every important place, Stafford had been by accident omitted (p. 318). Indeed, this even and scrupulous exactness of detail is the most eminent virtue of our author, as it is the basis and foundation of a truly methodical structure. There is no other work of an English historian which of late has won more readily the heart of the predominating historical school in Germany, not so much on account of its fervid Teutonism, but simply because by the application of strict scientific principles in sifting the sources it brings out successfully many points which have never been brought out before. There is no greater charm for the student than seeing from page to page in an abundance of notes, and in a copious supply of separate investigations reserved for the appendix, as in the former volumes, with how much skill and experience the materials are handled. A great deal of excellent minute criticism is bestowed on the Saxon Chronicles, the Worcester and the Peterborough copies, whose documentary value, as is well known, increases the nearer they approach their end; on Ordericus Vitalis, the *one* author who is English, French, and Norman at the same time, especially in his relation to the incomplete work of William of Poitiers; on William of Malmesbury; on the valuable Northumbrian interpolator, known generally by the name of Simeon of Durham, and on some other chief authorities. Perhaps it is not superfluous to point out the great assistance which an author like Mr. Freeman will necessarily derive from the great number of new editions, either in the series of the Master of the Rolls, Dimock's *Giraldus Cambrensis*, Luard's *Annales Monastici*, Hamilton's *Malmesbury (Gesta Pontificum)*, Stubbs' *Roger of Howden*, or separate as Mr. Hinde's *Simeon of Durham*, published for the Surtees Society, or Mr. Earle's excellent *Two of the Saxon Chronicles parallel*. And does there exist a more unique document for the Conqueror's reign than *Domesday*? Indeed, everybody without hesitation will subscribe the words (p. 691): "No other nation has such materials to draw upon for its history." It is utterly amazing what a mass of personal and local detail may be recovered from its incidental entries. Though referred to always and by everybody, *Domesday* has never before been so universally and on the whole successfully made use of as by Mr. Freeman. Besides elucidating the general tendency of the great survey, the legal fiction of the king, who never forgot to play the part of legitimate successor to Eadward the Confessor, the system of legal spoliation carried out with increasing rigour the more he pushed on his conquest north and west in the face of renewed rebellions and invasions—we meet with numberless inestimable touches, which, thanks to William's commissioners, have been preserved as belonging to great and small personages of the time, to localities and events. There may be, indeed, some cases where our author rather stretches his combinations of these notices beyond what is plausible. Certainly, he distinguishes most carefully between the different epochs of the Conquest, and by the very arrangement of his book insists on the interruptions which were occasioned by William's expeditions in Normandy and Maine, or by the chances of a more friendly intercourse with Malcolm of Scotland and even with Swend of Denmark, the chief protectors of so many English fugitives. But nevertheless there not unfrequently remains a margin of doubt and difficulty with respect to the chronology of entries in *Domesday* assigned with too little auxiliary evidence to particular dates between 1067 and 1086.

It is hardly necessary to mention that whatever has appeared in modern literature, English and foreign, bearing on the general subject or its details, has not been overlooked by our author. He reserves a special quiet humour, however, for Thierry's *Histoire de la Conquête*, bringing to book in the pleasantest way its more than romantic statements.

After speaking as we have done of the *technique* of the work, there remains but little space for the more common task of the reviewer. Moreover, Mr. Freeman has been long enough under the eyes of a very fastidious class of readers for them to have made up their minds about the intrinsic value of his writings. As for our own part, we confess that we have been attracted not so much by the more graphic portions of the volume, treating of the English and continental campaigns, of the personal history and dismal end of the Conqueror, as by the chapters which discuss the acts of the statesman. The glimpses into the municipal existence of such places as Exeter, Lincoln, Cambridge, Chester, and of certain early civic federations, whose independence fell a prey to the jealousy which never permitted his Norman and English tenants to accumulate much property in one and the same shire, are brought out in Mr. Freeman's happiest style. These and the other distinct causes by which England became permanently consolidated in a united kingdom appear with adequate clearness.

The few genuine remains of William's legislation are distinctly stated in perfect accordance with Professor Stubbs' *Select Charters*, p. 80. The great chapter on the ecclesiastical settlement, the combined church policy of William and Lanfranc, at once orthodox and yet independent, which Pope Gregory VII. himself did not venture to depreciate, stands like a gem set with natural and therefore the very best taste in the centre of the volume. As in William's dreary later years, the interest falls off fast owing to the severe and rapacious monotony of his despotism and the general change from victory to defeat, it is hardly otherwise with his later legislation. The midwinter gemôt at Gloucester in 1085-6 would never in constitutional interest reach up to the sciregemôt on Pennenden Heath in 1072 if the commission for the great survey had not been issued by the former. Yet these were the days in which the English Conquest struck root after all. Who will not regret that the general and special examination of *Domesday* in connection with the most palpable and the most enduring results of the Conquest, which just here would have been in their place in the text as well as in the notes of the appendix, had to be reserved for the next and last volume on account of the great bulk of the present. We doubt whether the author will be able to work out his epilogue in some seven or eight hundred pages more and still do full justice, as he promises, to Earl Simon and King Edward I.

We conclude with a few suggestions and corrections from our notes taken during a careful perusal of the most substantial book ever written on the subject, as it is not unlikely that one or the other may find acceptance in a second edition.

The author points out in two different pages (41 and 85) that the English, so famous themselves in the art of jewelry and gold embroidery, were supported by skilful Germans. He justly combines Will. Pict. 155, "Ad hoc incolere apud eos Germani solebant talium artium scientissimi," with several entries in *Domesday* about Theodoric or Tedric, "Otto aurifaber, Grimbaldus aurifaber." Some other foreigners settled in England by William, "Heppo balistarius, Odo arbalistarius" (pp. 215, 216), are most probably of the same origin, the name of the first being pure High-Dutch, and the same craft being represented very frequently by their countrymen in the later days of Henry III. and the Edwards.

Among the auxiliaries of Swend's expedition in support of the English insurgents in 1069, Ordericus Vitalis, 513 B.C., mentions Poles, Frisians, and continental Saxons, and goes on to say, "*Leutecia quoque pro Anglicis opibus auxiliares turmas mittebat.*" This is interpreted by Mr. Freeman, though with some reluctance, by *Lithuania*. With a zeal above praise he very rarely omits going to the very fountain-head in continental history as well as in English. If he had turned this time to William's contemporary, Adam the canon of Bremen, Pertz, vii. 312,\* he would have found: "*Ultra Leuticios, qui alio nomine Wilzi dicuntur, Oddara flumen occurrit, ditissimus amnis Sclavaniae regionis.*" An imperial statesman, Wibald Abbot of Stablo and Corvey, the contemporary of Orderic, writes in one of his letters, dated 1149: "*intraveramus cum armata milicia et exercitu christianorum principum terram Leuticiorum, transmisso Albi flumine;*" see Jaffé, *Bibliotheca Rerr. Germ.* i. 244. Here is meant undoubtedly the Slavonian tribe inhabiting western Pomerania, the country opposite the isle of Rügen. It is Orderic's ignorance, the reverse of Sir Walter Scott's in *Ivanhoe*, which makes them worship Teutonic deities instead of their national Czerni Bog.

The volume, as it appears, retains more misprints than commonly occur in the excellent works issued from the Clarendon Press: e.g. p. 349, No. 3, Paul Bernfried instead of Bernried; and p. 423, No. 2, Pertz, iii. 362, instead of Pertz, vi. 362.

Now and then Mr. Freeman prefers an inferior text, when a better was at hand; cf. 435, 436. Everything that Dr. Giles has edited—and his edition of Lanfranc's Letters does not make an exception—is done in a most slovenly manner. A letter of Gregory VII. to the archbishop, quoted p. 411, No. 2, occurs likewise in the much safer text of the *Registrum Gregorianum*, edited by Jaffé, *Bibliotheca Rerr. Germ.* ii. 49, and there is not the least doubt that *vii nostrâ* is to be altered into *vice nostrâ*, and the perfectly inadmissible *singulis* into *singularis*. But it is much the same with the copies of papal letters in Labbe's *Concilia*. In an epistle of Hildebrand, quoted p. 431, No. 2, is to be read: "*Haec ideo, karissime, tibi inculcavimus,*" see Jaffé, ii. 89; and in another place, quoted p. 431, No. 3, and dated most precisely May 8, 1080: "*ut cura et dispensatione apostolica dignitas post Deum gubernetur regia,*" Jaffé, ii. 419, instead of the falsified sentence: "*ut cura et dispensatione apostolicae dignitatis post Deum gubernetur regia.*"

With regard to the coronation of the Emperor Henry IV. at Easter 1084 or 1085, we are referred to the authorities collected by Struvius, i. 389, about 150 years ago. There is now not the least doubt about the year, as we have a charter of the emperor himself, dated from St. Peter's, March 21, 1084. See Stumpf, *Die Kaiserurkunden des 10., 11. und 12. Jahrhunderts*, No. 2854; and Giesebrecht, *Geschichte der deutschen Kaiserzeit*, iii. 1122.

Mr. Freeman shows exceedingly well what is to be thought of the alleged design of Anno, Archbishop of Köln, to make William the Conqueror interfere in Germany, and of Henry IV.'s wish to win him over in conjunction with the King of Denmark as an ally against his own rebellious Saxon subjects—stories told in different versions by two German authors of the time, Lambert of Hersfeld, and Bruno, *de Bello Saxonico*. As for the first, Mr. Freeman, p. 539, joins the praises of Dean Milman, *History of Latin Christianity*, iii. 168: "whom no incompetent judge has placed at the head

\* Page 356 of the same author is also worth referring to, as it contains the contemporary opinion in Germany concerning Harold and the reforms carried out by William the "Bastard" and Lanfranc the "Philosopher."

of all the historians of the middle ages." This unqualified laudation is out of date at least with German critics, especially since Ranke's paper in the *Transactions* of the Berlin Academy: *Zur Kritik fränkisch-deutscher Reichsanmalisten*, 1854. See Wattenbach, *Deutschlands Geschichtsquellen im Mittelalter*, 321 ff. 2nd ed.

R. PAULI.

**History of the Imāms and Sayyids of Omān** by Salil-Ibn-Razīk, from A.D. 661–1856. Translated from the original Arabic, and edited, with notes, appendices, and an introduction, continuing the history down to 1870, by G. P. Badger, F.R.G.S., late Chaplain in the Presidency of Bombay. With a Map. Printed for the Hakluyt Society.

THE geographical position of Omān, the south-eastern corner of Arabia, to the history of which the present volume is devoted, is a very isolated one. A range of mountains traverses the whole country from Rās-Musandim to Rās-alḥadd, dividing it into an eastern part from the mountains to the sea, and a western part the limits of which disappear in the great desert Al'ahkâf. The former with the important towns Maskat, Almaṭra, Alrastāk, and Sohâr, is chiefly the territory of Omānī history. There is scarcely any natural connection between Omān and the countries to the north (Albahrain) and south (Mahra, Ḥaḍramant, and Yemen). Hence Omān has always been very slightly affected by the fate of the remainder of the Arabian peninsula. It led a life by itself, and was more concerned in the affairs of Persia, Balūcistān, and India than of Syria and Mesopotamia, the chief theatres of Muhammadan history.

Omān did not submit to the authority of the khalifs of the house of Omayya till the time of 'Abd-almalik (died A.D. 705), under whom the famous Alḥajjāj, then governor of Irāk, succeeded in subduing it. But not more than half a century later (A.D. 751) the Omānīs threw off this yoke under the first of the Abbāsīde khalifs; they elected a ruler from the tribes of their country, and have always, from that time till the present, been independent of the whole Muhammadan world. Their war of liberation was brought about not only by political, but also by religious motives. A sect of the Khawārij, who derive their system and name (Al'ibādīyya) from one 'Abdallāh b. 'Ibād Tamīnī, spread over the whole of Omān towards the end of the rule of the Banū Omayya. Native leaders seem to have favoured this movement, and the war against the generals of the Banū Abbās was not only one against foreign intruders, but also a war against a different confession, the Sunnite Islām. The 'Ibādī creed has ever since been the state religion of Omān.

The chief object of the author of this chronicle, called "A plain and authentic exposition of the Chronicles of the Sayyids of the Āl-Bū-Sa'id" (*sic*), was to narrate the history of Sa'id b. Sulṭān, who ruled over Omān and Zanzibar A.D. 1804–1856. In the third book he treats exclusively of this prince, whilst in books i. and ii. he delineates the previous history of the country. The first book extends from A.D. 751–1741, containing an account of the princes who were elected from the tribes 'Azd, Yaḥmad, Kinda, Nabḥān, Hinā, Ya'rūb, and Ghāfir. In some parts the account is very meagre. For the period A.D. 1154–1435 we get only scanty extracts, not even a list of the rulers of the country. It is of some interest to learn that it was as far back as the time of 'Abdalmalik (died A.D. 705) that some Omānī tribes, on being pressed by the generals of Alḥajjāj, emigrated to Zanzibar, which from that epoch till A.D. 1856 formed a dependency of the empire of Omān. The first volume concludes with the history of the rise of the family Āl-Bū-Sa'id, who still hold sway in Omān and Zanzibar. The founder of this

dynasty, 'Aḥmad b. Sa'id, seems originally to have been a rich and influential merchant, who first came into power towards the end of the rule of the Ya'rūbī dynasty. Whilst the sovereigns of the latter ruined each other by endless intestine broils, the Persians invaded the country A.D. 1737, under pretence of bringing aid to one of the contending parties. They ravaged the whole country indiscriminately for several years, and it was 'Aḥmad, then commander of the fortress Sohâr, who succeeded in expelling them A.D. 1741. In recognition of his eminent services, the people elected him ruler of the country. The second book contains the history of his reign and that of his descendants from A.D. 1741 as far as 1804.

The first two books were composed during the reign of Sa'id b. Sulṭān (that is, before 1856), and dedicated to a nephew of this prince, Sayyid Ḥāmid b. Sālim b. Sulṭān. The third book was composed after the death of Sa'id (19th October, 1856), whose history it contains. But it was not finished by the author himself, because at the end there is a note, dated 12th December, A.D. 1857, stating that it was finished by one Ḥāmid b. Muḥammad b. Razīk, whilst the name of the original author is Salil. Accordingly Salil must have died between 19th October, 1856, and 12th December, 1857, and his work was finished by a relative of his, as we shall see hereafter.

Mr. Badger calls the author, on the authority of his MS., Salil-bin-Razīk. But this is a mistake for Salil b. Muḥammad b. Razīk. The author speaks in several places of his father and grandfather, who held successively the post of clerk of customs at Maskat, and played a not insignificant part in the history of Omān (*v.* pp. 135, 148, 153, 158, 165, 204, 216, 222); his grandfather he calls Razīk b. Bakhit, his father Muḥammad b. Razīk. Hence it seems evident that that Ḥāmid b. Muḥammad b. Razīk, mentioned in the note on p. 370, who continued and finished the work of Salil was his brother.

Originally the ruler of Omān was called 'Imām. He was the religious and political head of the people and freely elected—according to the tenets of the 'Ibādīyya creed—but "with a strong preference to the ruling family over strangers, and with a strong preference in favour of the son, not necessarily the eldest, of the last 'Imām over the other members of his family." This title has become obsolete since the death of Sa'id b. 'Aḥmad (between 1811 and 1821). During his actual rule, from A.D. 1775–1779, he made himself so odious to his people that his son Ḥāmid found it easy to insinuate himself with the people of Omān, and gradually obtain possession of all the forts, including Maskat. Ḥāmid was acknowledged by all the chiefs; he resided at Maskat, and governed the country as an independent chief till his death in 1792. He retained his former title "Sayyid," which means "Prince of the royal house," as all his successors have done up to the present time. Meanwhile his father Sa'id, the legitimate 'Imām, lived in retirement without having any influence on the affairs of the country, at Alrastāk, and died unnoticed, between 1811 and 1821. By his death the 'Imāma became vacant, but it has not been filled again. The 'Imāma was superseded by the Siyāda; the name being changed, the office remaining the same.

Mr. Badger has doubtless rendered an important service to the history of the East by translating this work of Salil. With the exception of a portion of "the opening book, which consists mainly of genealogies of the Arab tribes of Yemen, and a few irrelevant episodes and laudatory poems," he has translated the whole. In the foot-notes many explanations are added, and the appendices, "On the Title of 'Imām," "The 'Ibādīyya," "An Account of the Murder of 'Alī," will

be found very useful for the general reader, though they scarcely contain anything that is new to the professed scholar. For the benefit of those who find it tedious to wade through the monotonous account of the Arab chronicler, Mr. Badger has composed a history of Omân of his own, based upon Šalil's work. And this part ("Introduction and Analysis") is particularly valuable, because he has added an account of the latest history of the country from 1856 till 1870. For this task he was eminently fitted, being acquainted not only with the country, but also with several of its leading men, for all which interesting matter we may refer to the "Editor's Preface."

Not knowing the Arabic original whence this translation was made, we cannot judge whether it is accurate or not; but we can say this much, that it is very readable. Regarding the numerous geographical names, the pronunciation of which was not always certain, we should have advised the translator to give not only his mode of reading them, but also the Arabic forms, as he found them in his MS. In doubtful cases this would have greatly facilitated any attempt at emendation. A very valuable portion of his work, which contains such a store of positively new information, is that referring to the relations between the Wāhhābīs and Omân, which will have to be carefully perused by the future historian of Wāhhābism. Lastly, we may mention that Mr. Badger frequently criticizes the "brilliant pages" (as he calls them) of Palgrave's *Central and Eastern Arabia*. He proves that all the assertions which Palgrave makes regarding Omân are just "a tissue of fallacies from beginning to end"—notwithstanding which he loads the author with compliments!

ED. SACHAU.

### Contents of the Journals.

*Revue des Questions Historiques*, Jan. 1.—Contains an article on Charles of Blois, Duke of Brittany, trying to refute the charges against him on the ground of his pious character. Unhappily this was in that age compatible with excessive cruelty and many acts that we should consider monstrous.—A better notice follows on Augustin Thierry's mode of interpreting the Frankish proper names.—A summary is given of some new works on Massillon, and a reply made to the recent attempts at rehabilitating Pope Alexander VI. (Borgia).—In a notice of the *Gallia Christiana* the writer complains that Haureau, the continuator of that great work, does not allow, any more than the able Benedictines whose work he has continued, "the apostolical origin of certain churches in Gaul."

*Theologisches Literaturblatt*, Feb. 12.—Contains an interesting review by v. Schulte of Zoepffel's *Papal Elections and the Development of their Ceremonial from the Eleventh to the Fourteenth Century*. (See notice by Prof. Pauli in *Academy*, vol. ii. p. 561.)—A notice follows of Nikolaus von Flüe, the Swiss soldier who became a hermit, and had great influence among his countrymen, which he showed especially in the important meeting at Stans, Dec. 22, 1481. His life illustrates the epoch of Charles the Bold of Burgundy, when the Swiss became a leading power in Europe.

*Literarisches Centralblatt*, Feb. 10.—Contains a review of Ranke's important book, *Der Ursprung des siebenjährigen Krieges*, which we shall notice ourselves very shortly. The influence of the Jesuits on Louis XV.'s mistress, Madame de Pompadour, in bringing about a close union of the Catholic powers, is specially noticed.—Feb. 17.—Analyses Büdinger's *Untersuchungen zur mittleren Geschichte*, which criticises the mediæval chroniclers Liudprand, Bishop of Cremona, Ruotger, &c.—March 2.—Notes Palacky's *Zur böhmischen Geschichtsschreibung*, an account of his literary life and difficulties. He had to pay Monsignor Marini, the head of the archive department at the Vatican, nearly all the sum allowed him for his journey to Italy; and the censorship at Vienna made him blame John Huss's "obstinacy and pertinacious self-will," though Palacky's account of Huss by no means corresponded to this character of the great Bohemian reformer.

*Gött. gel. Anzeigen (Nachrichten)*, Feb. 14.—Dr. Matz communicates an account of "Early Lists of Antiques," which are as valuable for the history of art as the early manuscript collections of inscriptions are for the *Corpus Inscriptionum*. Some of these lists are among the Queen's collections at Windsor.—Wachsmuth reviews Schmidt's *Das Volksleben der Neugriechen und das hellenische Alterthum*.—Feb. 21.—Tobler reviews Paul Meyer's *Les derniers Troubadours de la Provence*. The use made of some of them by Nostradamus is noted

as curious.—Liebrecht analyses *La Leggenda della Reina Rosana e di Rosana sua Figliuola*, an Italian version of the romantic old French story of "Flore and Blanche-flor," but with a more religious tone infused into it.

### Philology.

*New Date for the Jerusalem Talmud*. [*Gib'eth (Gib'ath) Jeruschalaim*. Eine Studie über Wesen, Quellen, Entstehung, Abschluss und über den Verfasser des Jer. Talmuds, von J. A. Wiesner. Wien.] In Hebrew.

It is only a short time since Prof. Grätz surprised us by announcing the late composition of Ecclesiastes (*Academy*, vol. ii. p. 476), and the Canticles. Scarcely recovered from the shock, we are informed by Rabbi Wiesner, well known by his learned scholia on part of the Talmud of Babylon, of an equally surprising result about the Talmud of Jerusalem. Up to the present time, as we have had occasion to state in the *Academy* (vol. i. p. 192), this Talmud was believed to have been compiled in the first half of the fifth century. Rabbi Wiesner, however, produces striking arguments to show that its compiler imitated the Talmud of Jerusalem, which was finished somewhere about 600 A.D. In a review cited above, we have mentioned the remarkable fact that the two Talmuds do not quote one another. Now, if the Jerusalem Talmud had been written in 450, the doctors of Babylon must have been aware of it, as there was a pretty regular communication between the two countries. On the other hand, if it was a plagiarism, the absence of quotations was necessary to give it an appearance of antiquity. Here is another link in the chain of evidence. It has been conclusively shown by Rapoport (the late chief rabbi of Prague), as well as by Dr. Frankel, the profoundly learned director of the rabbinical school at Breslau, that neither Simon of Kairowan nor R. Aha of Sabha (in Babylonia), both of the second half of the eighth century, had any notion of the existence of a Jerusalem Talmud. The latter, who migrated to Palestine, where he died, ought certainly to have heard something of the Talmud of Jerusalem—a fact which makes it all but certain that the process of compiling it was not ended before 760, the date of R. Aha's treatise called *Shedthoth*. We must now advance another striking fact. The well-known R. Saadyah Gaon (tenth century) appears to have learned the existence of this Talmud from the Karaite Salmon ben Y'ruham, who brought it from Palestine to Babylonia. Again, R. Haya Gaon in Babylonia (eleventh century), as Rapoport has observed, either did not know the Talmud of Jerusalem at all or knew it imperfectly. Now, is it conceivable that the Geonim, living after the close of the Talmud of Babylon, and spending their lives in commenting on this Talmud, making compendia and settling questions of casuistry from it, should have ignored an earlier Talmud, composed on holy ground? They could not certainly have been influenced by a dislike to the ancient Palestinian schools, such as led the doctors of the Talmud of Babylon to ignore that of Jerusalem, according to some critics. And now let us turn to the evidence supplied by the Talmud itself. The compiler, as Rabbi Wiesner shows, was imprudent enough to leave several indications of recent origin, e.g. Karaite interpretations of the Law (the Karaite

sect is known not to have begun earlier than 754). Again, the Talmud of Jerusalem has liturgical formulae, and references to synagogue-usages, not known to the doctors of the Babylonian Talmud. It also gives directions for fixing the times of the feasts by astronomical calculations, introduced probably not earlier than the end of the eighth century, for previously they were fixed by the new moon, as they are still among the Karaites. It would even follow from one passage that the compiler was acquainted with the vowel-points.

We are quite prepared to be told by conservative critics that all the above-mentioned passages are interpolations, for Rapoport has proved that there are many interpolations in the Talmud of Babylon. But what can be said to the numerous passages, cited by Rabbi Wiesner, where the Talmud of Jerusalem is in flagrant and deliberate contradiction to that of Babylon? Besides, a large number of passages in the Talmud of Jerusalem are incomprehensible, until they are explained by parallel places in that of Babylon. Either there are frequent omissions in our copies of the Talmud of Jerusalem, which is improbable, or, as we think, the compiler wrote against time, and made nonsense in shortening passages of the other Talmud, which perhaps he also misunderstood. He even goes so far in his imitation as to speak of two revisions of the Jerusalem Talmud, because it is stated that the Talmud of Babylon was thrice revised by R. Ashi, its first compiler. Rabbi Wiesner makes no remark on the language of the Jerusalem Talmud, which seems to us to be artificial, and of late date. It has much resemblance to that of the Samaritan Targum. Neither does he make any suggestion as to the author's object in the mystification. That problem he leaves for the historians. It is remarkable, however, that the Geonim have always shown a certain reserve in the use of this Talmud. They quote it but seldom, and whenever it contradicts the Talmud of Babylon, they blindly follow the latter. Dr. Geiger has asked, How could R. Saadyah and others have been taken in by such an imposture? but the venerable delusion, which is far from being extinct, about the *Zohar*, and many another like it, supplies an answer. Only thirty years ago that famous Cabbalistic book was ascribed to R. Simon ben Yohai (second century), but critics are now agreed in bringing it down to the thirteenth century. May we not add that personal ambition goes far to explain the origin of such mystifications? We now await the criticisms which Rabbi Wiesner's pamphlet cannot fail to elicit from Dr. Geiger, Prof. Grätz, and others. If his idea should be confirmed, Talmudic philology will appear under a new light, and the parallel between sayings of the Gospels and the Talmud of Jerusalem must be definitely set aside.

AD. NEUBAUER.

*Inedita Syriaca.* Eine Sammlung syrischer Uebersetzungen von Schriften griechischer Profanliteratur . . . herausgeg. von Dr. Ed. Sachau. Wien, 1870.

THE scantiness of the profane element in Syriac literature is a fact which has not yet been adequately accounted for, though its explanation naturally presents itself to anyone long conversant with the authors of Syria. It is the Christian spirit that pervades their works which supplies the key to their selections from Greek literature; it is this which enables us to understand their preference of Aristotle, Plutarch, Lucian, and Themistius to the brilliant but distinctively pagan creations of the Attic muse. The few profane works extant in Syriac are mostly translations from the Greek, and these are seldom complete; Aristotle himself, notwithstanding his immense reputation in the age when Christian Syria was in her bloom, and Mussulman Asia was reposing from

conquest in the pursuits of literature, never had the distinguished honour of an entire translation.

And even the Nitrian manuscripts deposited in the British Museum, though they reveal to us works of whose existence we had no suspicion, would only supply the material for two such volumes as the *Inedita Syriaca*.

Dr. Sachau has formed the design of supplementing the texts already published by Prof. de Lagarde and Prof. Land. A treatise of Lucian on *Calumny*, two discourses of Themistius on *Virtue*, and on *Friendship*, some sentences extracted from the works of Plato, some proverbs, or aphorisms of moral philosophy, of more or less doubtful authenticity, make up the contents of his book.

This simple statement shows the justice of the observations we made respecting the principle which directed the Syrian translators in their selection. It is the more necessary to give this a passing notice as it finishes the only reasonable explanation of a fact which has drawn some censure on the translators: we mean the licence exercised by them in modifying, abridging, or partly omitting, the original texts. This procedure is the more surprising as they show themselves in other places to be models of fidelity. But our surprise ceases when we perceive that these arbitrary changes are limited to words capable of wounding the pure and delicate feelings of Syrian Christians, to facts calculated to scandalise a Christian imagination, to allusions, obscure, or too closely connected with pagan mythology.

The want of exactness in the Syrian translator is therefore not the result of negligence or incapacity, but of a preconceived idea, a definite system. And let it not be supposed that this is a groundless hypothesis. A collation of a few passages of the *Inedita Syriaca* with the Greek will amply justify our assertion. For instance, the four inaccuracies in the first six chapters of Lucian's work on *Calumny* can only be thus accounted for. When the Greek reads, τοιγάρτοι μυρίας ἤδη τοῖς τραγωιδασκάλοις ἀφορμαὶ εἰς τὰ δράματα τὸ τοιοῦτο παρέσχηται, τοὺς λαβδακίδας καὶ τοὺς Πελοπίδας καὶ τὰ τοῦτοις παραπλήσια· σχεδὸν γὰρ τὰ πλείω τῶν ἐν τῇ σκενῇ ἀναβαινόντων κακῶν εὐροὶ τις ἂν ὑπὸ τῆς ἀγνοίας καθάπερ ὑπὸ τραγικοῦ τινος δαίμονος κεχορηγημένα· λέγω δὲ καὶ κ.τ.λ.—the translator merely says, "It is by ignorance that we furnish the material for so many sad stories relating to us" (*Ined. Syr.* p. 1, l. 2; cf. de Lagarde, *Abhandl.* p. 120, &c.). A little further on (p. 3, l. 23), after the words, "This statue had large ears," the translator has omitted an allusion only intelligible to a reader familiar with Greek mythology, μικροῦ δὲν τοῖς τοῦ Μίδου προσεικότα. P. 4, l. 7, the Greek has, "The young man called on the gods," τοὺς θεοὺς, where the Syriac reads God, in the singular. Lower down we find this incident of the Greek text omitted as useless, ὥς δέ μοι καὶ ταύτας ἐμήνυσεν ὁ περιηγητὴς τῆς εἰκότος.

The Syriac is beautifully printed, and as correct as can fairly be expected. I should, however, propose some alterations, e.g. p. 30, l. 4, *esh'kofo* for *lo sh'kofo*; p. 30, l. 17, *Estilpon* for *Estipon*; p. 32, l. 20, *m'shalet* for *m'shatel*; p. 35, l. 10, *saghié* for *saghé*; p. 49, l. 3, *Qoulossaiconn*, with the Greek, for *Qoulossaihoun*; p. 53, l. 16, *neb'har* for *neb'ar*; p. 82, l. 10, *mesh'tah'ion mesh'tahein* for *mesh'tah'ion mesh'ta'in*. I do not think, with Dr. Sachau and M. Renan, that Theodore, metropolitan of Merou, is the person to whom Sarghis of Rish-ain addressed his treatise on Astrology, but space compels me to reserve my reasons for differing from these eminent scholars.

These remarks, far from attenuating the merit of the *Inedita Syriaca*, prove on the contrary that I have read the book with care, and found it interesting, and I am persuaded that the same interest will be shared by all who have the

courage to approach a Syriac text, often difficult, without the aid of a translation. The style however is pure and elegant, and belongs to the best epoch of Syrian literature. Some slight palaeographical indications preserved in the printed text seem to reveal a Nestorian rather than a Jacobite or Melchite origin. But we refrain from expressing an opinion on this point, as well as from offering a conjecture as to the author.

The appendices contain several other fragments of translation or original works, the principal of which will raise one corner of the veil which still hangs over the eminently Oriental and Assyrian science of Astrology. We have only to add that lexicographers will find in the *Inedita* an abundant harvest of new words or meanings, and that grammarians will meet with certain forms noticed as frequent in neo-Syriac, e.g. p. 3, i. 9, *Azil leh*; p. 18, l. 15, *Azil li*. Once more we congratulate Dr. Sachau on his valuable publication.

P. MARTIN.

W. Dindorf's Greek Dramatists and Lexicon on Sophocles. [*Poetarum Sceniorum Graecorum, Aeschylus Sophocles Euripides et Aristophanis fabulae superstites et perditarum fragmenta. Ex recensione Guilelmi Dindorfii. Editio quinta correctior. Lipsiae: Teubner, 1869.—Lexicon Sophocleum. Edidit Guilelmus Dindorfus. Lipsiae: Teubner, 1870.*]

PROFESSOR W. DINDORF'S edition of the Greek dramatists is almost too well known to require much recommendation, even if the work were not so completely changed and improved in its fifth edition as it actually is. The first edition, published in 1830 by Messrs. Black and Young, contained a very unpretentious text of the four dramatic poets, with a very brief collection of the fragments. A second edition, considerably revised and augmented, appeared at Oxford, 1851, and the so-called third and fourth editions subsequently published by Messrs. J. H. Parker and Co. are no more than repetitions of the second, without any further improvements or additions by the editor. It is, however, for this reason that the new Leipzig edition (which is to all intents and purposes quite a new work) appears under the title of *editio quinta*. It is necessary to inform English purchasers that the new Leipzig edition is so much superior to the Oxford editions (be they styled *tertia*, *quarta*, or even *quinta*) as to render it a perfect waste of money to buy a mere reprint of a work now given up and superseded by the editor himself.

The difference between the two works is easily perceived. In the new edition the text of the dramatists is very carefully revised, and almost every page attests the accuracy with which the editor has availed himself of the numerous editions, emendations, and commentations published since 1851. In Aeschylus we find frequent mention of Heimsöth and Weil, and many of their readings appear now in the text; in Sophocles, Nauck, Linwood, and Blaydes are quoted, and even among the innumerable conjectures of the latter, Prof. Dindorf has succeeded in picking out some of genuine excellence; in Euripides, Hirzel's investigations on the anti-thetic composition of the *diverbia* are carefully made use of, and Badham's, Paley's, Weil's, and Nauck's editions are often quoted. Those who have an idea of the great multitude of conjectures annually proposed on Sophocles and Euripides alone, both in philological journals and separate treatises, will be surprised to see with what perseverance the editor has pursued his subjects, and will thank him for selecting valuable emendations out of the chaotic mass of rubbish with which this kind of literature is sadly overlaid. We advise the possessors of Nauck's edition of Sophocles (in the Weidmann series) to compare his so-called critical notes with Dindorf's commentary, and we trust that they

will not fail to admire the unerring tact with which our editor discriminates the grain from the chaff.

Professor Dindorf's own criticism is, on the whole, as conservative as we believe that his nature and learning will ever allow it to be. A man who has edited and re-edited the Greek dramatists so many times during the last fifty years may be supposed finally to acquire a very great familiarity with them, which may embolden him to venture sometimes on re-writing rather than emending them in very difficult passages. Such readings as *λύζω*, Aesch. *Agam.* 14, and *γυναικας τλαι μηδ' ανειμένας εαν*, Soph. *Ant.* 579, may be in the spirit of the poet, nor are they to be condemned as mere intuitive guesses at the original reading of the text, but in the present state of our MSS. emendations of this kind can scarcely be admitted as *sound* criticism. We are, however, glad to find that the editor generally restrains this ingenious bent with all his usual soberness of mind, except in the choral parts of Aeschylus, and there we may as well admit that in ever so many places sober-minded criticism ends and guesswork begins.

The critical apparatus is considerably simplified by the important discovery (which is to a great extent Dindorf's) that in Aeschylus and Sophocles we should only follow the Medicean MS., whose readings we find here, as far as they appear to influence the criticism of the text. In Euripides the MSS. are neither so good nor so easily valued and classified, but in Aristophanes we depend on two good MSS., the Ravenna and Venetian.

In the Prolegomena the editor treats of the metres and the prosody of his poets—a part of the work especially useful to the student. We should also add that the fragments appear in the new edition in far greater completeness than in the English editions of 1851.

In his preface Prof. Dindorf promises to publish annual supplements to his critical notes in Fleckeisen's *Jahrbücher*. It would be desirable to issue these supplements separately, so as to enable the purchasers of the present work to follow the development of the criticism of their authors. Another promise made in the preface has already been partly fulfilled by the editor. The indefatigable firm of Messrs. Teubner are going to publish a series of lexicons in connection with the new edition of Dindorf's *Poetae Scenici*, in which Dindorf's text will be used as basis, though these lexicons will also contain original emendations caused by renewed consideration of the readings of the MSS. and grammarians. The *Lexicon Sophocleum* has already made its appearance, and a *Lexicon Aeschyleum* is, we are told, in active progress. The *Lexicon Euripideum* will be by a number of young scholars, though we believe that the general arrangement and direction are entrusted to a gentleman well-known among his friends as a most careful student of Euripides. The readers of our journal may be aware that the *Lexicon Sophocleum* has caused a quarrel between the proprietors of Ellendt's well-known work and Professor Dindorf, and that the matter is likely to be tried by law. We cannot understand how the editor of the new lexicon can be deemed guilty of plagiarism in any sense, as his work is original *so far as the circumstances allow of originality*. Ellendt's book being a very careful, but somewhat awkward and tedious work, Prof. Dindorf has contrived to give more matter in less space. It is of course unavoidable that his quotations should, as a rule, agree with those of Ellendt; but first of all, his explanations and comments, as a rule, do not coincide with Ellendt; on the contrary, while Ellendt often wanders from his point, Dindorf is always concise and to the point, and in many instances illustrates his opinions with original matter. One of his chief merits consists in his Latin translations, which have generally appeared to us

to be the very best it was possible to give, while Ellendt's translations are mostly vague. We have not the slightest doubt that students of Sophocles will soon learn to prefer Dindorf's work to Ellendt's, and hope that the *Lexica Aeschylea, Euripidea, and Aristophanea* will not be delayed too long, as the fifth edition of Dindorf's dramatists and these lexicons together will form an invaluable work for the student of the Greek language in general, and of these poets in particular.

W. WAGNER.

### Intelligence.

*Anglo-Saxon Prose Texts.*—Dr. Grein, the well-known editor of the *Bibliothek der Angelsächsischen Poesie*, has just put forth a prospectus for a new edition of all the Anglo-Saxon prose that has been hitherto printed, to be called *Bibliothek der Angelsächsischen Prosa*. He thinks that this will lay the foundation for a future new Anglo-Saxon dictionary. So extensive a scheme will of course occupy a great number of volumes. In the first volume, he proposes to reprint Thwaites's edition of the Heptateuch, that is to say, the Pentateuch together with the books of Joshua and Judges, as well as the Homily on Job. But it does not appear that he will include the Apocryphal Gospel of Nicodemus, which is to be found in Thwaites's volume. In his second volume, he proposes to reprint the translations of the Psalms, edited by Spelman and Stevenson; and, in his third volume, the prose paraphrase of Psalms i.-l., as edited by Thorpe, together with several smaller pieces, including Aelfric's Grammar. No further volumes are as yet announced. We may remark that the scheme is by no means satisfactory. A mere reprint of old editions in which all the mistakes and misreadings of editors are reproduced, with foot-notes containing conjectural emendations, is not a work to which we look forward with much anticipation of advancing the study of Anglo-Saxon or with much confidence. Many of the works ought to be completely re-edited from MSS. as yet unused or insufficiently used; and a great improvement of the texts might be made in some cases by careful collation. But if Dr. Grein is resolved to do no more than go over the old ground, the very least that ought to be done is to consult the MSS., and to remove editorial errors and misprints. Possibly, he relies upon his own knowledge to remove such mistakes, but this is not at all what we should wish. Much trouble and ingenuity are often expended in making "conjectural emendations," which might have been saved by mere reference to the original itself; and hence the whole scheme is a very disappointing one. Even a little verification of the texts would be better than none at all; and we strongly recommend Dr. Grein to consider this point before he proceeds to patch up his reprints by *guessing* at the whereabouts of the errors that have been committed.

Dr. E. Baehrens, a young German scholar already favourably known to philologists by several contributions to the *Rheinische Museum*, is at present engaged on a new edition of the *Panegyrici latini*, which is to appear in the Bibliotheca Teubneriana. As there are no old MSS. known of these authors, an editor is entirely reduced to the copies made in the fifteenth century. One of these is found among the Harleian MSS., No. 2480, and it would be desirable that it should be used in the new edition.

Professor Theodor Nöldeke, of Kiel, has accepted the appointment of professor of Oriental languages at the university of Strasburg.

Professor A. Kiessling, the well-known editor of Dionysius Halicarnassensis, is about to leave Hamburg, where he has been professor at the Johanneum for the last three years, having accepted a chair at the university of Greifswald, in the place of Professor W. Studemund, who is going to Strasburg.

Dr. E. Hiller, of Bonn, is about to publish a new collection of the fragments of Eratosthenes.

M. E. Legrand and M. Gidel are to be the joint editors of a recently discovered mediaeval Greek poem in about 600 trochaic lines, to which five political lines are prefixed. M. Legrand has also discovered a second MS. of the poems of Sachlikis, which represents quite a different text from the Paris MS. The MS. bears the subscription *επελειώθη δ Ζαχαρικήs (sic) διὰ χειρὸς ἐμοῦ φρά Νοῦλ δὲ λὰ Μπρῶ ἐκ τῆς Ῥόδου καβαλλάρης*.

The premature death (Feb. 24) of Dr. M. A. Levy, professor at Breslau University, will leave a gap difficult to supply in the ranks of Semitic philologists. His rare talent for the decipherment of inscriptions is borne witness to by numerous dissertations, among which we need only mention *Die palmyrenischen Inschriften*, *Phönizische Studien*, *Phönizisches Wörterbuch*, and *Siegel und Gemmen mit aramäischen, phönizischen u. s. w. Inschriften*.

### IN MEMORIAM.

By the death of THEODOR GOLDSTÜCKER, at the early age of fifty-one, Philology has lost one of its greatest scholars, and Society, what it can still less afford to lose, one of the noblest and most disinterested of men. The pupil successively of Peter von Böhlen, Lassen, Schlegel, and Eugène Burnouf, the collaborator in the particular matter of Hindu philosophy, of Humboldt in the *Cosmos*, Goldstücker came over to England after the reaction of 1848-9, for the purpose of assisting Professor Wilson in the preparation of a new edition of his Sanskrit dictionary. For this new edition no material whatever existed save the dictionary itself in its printed form. Goldstücker, nevertheless, undertook its revision single-handed; and the immense proportions which under his hand the first six parts assumed (480 pp. without getting to the end of the first letter) rendered the completion of the work by one man or in one generation impossible. Many thousands of notes and references, for this and other works, the result of an unremitting study of the MSS. treasures at the India House, &c. are left behind; and we are glad to be able to state with certainty that the report in some of the newspapers that the deceased had left directions in his will for their destruction is without foundation. Nothing however will be published without the authorisation of Professor Cowell, of Cambridge.

It is well known that Goldstücker had compiled a comprehensive index to the principal grammatical works connected with Pāṇini, as well as a complete index of Kālidāsa's works, the publication of which might help to solve not a few philological problems. His knowledge of the Sanskrit grammarians, especially of Pāṇini, was and will probably ever remain unrivalled. His views on Pāṇini are expressed in the preface to his facsimile edition of the *Mānava-kalpa-sūtra* (1861): see also *Academy*, vol. i. p. 269. For the last two years he has been engaged in carrying through the press, for the Indian government, a photo-lithographic edition of the *Mahābhāṣya*, of which 300 pages still remain to be done. By his decease, what may be called the "traditional" school of Vedic criticism, which gives to the interpretations of native tradition the preference over those derived from comparative philology, ceases to have a European representative. His manuscript of a Sanskrit grammar has long been finished; and it is hoped that this work, which is likely to revolutionise the teaching of Sanskrit in many respects, may be allowed to see the light. The great psychological value as an educational instrument which he attached to the Sanskrit language, if properly taught, was well known to his friends; and it was through his advocacy that a committee of the professors of University College, London, was appointed to report on the desirableness of making Sanskrit an integral part of all the degree examinations in the university of London.

Of the philosophical literature of India, the *Mīmāṃsā*, from its close connection with grammatical researches, engaged his chief attention; some fruit of his labours in this field is a nearly finished edition, prepared for the Sanskrit Society, of Mādhava's *Jaimintya-nyāya-mūla-vistara* (1865).

It was however Goldstücker's thorough familiarity with the legal and ceremonial literature of the Hindus which rendered his advice of so much value to the Indian government. A paper recently published by him, *On the Deficiencies in the Present Administration of Hindu Law* (Trübner, 1871), contains an exposure of the frequent failures of justice arising from the misunderstandings of native codes, which disgrace our Indian administration.

Besides some papers in the *Reader* and the *Athenaeum*, Goldstücker contributed an excellent essay on the *Mahābhārata* to the *Westminster Review* in April 1868; and among his papers will be found a copy of the great Eastern epic collated with the best European MSS. His library is, we are glad to hear, to be kept together.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 45.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The next number will be published on Monday, April 15, and Advertisements should be sent in by April 10.*

## General Literature.

**Enciclopedia Dantesca.** Di Gius. Jacopo Prof. Ferrazzi. Vol. IV.: Bibliografia. Bassano: 1871.

**Bibliographia Dantes ab anno 1865 inchoata.** Edidit Julius Petzholdt. Dresdae: 1872.

THE volume now issued by Professor Ferrazzi is the conclusion of an immense labour undertaken by an estimable Italian scholar for the glory of the national demi-god. The first volume appeared in 1865, the year of the Dante Centenary, and contained a phraseology of his *Divine Comedy* and lyrics, as well as of Petrarca, and the great works of Ariosto and Tasso. Here the various passages from the several authors are arranged under appropriate headings, according to subject-matter. The second volume comprised a vast fund of miscellaneous matter, such as a chronological summary of the life of Dante, and of events more or less directly connected with it; Dante's politics, philosophy, cosmology, metaphysics, theology, &c.; his commentators and translators, and the bibliography of his works in various languages. The third volume gave numerous axiomatic or proverbial sentences, and similes, from the *Divine Comedy*, a list of the principal personages named in that poem, and various other particulars; also a considerable body of analogous details regarding Petrarca, Ariosto, and Tasso. The newly published volume iv. aims less to open up entirely fresh lines of investigation respecting Dante than to fill gaps perceptible in the previous issues, and amplify information there proffered. We find here such headings as biographical studies of Dante; poetical compositions in his honour; his religion and catholicism, and knowledge of divers kinds; an itinerary of the *Divine Comedy*; works of art relating to Dante and his poems; legends and visions with which the *Divine Comedy* has some apparent connection; Virgil according to the conceptions of the middle ages; variations and other textual studies (a very serviceable compendium); the chief editions, comments, and translations, of all Dante's works; and much other miscellaneous matter.

Allighieri has in all ages found readers and commentators with no lack of ingenuity—rather, possessed of even a morbid ingenuity in the research and solution of difficulties: they might now apply this faculty to a new problem—namely, whether there is a single matter closely or remotely connected with their poet that is not, in some way or other, touched upon by Professor Ferrazzi. In fact, the reader who has once become expert in the scheme and arrangement of the book has before him a perfect mine of information. In many instances he will find a detailed answer to any enquiry which may have suggested itself to his mind; in others, he will at least be referred to available sources whereat he may drink deeper of Dantesque lore. To take a single small example:—We have just written the poet's

VOL. III.—NO. 45.

family-name as "Allighieri." The reader may study the much mooted question of the spelling of this name, by aid of a number of authorities cited by Professor Ferrazzi. The Professor himself is in favour of "Alighieri:" the present representative of the line, I observe, Pietro Serego-Allighieri, uses the double *l*.

Here is a note of some singularly interesting documents that were brought together in the great Dante Exhibition of 1865:—

"1. Register of Matriculations in the Guild of Physicians and Druggists, wherein is found written the name of Dante Alighieri. 2. Book of Deliberations of the Councils of the Capitadini and the Hundred; where are found registered certain opinions expressed by Alighieri. 3. Book of Sentences, commonly named the 'Nail,' in which are registered the two sentences that Cante de' Gabrielli of Gubbio, podestà of Florence, pronounced against Dante on the 27th January and 10th March 1302. 4. The Minute of the 12th August 1373, whereby Giovanni Boccaccio is commissioned to read the *Divine Comedy* in public. 5. Minute of the Council of the Eighty, in the Commune of Florence, of the 8th June 1485, ratifying the demand of Messer Dante Alighieri, grandson of the divine poet, to be relieved from any exile, and allowed to return to the country, 'considering . . . that it is well to show some gratitude to the posterity of that poet who is so great a distinction to this city.' 6. The Florentine Academy to Leo X. Having heretofore petitioned him that the bones of Dante might be brought from Ravenna to Florence, they thank him for assenting, and for the favours whereby they can further promote the study of arts and letters, and especially poetry, in virtue of the public expounding of the *Divine Comedy*. Many Academicians subscribe, among whom is Buonarroti, who signs thus: 'I, Michelagnolo, sculptor, make the same petition to your Holiness, proffering myself to the divine poet, to construct his sepulchre, appropriate, and in an honourable site in this city.'"

Another document, published by Signor G. Milanese, dated 28th April 1301, deposes "Dante de Allagheriis" to see the Via di San Procolo and the Via dell' Agnolo widened and straightened, and the obstructive house of Ruta d'Allerone pulled down. A less authentic record of the poet is the drama of *Dante*, by Ignaz Kollmann, published in 1826, and said to be now extremely rare. We here find Allighieri banishing the chiefs of both factions; his wife Gemma presumptuously chafing at his moderate and patriotic policy; her brother, Corso Donati, in love with Beatrice, poisoning her father, and eventually herself, and calling the alien Valois into Florence; Beatrice, on her deathbed, signifying to Dante, now in exile, the theme of the *Divine Comedy*. There is also a humorous incident of a German newly arrived in Florence, who, being pounced upon by a Florentine "White," and summoned to join that faction, knocks his interlocutor down, taking him for a madman; a "Black," observing this, jumps to the conclusion that the German must be a "Black," and he also is felled to the earth on like cause shown. Dante then has to adjudicate upon the case of this bellicose man of peace, and dismisses him scathless.

Professor Ferrazzi has no doubt a wide and minute acquaintance with the works of Dante, and the matters of scholarship more directly relating to those works and to the poet himself. Outside of this immediate circle, however, there is a great deal requiring to be done in a work of so comprehensive and encyclopædic a character as that to which the Professor has vigorously addressed himself; and, to make the work finally complete and satisfactory, he should, I think, commit certain sub-sections to the care of sub-editors. For instance, the details of English books, &c.

are left in a sad state. An Italian scholar printing his vast aggregation of particulars in Bassano cannot be expected to get these things right: but *some one* ought to do so. A "Baronet" is not the same thing as a "Baronella" (p. 329); and I never heard of Mr. Morris Moore's being an American. The titles of English books are a thing to wonder at in many instances: perhaps the following is the worst example of all (I transcribe *literatim*): "MILTON JHONSON.—Paradise, Loft Post, in 8°. Cloth. 55 (Ball. 1863.)" This entry appears among "English Translations" of Dante, the assumption, no doubt, being that one "Jhonson Milton" has translated Dante's *Paradiso*. Need I say that no such translation exists? and that this fearfully mauled title can only represent the *Paradise Lost*, a sufficiently well-known original poem written by John Milton? Professor Ferrazzi was evidently himself embarrassed by this entry; for he adds to the title, as cited above, "Thus notified by Carpellini." Here follows another mistake; for which indeed the Professor is in no wise responsible, but which yet would not have passed muster in his pages without some word of protest, had the sub-section of fine art been separately and cautiously supervised. In the Dante Exhibition already mentioned appeared a "portrait of Messer Folco Portinari," which some daring enthusiast or excited proprietor attributed to "John van Eack [should be Eyck] of Bruges." It is of course grossly improbable that any portrait of Folco Portinari exists or ever was painted; and that an artist born and residing in Flanders should have painted it is practically beyond the pale of debate. But van Eyck, of all men in the world! when Folco died in 1289, and van Eyck was born in 1370!

To leave minutiae, however, I must heartily congratulate Professor Ferrazzi—and, as an individual student of Dante, thank him—in view of the completeness of this onerous and most creditable undertaking. A second edition should be forthcoming at no distant date: details can then be rectified, and the arrangement of the whole work systematized—in especial, incorporating the new vol. iv. according to the proper sequence of its items in vols. ii. and iii. The accomplished Professor has done his patriotic work in the best spirit, and to a truly useful result.

The second of the two Dante publications named in my heading is of a much more restricted scope. It only gives that section of Dantean bibliography which has accrued since 1865 inclusive, the year of the centenary. The vast area over which Professor Ferrazzi has had to range may be approximately suggested by noting that the poor seven years of bibliography recorded by Herr Petzholdt fill no less than 67 pages, and this although he (unlike the Italian adept) hardly ever gives anything beyond the bare words of title, and other such catalogue items. If we reckon eight books to a page (which seems rather below the mark than above), we find 536 separate works named by Herr Petzholdt in his slightly and careful brochure. Ten more pages are filled to advantage with a list of the works of art, almost entirely by German artists, collected in the Dresden Library by that eminent Dantophilist the King of Saxony—to whom, under his pseudonym of Philaethes, this pamphlet is dedicated.

W. M. ROSSETTI.

*Le Testament d'un Latin.* Par Louis Rambaud. Paris: Charpentier; London: Williams and Norgate.

MEA CULPA is not always a sincere ejaculation; men are found to cry, "miserable sinners," when no other way of glorifying themselves is at hand, and then of course they seek to startle by the enormity of their confessions.

Is M. Rambaud in earnest, or is the tone of unmixed

depression in which he speaks of the future of his race only another form of *forfanterie*? Either way, we trust there are not many like him; for to say plainly that you despair of your country is a very different thing from being severe upon her faults.

And M. Rambaud is worse than a pessimist: he is a fatalist to boot; he believes in the inherent fitness of some races and the unfitness of others for that liberty which alone (he says) can keep a people permanently alive. This fitness depends on the possession of "three talents, those of dignity, responsibility, and solidarity . . . and a talent—*une faculté—ne se donne pas*." Now some of us will demur to the assumption that the Latin race has no real sense of that "solidarity" about which its mouthpieces are so fluent; and those who have lived in France will generally admit that in "dignity"—respect for himself and for the rights of others—the humbler Frenchman is on the whole above his English or German brother. But M. Rambaud, Latin to the backbone, must start with assumed principles; and if facts interfere with his deductions—we know the proverb. For instance, to say that "France submitted so long to the empire because the principle of association cannot work among the Latin race" is to say something which requires proof; but to prove it by asserting that *trades' unions* do not flourish in Wales is to ignore a movement which has just now almost disorganized the coal-trade throughout a large part of the United Kingdom.

Still M. Rambaud is well worth reading: for "physics and politics" will always be a taking study—chiefly perhaps because of the "unknown factor" which meets us in every calculation of the causes why Frenchmen are Frenchmen, and Germans Germans. Nothing in history is stranger than the difference between the way in which the Americans went on without a hitch when their president was struck down and the servile waiting upon one man's health and temper which for years characterized what we suppose must be called French policy.

And this weakness is of old date: M. Rambaud traces it through the whole sad tale of the *parlements*, their petty revolts and easy submissions. Once, in 1356, under Marcel, the states-general seemed about to make a stand and to force the king to take a privy council into partnership with him; but (in M. Morin's words: *la France au moyen âge*) the attempt *avorta douloureusement*; Marcel was beguiled by the dauphin's promises, and the chance was lost of anticipating our constitutional arrangements. Mediaeval France was as fond as we were of representative government; whence then the rapid change on which Mr. Froude delights to expatiate, and the difference between the free sturdy Englishman and the slavish Frenchman as they are drawn by Sir John Fortescue?

"It is all race," says M. Rambaud; and his only hope is in an infusion of new blood, though he believes that "*jamais la grande vierge saxonne n'épousera les noirs petits capitaines latins*." But there have been successive infusions—one of the strongest when orthodox Franks came down to fill up the gap left by those ultra Latins the Albigenses. And France (says our author) owes all her worry and her profitless civil wars to her lack of homogeneity; she cannot go quietly to decay like a people of pure Latin race, and the Germanic element is not strong enough to bring lasting liberty out of her struggles. What an opportunity for Prince Bismarck to promote a fresh immigration!

This Latin blood, then, is answerable for everything—for the centralisation which makes provincials (as Heine said) like milestones that tell you at once how far you are from the capital; for the system which gives one soldier and one civil servant for every twelve *citoyens actifs*, and which enables M. Renan to compare France now with the empire

under Diocletian, "the equality of civil rights consoling us for the want of anything like real political freedom;" it is even answerable for the decay of population compared with "the exuberant life which is filling the world with English colonies."

The only question with M. Rambaud is, will things go on thus to the bitter end? Are these signs of death, or is it only a change passing over the nation? "In nations which have no capacity for freedom these are signs of more than change: such nations have nothing to give instead of that individuality which is the safeguard of the race, and with which modern life is always at war. They may last a long time: a tree goes on for years after it is really dead at the heart; *il n'y a rien qui vive si longtemps qu'un peuple mort*."

It is a new thing for a Frenchman to take the title "second empire" as more than a sobriquet, and to tell his countrymen that he is sadly afraid they have begun that life in death which the case of Byzantium shows may last for many centuries. France is in a sad plight; but so she has been before. Even the national morals are not lower than they were in the days of Henri III.; and as for drawing comparisons between a French lad, "*à qui manque la vie et qui épuise le peu qui lui en reste à satisfaire ses passions de vieillard*" (p. 253), and a *lourd colosse anglais* drawn after the pattern of one of *Punch's* Midland colliers, let M. Rambaud go into Touraine and Anjou, instead of taking his types from the Paris streets, and he will find that man for man the peasantry there are finer fellows than those in many English counties.

Fatalism works in two ways: it may lead to desperation and that "wretchlessness" of which the Church article speaks; it may foster that energy which has made the Scotch successful all the world over. If you believe yourself predestined to great things, your faith will most likely be helpful; but if you are convinced that you belong to a rotting race, there is not much hope for you. Whatever you set about, you will think that you start heavily handicapped, and your running will be weak in consequence.

If Frenchmen come to feel as M. Rambaud does, what are they to do? Creative power in art (most manifest, as he truly says, in times of upheaval) he denies them; even taste they will lose, if the wretched works which have been set up as models under the late empire do not show that they have already lost it. Their art and their literature are condemned to be Hindoo or even Chinese.

This is a bad state for the home of ideas to fall into—a strange contrast to that glorious future which the ex-emperor foresaw for the Latin races when he supported the Jecker claims. Even we, with our "Celtic element," and America with its strong Irish leaven, had better beware—unless indeed Mr. Huxley is right, and Celt and Saxon are at bottom the same; in which case we may say that it is the Basque and not the Gaul which makes France too "Latin" in its characteristics.

With all his assumptions M. Rambaud is suggestive and (as we said) worth reading: his quotations, above all, are valuable; it is well to be reminded (from M. Laboulaye) that the Spanish republics find the constitution of the United States a shirt of Nessus which destroys them; and this from Châteaubriand, "on affirme que dans cette civilisation à naître l'espèce s'agrandira; n'est-il pas à craindre que l'individu ne diminue?" is an unexpected parallel to a well-known line of Mr. Tennyson.

H. S. FAGAN.

#### LITERARY NOTES.

In the *Révue des deux Mondes* (March 15) M. Renan begins to summarise the researches of MM. Boutaric and Natalis de

Wailly on another of Philip the Fair's ministers, Guillaume de Nogaret. This first part includes the affair of Anagni and the election of Benedict XI. M. Renan calls attention to the astuteness with which Nogaret makes his report of his negotiations with Boniface in 1300 justify or extenuate the later act of violence; and he points out that Philip's victory over the papacy depended not so much on the daring *coup de main*, which failed, but on the death of Boniface and the pacific intentions of Benedict, which left it apparently unresented and certainly unpunished.

The *Gazzetta ufficiale* (March 18) abridges from an unpublished MS. in the Casanatani library some letters to Cardinal Rinaldo da Este, written by G. B. Niccolosi, a Sicilian, giving a description of his journey from Milan to Baden in 1645. His observations and his jokes are strangely like those of tourists of the present day, though the latter are not always intelligible. He proposes that *Via Mala* should be called *Via Pessima*; he describes the inhabitants of the Grisons as all "playing the Cato, the Fabius, the Marcellus in slippers;" and by mentioning that the ruined castles on inaccessible heights above the Rhine were said to have been erected by "tyrants of the country" in the time of "the ancient Romans," he gives a curious measure of the extent and longevity of quite untrustworthy traditions; for Italian *vetturini* of the present day are in the habit of giving just the same account of local strongholds, confusing most probably a real memory of small mediaeval tyrants with a hearsay belief in the omnipresence of the "antichi Romani."

The *Nation* (March 7) quotes from *La Fleur des Chansons amoureuses* (Rouen, 1600?) a poem "which is either the original or the translation" of the pretty Elizabethan song, beginning "While that the sun with his beams hot," given as xli. in Mr. Palgrave's *Golden Treasury*. There are two verses more in the French than the English, but the refrain is one line instead of three.

The publisher of the University of Glasgow, Mr. Maclehose, has forwarded us a poem entitled *Olrig Grange*, which seems worth noticing because it is a work of very considerable and at the same time most uncertain promise. The characters remind us of Mr. Oliphant's *Piccadilly*. The story is worked out rather too much in the manner of Mr. Browning, but it is conceived with quite uncommon power of kindly discrimination and insight; and this is the promise; but it is at bottom a poor hackneyed old story, and this the writer does not seem to see. The situation of Lockley Hall supplies a text for admirable declamation, but when it comes to be developed, the hero is always a poor creature wearing himself out in a vulgar struggle with vulgarity. The pious self-pity of the worldly mother and the despair of the worldly daughter, which is less unreal for being theatrical, are really brilliantly put. But the light by which the author sees and shows them, though it is kindled from within, will only go on shining if it is shone upon; it will soon burn itself out if only used to illuminate brilliant "glimpses of the obvious." The author, if he works out the satirical side of his book, may become a popular novelist; if he works out the ideal side, or the side he means to be ideal, he may inherit the mantle of A. K. H. B.; if he rises altogether above *Olrig Grange*, he has force enough to be a real poet.

The mysterious story of Kaspar Hauser, the wild boy, is nearly forgotten in England; but a book lately published by Dr. Meyer to prove that his whole story was a fraudulent invention has awakened a lively controversy in the newspapers, in which the surviving partisans of Hauser or their descendants endeavour—not to explain the mystery—but to show that there really was a mystery to explain. Unfortunately all the contemporary investigations into the case were conducted with incredible carelessness and disregard of the rules of evidence; and though Professor Daumer promises fresh facts in favour of the sincerity of Lord Stanhope's *protégé*, his letter on the subject in the *Allg. Zeit.* (March 14) does not lead us to expect that they will be very important or conclusive.

We have to announce the death at Cracow of Count Prezdziecki, a considerable name in the history, archaeology, and literature of Poland. Born in 1814 in Podolia, he began life in the Russian diplomatic service. As a youth he had travelled throughout Europe, and in 1845 published a couple of volumes of travels in Sweden, and a series of historical and picturesque sketches in Podolia, Volhynia, and Ukraine. A large fortune enabled him to play Mæcenæas to Polish history: and Theiner's *Monumenta Poloniae et Lithuaniae*, the last three volumes of Michael Wisniewski's *History of Polish Literature*, as well as the great edition of Długosz's works now in course of publication at Cracow, were supported by his liberality. Among his own books may be named—*Specimens of Mediaeval Art in Poland*, the *Domestic Life of Hedwiga and Jagellon*, the *Queens of the Jagellon Family*, &c. His death is a great loss.

The controversy as to the nationality of Copernicus has been lately resumed in an anonymous pamphlet published at Breslau. The arguments in support of the Polish claim to him are that he was born in a Polish town (Thorn) of a Cracow family, that his name and his best friends were Polish, and that, if he had been a German, he would not have studied as he did at the University of Cracow. Unfortunately for the discussion, Copernicus has left nothing behind him in any other language but Latin. An excellent edition of his works, with Polish translation by Bartoszewicz, has lately been published at Warsaw.

### Art and Archaeology.

**Grimm's Select Essays.** [*Zehn ausgewählte Essays zur Einführung in das Studium der modernen Kunst.* Von Hermann Grimm.] Berlin: Dümmler's Verlag, 1871.

THE student of classic art finds himself in a deserted ruin, where out of mouldering fragments he strives to reconstruct a whole, to divine the life of the dead, to image forth their work, their age, and the character and succession of their different periods of production. But, if we turn to modern work, we are embarrassed by the very abundance of our materials. Letters, documents, biographies, are at hand, with which to piece out, complete, and interpret, the faults, the doubts, the problems suggested by the subject. Instead of resting on the shifting sands of hypothesis, and the uncertain bases of subjective impressions, we are able to make deductions from facts. Yet, after all, our mass of materials is but a mass of materials which no one has yet attempted to bring into shape and order. Every day the want of anything like systematic arrangement is more and more painfully felt. In the present volume of essays Dr. Grimm contributes something towards the commencement of the herculean task, rather, indeed, by the spirit in which he writes than by actual fact of accomplishment.

Under the somewhat inappropriate title of "an introduction the study of modern art" we have what is strictly speaking an introduction to the study of German work of the present day. We pass from Raphael and Michel Angelo to Carlo Saraceni, who becomes the text for an essay on the decadence; Albrecht Dürer typifies the great movement of the sixteenth century in Germany; a chapter on Goethe's relations to the arts seizes the critical moment when German art became again an expression of national life; Carstens brings us to Cornelius and Schinkel; and the closing paper discusses the fresh impetus given in a wholly new direction by the national art museums which are now springing up over the whole of Europe. These essays are really completely independent of each other, and were produced at very different periods of time. They are now put before us without any attempt having been made to give them a connected literary form, and it is only because of the tone common to them all that we are enabled to treat them as a

whole. In the opening paper, an address to the Venus of Milo, the key-note of the book is struck—

"Bewunderung und Staunen erweckt sie, die Phantasie trägt uns mit Macht zurück zu ihren Zeiten, aber fremd bleibt sie uns dennoch, und während wir im Anschauen verloren sind, sagt uns eine leise Stimme, es sei für uns kein Herz mehr in dieser Schönheit."

The product of a past age may say much to us, but it cannot have the full significance which attached to it in its own place and day. There is no such thing as cosmopolitan art. The charm of novelty is a legitimate charm. The age in which we live is the best for us. It is impossible for us to thrill with the emotions which quickened the pulse of past life. Therefore the art of our own time has power to move us when the work of the Past, however great, leaves us cold in the midst of our admiration.

"Orest und Oedipus, Iphigenie und Antigone, was haben sie gemein mit meinem Herzen?"

The crowning beauty of that which is handed down to us from the Past is fled. The surroundings are gone, the people are no more who girt about the master and his work—that work in which he shadowed forth his secret, which was one and the same as the secret of his people and his day. So, for us, to-day, the day which is ours, is the best, and its art, however bad, better to us than any which has been before.

It will be evident from these passages that Dr. Grimm approaches the subject of art from the literary point of view. And this point of view, however full of value and interest, gives us only one side of the question, the side which is alone intelligible to the artistically uneducated mind. Form and content, the constituent elements of a work of art actually inseparable, are separable in idea. To the man trained in literature as to the public, the chief element of interest is content, a quantity ever varying in relation to the age. To the artist, the predominant interest is form. The brotherhood of art is no empty word; each artist is a student of the same science, the science which gives form. The learner of to-day can stand in spirit without effort by the teacher of the Past. But he who enters on the study of art through the gate of literature has ever to create for himself by a mental process the conditions which complete the work under observation, before he can see its import. As a consequence he stands admiring, moved rather by cold and conscious pressure than because he has given himself over unreservedly to his impressions. The skilled musician, on the contrary, reads a sonata of Mozart's unchecked by reflections on the conditions of life in Austria when Mozart wrote; and the Venus of Milo is to the artists of England as she was to the sculptors of Greece. And even when we speak strictly of the content—the "geistige Inhalt"—we must remember that works of the finest art develop generally some simple strain of passion, eternal in human nature, which, as such, speaks straight to the heart of all time in spite of unaccustomed mode of manifestation. It is only after having made these limitations that we can give a qualified assent to Dr. Grimm's proposition—"the art of the day is the best for the day." It is, indeed, the outcome of the day's striving, fashioned of the thoughts common to us all. Doubtless to the German, Potsdam is more lovely than the Parthenon; the frescoes of the Ludwigskirche surpass the hand of Raphael in the Vatican; and Frederick, brave in the Berlin square, breathes a holier inspiration than the god-born sorrow of Niobe.

Yet, out of what may seem to some onesidedness and defect, comes the special point and value of these essays. Dr. Grimm has confined himself to criticism and interpretation in that province in which he is a master. He does.

not pretend to offer us here speculative theories, or aesthetic criticism for which he has no gift, but seizes on the relation of the artist to the thought and life of his time. And he has given us in every instance a suggestive and vivid picture, without affectation in thought or manner. In the paper on Michel Angelo and Raphael he has indicated the relative position of both by happy touches, which discriminate them not only as artists but as men. The grand figure of Michel Angelo is treated with a sympathy rare even in those ready to do him just honour, and the stress which is laid on the depths of tenderness and sensitiveness in his nature shows considerable power of insight into character. Wherever there is any falling short in judgment, it would seem to arise rather out of the influences of early association and training than from any defect of natural power. It appears, indeed, in the highest degree improbable that one who so warmly enjoys modern German work, and who can speak of the Cornelius movement in terms of such enthusiastic admiration, should be able to bring to his task full appreciation of the qualities which are essential to a genuine work of art. If, however, certain signs are here noted which the English critic, in common with the non-German world, holds to be marks of imperfect or improperly trained perception, it is with much reserve of judgment, and with a strong desire to bring into full relief the valuable qualities of Dr. Grimm's book. No one who reads it will fail to see its freedom from pretension and phrase-making, or to be attracted by the way in which he sketches the leading lines of each age, the power with which he individualises each man, connects him with his time, and reads him in his work.

E. F. S. PATTISON.

## ART NOTES.

A letter dated Berlin, end of February 1872, and signed Phil. Silvanus, appears in the present number of the *Zeitschrift für bildende Kunst*. It gives interesting particulars as to the relations now existing between the government and those art institutions which are under governmental control. Both the Academy of Arts and the Royal Museums have suffered severely under the Mühlner régime, and are hoping anxiously for a more liberal policy from his successor, Dr. Falk. Many posts have been allowed to remain vacant from motives of economy; the question now is by whom are they to be filled, and what is to be the programme of the future. Of old, there was a General-Director, to whom the directors of the separate galleries and cabinets were subordinate; the chief was always considered to fill a court office, and it was necessary that he should be *hof-fähig*. Since the voluntary resignation of Herr von Olfers, who obtained this appointment through the favour of the Queen Dowager, this post has remained unoccupied. It is now nominally held by the Crown Prince, Herr von Usedom being appointed at least for six months as his *Adlatus*. According to all report, Herr von Usedom is the right man for the place. But, it is asked, is the existence of such a place desirable? The General-Director has the supervision of a number of collections and galleries, which represent the most various departments of the arts. No man alive can possess in each special knowledge which would warrant him in trusting to his own judgment. He must therefore often (whoever he may be) rely on his subordinates if he wish to avoid making serious mistakes. On the other hand, it is urged with much show of reason that in the interests of the institutions themselves it is highly desirable that they should have a zealous and active representative who can make their wants known to government, and enforce the attentive consideration of their pecuniary and other needs.

The Burlington Club intend to hold an exhibition of pictures and drawings by Holbein in the house of the club, and to open the same at the end of April next. This exhibition will include pictures and drawings from Windsor Castle and other royal

palaces. At present there is a fine collection of drawings by Claude on view, together with Limoges enamels lent by Baron Rothschild and another member of the club.

The Academy at Düsseldorf has been destroyed by fire. The picture gallery and library have escaped.

Mr. George Burnett's choice collection of modern pictures, water-colour drawings, and a few pictures by old masters, was disposed of on Saturday, March 16, by Messrs. Christie and Manson. The drawing by T. M. W. Turner, R.A., of St. Agnes' Hill, engraved in the "England and Wales" series, fetched 350 guineas; his "Kelso Bridge," an exquisite drawing in miniature, 141 guineas; "Brienne," another drawing in miniature, engraved as an illustration to Sir Walter Scott's works, 150 guineas; "Whitehaven and a View on the Medway," a sketch in oils, 150 guineas. "The Spring of Life," by Mr. Frederick Walker, 101 guineas. Two fine paintings by J. Constable, R.A., "A View on the Stour, Canterbury," 475 guineas, and a cabinet picture, "The Opening of Waterloo Bridge," 315 guineas. The "Frank Encampment," by J. F. Lewis, R.A., 420 guineas. Three cabinet examples of Edouard Frère, 1021 guineas. "Dolores," by John Phillip, R.A., 900 guineas. The prices now given for works of recognised merit, both in England and abroad, have reached a point never before touched. On the Friday preceding the sale of Mr. Burnett's collection, a single plaque of Wedgwood ware, the "Nine Muses," by Flaxman, was sold for 100*l*.

Sir John Gilbert, who has just received the honour of knighthood on succeeding to the presidency of the Old Society of Painters in Water Colours, was born at Blackheath, Kent, in 1817. Although he is principally known to the public by his popular illustrations of popular works, he has throughout his career constantly painted both in oil and water colour, and exhibited at the Royal Academy, at the British Institution, and at the Gallery of British Artists. In 1852 he was elected an associate of the Old Water Colour Society, and he became a full member in the following year. He is now the president of the society, and has recently been elected an associate of the Royal Academy.

We hear that the paintings offered for exhibition in the Albert Hall, though equalling in number those sent in last year, have considerably deteriorated in quality.

The sale of the Pereire collection ended on the 9th of March. Examples of the French school in the eighteenth century came to the hammer on the 7th. A "Little Girl," by Greuze, went for 32,500 fr.; and Pater's "Plaisirs champêtres" fetched 19,200 fr. On the 8th and 9th came the Flemish and Dutch pictures. A "Female Portrait," Franz Hals, 21,000 fr.; Rembrandt's portrait of Justus Lipsius, 38,500 fr.; Rubens' "Apollo and Midas," 40,000 fr.; Jacob Ruysdael's "Le Château," 47,000 fr. The sum total realised by the sale was 1,785,586 fr.

M. Champfleury has been named successor to M. Riocreux, as head of the collections of the national manufactory of Sèvres. The death of M. Riocreux was announced in our last number.

The administration of the Louvre has just purchased the crayon portrait of Ingres which was engraved by Galamatta.

A superb specimen of eighteenth-century art was brought to the hammer on the 20th March, at the Hôtel Drouot. Amongst about a hundred fine Italian, French, and German medals, occurred the magnificent medallions of Louis XVI. and Marie Antoinette, executed in 1785 in hammered and chiselled silver by Lortion, the king's goldsmith. The copper gilt frame which surrounds them is also a gem in its way; it was the work of Gouthière, and is elaborately ornamented with the royal arms encircled by branches of lilies.

The rumour runs in Paris that Mlle. Rosa Bonheur is to be made a member of the Academy of Fine Arts. It is also said that the Royal Academy of London has in contemplation the admission amongst its number of the most distinguished English women artists. As respects the French Academy, it would be no innovation, but the revival of a custom which prevailed from its foundation up to the revolution of '89. Me. Vigée Lebrun was the last woman academician.

Under the title "Chronologische Lijst der Ammans van Antwerpen," an extract has been reprinted from the *Annals of the Belgian Archaeological Academy*, which will be of interest to students of the school of Bruges. It is a notice by the late M. Torfs, with annotations by M. le Chevalier Léon de Burbure, on Jean van Eyck, commonly called van Eycke, Amman d'Anvers, in 1431-1437; and Jean van Eyck, the well-known painter, who are possibly one and the same person. The painter was, as is commonly known, *valet de chambre* to Philippe le Bon, and the Amman was probably the Jean van Eyck mentioned as *huissier* to the same prince. But it is worthy of remark that these two men whose names are precisely similar lived at the same time, at the same court, were both favourites of the Duke of Burgundy, and that the Amman is never mentioned after the death of the painter.

The direction of the Dresden Gallery bought, not long ago, as a Holbein, a painting in monochrome of the "Death of Virginia," signed with the monogram "HB." Herr Director J. Hübner has lately made public in the *Illustrierte Zeitung* a woodcut from the work in question. His statement that the monogram, which apparently referred to Hans Bock, disappeared in the process of cleaning incites us to wish for more minute particulars as to the process employed. It is possible to destroy even a genuine inscription.

### Music.

**The Oratorios of Carissimi.** Edited by F. Chrysander. Volume the First; containing Latin Oratorios: *Jephthæ, Judicium Salomonis, Jonas, Baltasar*. [To be continued.]

THE life of Giacomo Carissimi was the most eventful, as well as one of the longest, recorded in musical biography. Greater changes in musical practice are included between the beginning and the end of his artistic career than of any other musician. Born about the year 1580, he might have seen Palestrina; living certainly till 1670—how much longer is uncertain—he might equally have seen Lully, J. Ambros Bach (the father of Johann Sebastian), and Purcell. He probably knew Stradella and Corelli, and he is said to have given some instructions to Alessandro Scarlatti; men, one and all, whose compositions differ from those of Palestrina as widely as the "perfected" Gothic of the fourteenth century differs from the Romane of the tenth, or—a closer analogy—as the English of Dryden from that of Chaucer. To attribute to Carissimi, as has sometimes been done, or to any single composer, the invention of what is now understood by "expression" in music is absurd. The works of his predecessors, "the old masters," abound in expression, "although," as Dr. Boyce has well put it, "not so particularly marked" as in those of the more modern. But to Carissimi may be fairly granted the merit of having, more than any other musician, contributed to the perfecting of modern tonality, without which this same "expression," so characteristic of modern music, would certainly have been unattainable. The works of this great musician, who lived nearly a century, and who would seem to have allowed no day to pass without a "bar," have, for the most part, remained hitherto in manuscript. Collections of them are to be met with in many libraries public and private; in the Bibliothèque Nationale, of Paris; in Christ Church, Oxford; even in the British Museum, so distinguished for

its deficiencies in music and musical literature; and in the collection made by the late Abbé Santini of Rome, now, I believe, dispersed—a collection, of inestimable value, which the trustees of the British Museum might have purchased a few years since for a few hundred pounds.

Among the works of Carissimi which have attained the greatest reputation—have been most frequently referred to, and from which extracts have been most frequently made—are his oratorios; a class of composition to which he would seem to have been led to devote his powers both by natural inclination and through association with the disciples of San Filippo Neri—the Oratorians. The earnest, though not of necessity sombre, tone suggested by the places and occasions for which these works were required, and the scope for varied musical expression which their quasi-dramatic structure afforded, must have been congenial to a disposition and a talent like those of Carissimi—the one enquiring, tentative, adventurous, the other fortified by the possession of all the learning of the learned age at the close of which he first saw the light. Of these oratorios, the volume before us—one of a set of *Denkmäler der Tonkunst*, to others of which, in their turns, I hope to be able to call attention—contains four, no one of which has, I believe, ever before been printed entire. In one of these, I have an especial interest. A MS. copy of *Jephthæ* came into my possession a good many years since, and the study of it so excited my admiration that I determined on the first possible opportunity to give a public performance of it. This I was enabled to do in the year 1850. Besides a chorus, "Plorate Filii Israel," which Händel has transferred bodily to his oratorio *Samson*—an act which renders praise of it superfluous—it contains others, one depicting the flight of the Ammonites, the other the joy of the Israelites after victory, which, though musically less interesting, are scenically much more so. But the glory and wonder of the work, without any reference to its date, are the recitatives and *arie parlanti*, which for "spanning" of "words with just note and accent" have never, and even for pure musical charm have seldom, been exceeded by the productions in the same kind of the greatest modern masters, favoured as they have been by more than two centuries of subsequent experiment. The reader who may suspect this praise to be extravagant has but to turn to the first scene between Jephthæ and his daughter after his return from victory (pp. 17-20), or to the lament of the daughter, "Plorate, Colles!" which immediately follows, with its wailing echoes, and judge for himself.

The oratorio following *Jephthæ* in the present volume, *Judicium Salomonis*, is attributed by M. Fétis—he does not say why, or on what authority—to Cesti, one of the most distinguished of Carissimi's many distinguished pupils. From internal evidence I should certainly be inclined to attribute it to a somewhat, though not much, later hand, which might easily have been that of Cesti. The choruses are quite after the manner of his master; so also are the recitatives, though perhaps they are not quite up to the standard of Carissimi. But the work is full of *passages*, which indicate a condition of the vocal art mechanically in advance of any which Carissimi could have known till after he had quite formed his style—an advance involving the

"Wanton heed, and giddy cunning,  
The melting voice through mazes running,"

which must have first struck the ear of Milton in his Italian travels, and which must have been novelties, even in the Land of Song, as late as the middle of the seventeenth century. The solo parts of the *Judicium Salomonis* abound in *floriture*, and the solo of the true mother after her child has been restored to her, "Congratulamini mihi, Omnes,"

presents some difficulties even for the best trained modern vocalist.

*Baltazar*, which follows it, is a more extended work than *Salomon*. Its plan, too, is altogether different, and more after the manner adopted by Carissimi's German-born but Venetian-bred younger contemporary, Heinrich Schütz. The scenes are connected together by narrative, and the choruses, besides being more numerous, as the subject demanded, are more developed, and written for a larger choir. The great composer has naturally brought all his powers of musical expression to bear on the interpretation of the handwriting on the wall. Daniel intones the words he has to interpret on the same interval—a minor third—making each successive intonation of them a tone higher than the last. Even now, when this kind of sequence has been treated in every conceivable manner, and presented with every conceivable orchestral adjunct, this passage cannot fail profoundly to move the susceptible hearer. What must have been its effect two hundred and fifty years ago, when it was, if not absolutely new, in the highest degree uncommon and unexpected!

The fourth and last oratorio in this volume, to which we are promised a sequel, is *Jonas*, unquestionably the most varied and the most beautiful of the four. The recitatives are as interesting musically as they are appropriate to the characters to whom they are assigned and the situations which have suggested them. If the work contain no single piece of part-writing as closely knit—wherein the passages seem as inevitably to grow out of one another—as the "Plorate" of *Jephthé*, the closing "Peccavimus, Domine," with its long overlapping phrases, its masculine suspensions, and its eight-part counterpoint—each part moving with the ease and freedom of an independent melody—approaches the "Plorate" very nearly; and proves that, if Carissimi was the first practitioner of a new and necessarily incomplete art, it was from choice, not necessity; and that he might have been equally the last, in point of time, of an old and complete one—*ultimus Romanorum*. In the choruses of a more dramatic character—which are for two choirs, and moreover have an independent orchestral accompaniment—Carissimi has exhibited powers of description and realisation which even a contemporary composer with a hundred models before him might envy. In one of these the terrors inspired by a storm at sea, and in another the confession of the repentant Ninevites, are depicted or expressed in accents not only true to nature, but of themselves beautiful and regular. Carissimi stands alone among musical reformers in having never forgotten that even expression may be attained at too great a sacrifice—that of the art through which it is achieved.

JOHN HULLAH.

#### NOTES ON MUSIC.

In his eighth annual concert, Mr. Walter Bache has again considerably added to his claims on our gratitude for the propagation of modern German and especially of Liszt's music in England. The programme almost exclusively consisted of compositions by this master, the *pièce de résistance*, "Les Préludes," No. 3 of the *Poèmes symphoniques*, being repeated by desire. We have spoken about this work on a former occasion (see *Academy*, vol. ii. p. 282), and will add only that the applause of the audience seemed even more enthusiastic and genuine than last year, showing how the great beauties of the composition had gained by a repeated hearing. The principal new feature of this concert was another symphony by Liszt called *Festklänge* ("Sounds of Festivity"). Although an explanatory programme like Lamartine's words to the "Préludes" was not added to this piece, every hearer of moderate imagination could easily discern the fundamental scheme, passing through all the phases

of festive delight and enjoyment from the sacred strains of a religious ceremony to the merry rhythms of a dance at a village fair. In this high imaginative faculty consists the chief merit of the work, which otherwise seems to suffer somehow from the pompous noisiness of an occasional composition. Two charming songs without words for pianoforte by Liszt (the one a musical interpretation of one of Petrarch's sonnets), and likewise the *Polonaise brillante* by Weber, arranged for pianoforte and orchestra by Liszt, Mr. Bache rendered with all the delicacy of touch and technical skill which the modern treatment of his instrument requires. The latter work was conducted by Mr. Manns; other orchestral pieces by Mr. Bache.

The most interesting feature of the first Philharmonic concert was the first appearance in England of a German violinist, Herr Burgher, of Detmold, who, together with his master, Herr Joachim, played the concerto for two violins in B Minor by Spohr. It is in pieces for his own instrument that the considerable merits of this otherwise somewhat antiquated composer show to greatest advantage, and the rendering of the concerto by two of the most accomplished artists of his own school was a rare treat to the refined musical ear. Herr Burgher played besides with great success Tartini's *Trillo del Diavolo*.

#### Theology.

Short Explanation of the Acts of the Apostles. [Kürze Erklärung der Apostelgeschichte. Von Dr. W. M. L. de Wette. Vierte Auflage, bearbeitet und stark erweitert von Lic. Th. Fr. Overbeck, a. o. Professor in Basel.] Leipzig: Hirzel.

SEVERAL parts of de Wette's commentary on the New Testament have been issued since his death in a revised form, but this is the first time that an editor has been selected from the later school of critics. The difficulty of the task undertaken by Dr. Overbeck consisted not only in the large accumulation of materials within the last twenty years, but in the necessity of accommodating the work to the very view which de Wette himself controverted. The exposition of the Acts of the Apostles is rightly described by Dr. Overbeck as "the weakest portion of de Wette's *Handbook*." The much praised brevity of the author degenerates here into a meagreness which generally leaves the reader helpless in the face of the numerous questions raised by recent criticism. De Wette was not an opponent of this criticism on principle; he was, in fact, its most useful pioneer; though the editor remarks with much justice, that "when the *Paulus* of Baur, and a little earlier the kindred work of Schneckenburger, came in his way, de Wette was no longer

of an age consistent with full receptiveness for such original works." Besides, the classical work on the Acts by Zeller, which developed and gave a more comprehensive justification to Baur's hypothesis, had not yet appeared. The editor had consequently to choose between substituting a new work of his own, and subjecting that of de Wette to a very thorough revision. He chose the latter, in accordance with the wishes of the publisher. The whole of the original commentary is preserved, but has received many additions and the necessary corrections from the editor. The only place where the fresh matter has entirely excluded the old is in the introductory sections, which are now almost entirely out of date. It cannot, however, be denied that the book has thus become rather difficult to use, and we hope the editor will take the next opportunity of making it altogether, as the larger half of it is already, the organ of his own views.

Dr. Overbeck's work is based on the researches of Baur and Zeller. It is even to some slight extent influenced by the writings of apologetic critics, for though the editor refutes their sophisms at length, he confesses that a "not inappreciable" though "not nearly the best" part of his critical opinions has been derived from the study of their works. But Dr. Overbeck has not stopped short with the results of Baur and Zeller. A number of questions, barely touched by his predecessors, have received either a solution or at least the first careful examination at his hands. It is remarkable that he should have found so much still requiring to be cleared up in the Pauline part of the book. In his theory, too, of the object of the Acts, he deviates materially from Baur and Zeller. Instead of viewing the book as an offer of peace from the Pauline to the Jewish-Christian party, he points out that it already occupies "the characteristic position of the ancient Church in general," and therefore cannot be the result of the simple opposition between the first Christian parties. Against Zeller's view in particular he objects, that it fails to solve the riddle, how the book can be on the one side so decidedly Gentile in its tendency, on the other so weak in its Paulinism (if we may be allowed the word). The view that it was designed for Jewish Christians is refuted by the *national* antagonism everywhere prominent, and forming so strong a contrast to its *dogmatic* Judaism. Under this head we are called upon to notice the prominence deliberately given to the unbelief of the Jews, the external separation of the Christians, and lastly the predominance of the Gentile-Christian element, which is constantly assumed in the Acts. The "political side" of the Acts is also discussed, that is, the endeavour of the writer to recommend Christianity in high quarters, by describing the good understanding between Paul and the Roman officials. On the other hand it is shown that the author has already given up the distinctive theology of Paul, and only clings to his universalism, without basing it on the Pauline conception of the law; that the step however was not taken as a concession to Jewish Christianity, but in consequence of Judaistic influences on Gentile Christianity, and the natural incapacity of the latter to understand the problems of the original Paulinism. The antitheses of the apostolic age have, according to Dr. Overbeck, already lost their original significance, while Gentile Christianity appears "as the legitimate fruit of the primitive apostolic Christianity, not as the original foundation of Paul breaking through the barriers of the primitive church." The latter is, in spite of his separation from his countrymen, described as equally faithful to the law with the elder apostles, and defended against the charge of having been the preacher of apostacy; but this, too, is not a deliberate concession to Jewish Christianity, but rests purely on the assumption that the legal obligation of Jewish Christians was universal in

the apostolic age, and was therefore recognised as such by Paul. On the other hand, the first mission to the Gentiles is carried back to the elder apostles, and the public appearance of Paul marks no fresh stage in the development of Christianity. Connected, according to Dr. Overbeck, with this veiling of original differences is the fact that the conflicts of Paul in the Acts are always with Jews, not Jewish Christians. Hence the book is described as the "attempt of a Gentile Christianity, itself strongly influenced by the early Christian Judaism, to explain its relation to the past, especially to its own origin and its founder Paul."

This point of view involves a material advance upon previous criticism, and one which leads of itself to an abatement of that character of interestedness which Baur and Zeller ascribed to the author. Dr. Overbeck, seems, however, not sufficiently to have considered that the parallel evolved between Peter and Paul, the inauguration of the Gentile missions ascribed to the former, and the punctual observance of the law to the latter, cannot be explained from ignorance of the apostolic age, but only from a conscious purpose. This is still more evident from another circumstance, namely, that the Pauline epistles with which the author was certainly well acquainted give an entirely different picture of the party-differences. But the existence of a conscious purpose implies that the Gentile Christianity represented in the Acts of the Apostles had still to struggle for its rights against the attacks of Judaizers, and though not amounting to a proposition of peace to the other side, the book is certainly an apology for Gentile Christianity and its founder in opposition to the attempt of Judaizers to exhibit it as a falling away from the primitive faith. This view of the book would find its complete justification if we could recognise more distinctly the record employed in the composition of the Petrine portion in particular, a record which was probably characterized by an opposition to Paul. Of course the intended apology was facilitated by the standing-point of the author, who, as Dr. Overbeck rightly shows, had no appreciation of the peculiar position of Paul, and saw in him not the apostle of the Gentiles, but, as also in Peter, an "universal apostle."

The editor has devoted particular care to the investigation of the historical sources of the Acts. In opposition to the earlier view, which regarded the speeches and letters as so many documents at the disposal of the writer, he lays stress partly on the peculiarities of style which pervade these as well as other parts of the book, and partly on the close connection between their contents and the general tendency of the work. He points out as the only historical source, for which there is any direct evidence, the narrative of a travelling companion of Paul, whom he supposes to be, not Timothy, but Luke. The passages derived from this source, in which Luke relates his own experiences, and shows that he is an eye-witness by his use of *ἡμεῖς* (the so-called *Wir-Stücke*), relate chiefly to the journeys of the apostle, and especially those by sea. But Dr. Overbeck clearly shows that this was no mere itinerary or travelling diary, but a detailed description of the apostle's missionary labours, which is distinguished from the rest of the Acts by peculiarities of style and contents, and cannot have proceeded from the writer of that book. Its intermittent use is not to be accounted for by the presence or absence of the narrator, nor by his personal relation to the events, nor yet from the plan of the book. The passages taken from it are not even inserted without alteration, but are sometimes much abridged, and sometimes have to give place to descriptions in the tone of the rest of the Acts. Their source is alluded to at three critical points (xvi. 10, xx. 5, xxvii. 1), an allusion due to the evident wish of the compiler to be himself identified

with the companion of Paul. The commencement of the narrative is lost, as well as a great part of its original contents. As to the question (probably to be answered in the affirmative) whether the first missionary journey of Paul (ch. xiii. and xiv.) fell within its sphere, Dr. Overbeck expresses himself doubtfully (p. xlv, cp. p. lix); but he has taken all the more pains to determine, from xvi. 10 onwards, the sections borrowed from this narrative. These are, with some additions and other alterations, ch. xvi. 10-17, xx. 4-xxi. 16, xxvii. 1-xxviii. 14; while in xxi. 17, &c., xxviii. 15, &c. the compiler is thought to have connected his own work with the preceding narrative, by expressions borrowed from the latter. This hypothesis, however, is arbitrary. The renewed mention of the arrival in Jerusalem in ch. xxi. 17, may be accounted for upon the supposition that the original text was only excerpted by the compiler; and the same explanation may be given of the *ἡλθομεν εἰς Ῥώμην*, repeated in xxviii. 16 from ver. 14. The hypothesis of Dr. Overbeck is refuted by the occurrence of the words *σὺν ἡμῖν*, xxi. 18, which it is too great a licence to remove from the original narrative. The sections xx. 17-38, 33-36, 43 (*βουλόμενος διασώσαι τὸν Παῖδον*), are regarded as the interpolations of the compiler; xxviii. 1-10, as an excerpt with additions by the latter. And these are not the only passages in which, according to Dr. Overbeck, the compiler is dependent on the same record. Not a few statements are borrowed from it in the account of Paul's journey in Greece (ch. xvii. and xviii.), though these are thoroughly worked up into an independent narrative. Of course many points of detail may be viewed differently. Dr. Overbeck, for instance, regards xxi. 10-14 as a later addition, partly on the ground of its close affinity to the spirit of the narrative, partly of the "indistinctness of the chronology." Yet the latter may be sufficiently accounted for, if we suppose the compiler in vv. 9 and 10 to be only excerpting a more detailed narrative, while the former is a proof, not that the notice of Agabus is a fiction, but only that the compiler selected and reproduced this scene from the original record. The only new feature is in xxi. 13; and by the removal of this, v. 14 appears in a closer connection with v. 12. It may be added that the same reasons which have induced Zeller and Overbeck to mark xxvii. 21-26, 33-36, as interpolations of the compiler, also apply to verse 31. Be this as it may, it is at any rate one of the editor's distinctive characteristics that he has investigated the relation of the record we have spoken of to the Acts of the Apostles in a more thorough manner than his predecessors, and has conclusively proved that they are by different authors. The only other parts which, in Dr. Overbeck's opinion, are probably derived from a written source (though the precise nature of this is uncertain), are the narratives relating to Peter, and the section viii. 9-24. These, too (as in the narratives of Pentecost, of Cornelius, and Simon Magus), have been largely modified by the compiler. The date of the composition is placed in the times of Trajan or Hadrian; at least the editor wishes "to keep open" the second and third decades of the second century; and the place selected for it is not Rome, but Ephesus.

The most material improvements in the commentary are to be found in the portion relative to the speeches. The theory of their entire or partial authenticity is subjected to a searching examination, and their connection both as a whole and in each of their parts with the peculiar plan of the book distinctly exhibited. See especially the analyses of Paul's speeches at Athens and Miletus, and his three speeches on his trial, together with the entire section in which the latter are imbedded: a masterly analysis, which supplements and develops the critical theory of the book in several essential points. We find also a new view, differing

from Baur's, of the speech of Stephen, and of the apostolic decree. According to Dr. Overbeck, Stephen was not really a precursor of Paul, and the apostolic decree was not a compromise offered to the contemporaries of the writer, but an attempt to account for the precepts relating to proselytes still enforced in the Gentile Christian circles, on the one hand, and for the legal strictness ascribed to Paul on the other. Dr. Overbeck, however, opposes the view that these precepts were observed in the Pauline churches, though this view can, at the most, only apply to the purely Gentile Christian churches afterwards founded by Paul (and to these only during the apostle's life), but certainly not to that of Antioch, which has to be considered first in a criticism of the narrative in ch. xv.

In particular points of historical criticism Dr. Overbeck sometimes goes beyond even Baur and Zeller. Thus, he regards the episode of the Hellenists (vi. 1-13, viii. 1-4, xi. 19-30), at least in its present form, as an unhistorical "construction to account for Gentile Christianity;" the Hellenists were to prepare the way for Paul, and yet were not to be entirely severed from the primitive church. He forgets however that according to the Acts it was rather Peter who inaugurated the Gentile mission, and that any other preparation for the Pauline Gospel was thus rendered unnecessary. The compiler therefore can scarcely have invented the Hellenists, but merely availed himself of an earlier notice. The circumstance, adduced by Dr. Overbeck, that the Hellenists first of all act independently, and then appear dependent on Jerusalem, only proves that the latter feature was added by the compiler. The self-consciousness of Paul with respect to his mission by no means proves that he was the first in the field. The novelty of his gospel consisted, not in the admission of Gentiles, but in the religious equality of Gentiles and Jews in the church of the Messiah. But the exhibition of this as the fundamental principle of the Gentile mission requires us to assume that the mission itself was of earlier origin, not to mention the fact, that the elder apostles were not opposed to Gentile conversions in themselves, but only to the significance which Paul attached to them, and the consequences which he deduced. Even the conversion of Cornelius may be historical, though placed in an altogether unhistorical light, and probably in too early a period. If we consider further that Paul only came into conflict with Jewish Christianity fourteen years after his first appearance as an apostle to the Gentiles, and very soon afterwards separated from his companions, we shall arrive at the conclusion that he showed his originality, not in the Gentile mission as such, but in his distinctive gospel of faith in the cross of Christ, the ultimate consequences of which however he can only have developed gradually.

On the other hand, Dr. Overbeck has been the first to explain clearly the Ephesian period, and the significance of the so-called disciples of John. By means of a striking parallel between xviii. 24-xix. 7, and viii. 14-17, he shows that these disciples, who have only received "John's baptism," are no adherents of his, but actual Christians, who, like the Samaritans baptized by Philip, have received the baptism of water, but not that of the Spirit, and were to be first endowed with the *πνεῦμα ἁγίον* by Paul. The reply in xix. 2, is of course put into the mouth of these Ephesians by anticipation, with reference to the following narrative. The episode of Apollos, however, who, when in Ephesus, preaches only to the Jews, and knows nothing of the baptism of the Spirit, until he is instructed by Paul's companions, is, as the editor shows, closely connected with the narrative which follows, and is designed as an evidence of the superiority of Paul as an actual apostle to Apollos as a mere apostle's assistant. There is also a new and interesting theory re-

specting xix. 23-41, in which Dr. Overbeck sees a final description of Paul's missionary activity among the Gentiles, combining all the points of view which characterize the writer of the Acts. Here too he seems to us to go too far in denying to the narrative all foundation in fact. Whatever objections however may be made on particular points, this commentary is at any rate a scientific production of the first rank, and by far the most important among all the recent works on the New Testament literature which have appeared in Germany.

### Contents of the Journals and Notes.

**Theolog. Literaturblatt** (Bonn; Rom. Cath.), Feb. 26.—Dietzsch's *Adam und Christus*, rev. by Maier.—Lucht's *Die letzten Kapitel des Römerbriefs*, by Langen.—Allies' *Origin of Christianity*, by Kraus.—March 12.—Kraus' *Kirchengeschichte*, by Funk.—Zingerle's *Chrestomathia Syriaca*, by Röhling. [The reviewer points out the importance of Syriac texts as evidences of the antiquity of Catholic rites.]

**Theolog. Tijdschrift** (Dutch, Protestant).—Prof. Jowett's translation of Plato, rev. by Prof. van der Wijck. [On the sophist question].—Contributions to the Criticism of the Synoptic Gospels [continued], by Prof. Loman.—Hugenoltz's *Christendom and Humanity*, rev. by Cramer.—Literary survey.

Dr. Keim, author of the *Geschichte Jesu*, has contributed two papers on the Arrangement of the Acts of the Apostles to the *Protestantische Kirchenzeitung* for February. He thinks the book divides naturally at ix. 31. Its object, to describe the course of Christian missions from east to west, under the conduct of Peter and Paul. The unhistorical element in it is exaggerated; even where this exists the narrative is told in good faith. Place of composition, Rome; time, A.D. 98-117.

Dr. Geiger replies to Hitzig's paper on Belshazzar and Osiris (Isa. x. 4, according to Lagarde) in *Jüdische Zeitschrift*, 1871, No. 4.

Mr. Crowfoot has completed his retranslation into Greek of the Curetonian Syriac Fragments of the Gospels. Although Dr. Cureton published an English version together with the Syriac text, it is dangerous (more so indeed than some critics are aware) to use this or any modern translation for critical purposes without some knowledge of Syriac. Hence Mr. Crowfoot's attempt. The editor candidly remarks in the preface (p. vi), "Hoc exemplar me denuo exhibuisse vix spero; sed textus, quem propter collationem Græce restitui, ejus structuram quodammodo indicabit." The most valuable portion of the second fasciculus is the attempted retranlations of the three pages of the Curetonian version recently deposited in the Berlin library, viz. John vii. 38-viii. 18; Luke xv. 22-xvi. 12; and xvii. 1-23, for the history of which see Dr. Wright's letter in the *Academy*, vol. ii. p. 468. We regret that Mr. Crowfoot has not appended some justificatory notes to his translation. The first part was reviewed by Dr. Payne Smith in *Academy*, vol. ii. p. 63.

A convenient handbook of ecclesiastical history from a Roman Catholic point of view, dedicated to Bishop Hefele, is being brought out by Dr. F. X. Kraus (published by Lintz at Trier). Commendable though inadequate reference is made to the works of Protestant critics. We are glad to be able to add that Alzog's *Handbuch der Kirchengeschichte* has reached a ninth edition.

A notable example of caution has been furnished by the Swedish ecclesiastical authorities. A commission has been sitting on the translation of the Bible for the last hundred years, without producing more than a tentative revision, which is still exposed to the criticism of scholars.

We believe we may state that M. Renan's *L'Antichrist*, the fourth part of his *Origines du Christianisme*, will appear very shortly.

### Philosophy and Physical Science.

**The Theory of Political Economy.** By W. Stanley Jevons. London and New York: Macmillan and Co.

THIS book claims to "call in question not a few of the favourite doctrines of economists." Its main purpose is to

substitute for Mill's Theory of Value the doctrine that "value depends entirely upon utility." The rate of exchange of two commodities will, when the equilibrium has been attained, be such that the utility to each individual of the last portion of the commodity which he obtains is only just equal to that of the last portion of the other commodity which at this rate he gives in exchange for it. The utility of a commodity is in part "prospective," that is, dependent on the benefit which will at a future time accrue from its possession: and this depends partly upon the difficulty that there might be in obtaining something before that time to supply its place. Though "labour is often found to determine value," it yet does so "only in an indirect manner by varying the degree of the utility of the commodity through an increase in the supply." Bearing in mind what has been said about prospective utility, it is almost startling to find that the author regards the Ricardian theory as maintaining labour to be the origin of value in a sense inconsistent with this last position. But the language of Ricardo on this point was loose with system: and that of many of his more prominent followers differs from his only in that its looseness is not systematic. By a natural reaction attempts have been made by a series of able men to found the theory of value exclusively upon the neglected truth.

Although the difference between the two sets of theories is of great importance, it is mainly a difference in form. We may, for instance, read far into the present book without finding any important proposition which is new in substance. But at length he definitely commits himself: at the end of his Theory of Exchange we read—

"Labour affects supply, and supply affects the degree of utility which governs value, or the ratio of exchange. But it is easy to go too far in considering labour as the regulator of value; it is equally to be remembered that labour is itself of unequal value . . . . I hold labour to be essentially variable, so that its value must be determined by the value of the produce, not the value of the produce by that of the labour."

The confusion here implied is not merely one of words. He returns again in his concluding remarks to his attack upon the ordinary theory of the variation of wages in different employments, and says "the wages of a working man are ultimately coincident with what he produces after the deduction of rent, taxes, and the interest of capital." He does not see that, since rent, taxes, &c. are not paid in kind, we must have before us a complete theory of value in order that we may perform this subtraction. He does not speak of the amount of the wages, and the exchange value of the products as varying elements, the variations of each of which affect those of the other. He considers that value is determined absolutely and independently, and that wages are determined afterwards. He goes on:—

"I think that in the equation,

Produce = profit + wages,

the quantity of produce is essentially variable, and that profit is the part to be first determined. If we resolve profit into wages of superintendence; insurance against risk, and interest, the first part is really wages; itself; the second equalises the result in different employments; and the interest is, I believe, determined as stated in the last chapter."

The attempts, here referred to, to give an account of interest independent of any theory of wages or value, is bold and subtle. The reasoning is mathematical; but the argument may be expressed by the following example. Suppose that A and B employ the same capital in producing hats by different processes. If A's process occupies a week longer than B's, the number of hats he obtains in excess of the number obtained by B must be the interest for a week on the latter number. Thus the rate of interest is expressed as the ratio of two numbers without the aid of any theory of value: expressed, but not determined; yet in the passage quoted it is spoken of as determined.

ductiveness of slow and rapid processes of manufacture is but one of the determining causes of the rate of interest: if any other cause made this fall, B's process would be abandoned. The rate of interest affects the duration of the remunerative processes of manufacture no less than it is affected by it. Just as the motion of every body in the solar system affects and is affected by the motion of every other, so it is with the elements of the problem of political economy. It is right and necessary to break up the problem; to neglect for the time the influence of some elements; to investigate the variations of any one element which must, *cæteris paribus*, accompany certain assumed variations in one or more others. Such investigations give results which, even as they stand, are roughly applicable to certain special cases. But this does not justify us in speaking, in general, of one element as determined by another; as, for instance, of value as determined by cost of production, or of wages as determined by value. It is difficult to remember a prominent Ricardian writer who has not attained brevity at the expense of accuracy by employing the former of these expressions. Professor Jevons' use of the latter of them will have done good service if it have called attention to the danger of such parsimony.

The main value of the book, however, does not lie in its more prominent theories, but in its original treatment of a number of minor points, its suggestive remarks and careful analyses. We continually meet with old friends in new dresses; the treatment is occasionally cumbrous, but the style is always vigorous, and there are few books on the subject which are less open to the charge of being tedious. Thus it is a familiar truth that the total utility of any commodity is not proportional to "its final degree of utility," *i.e.* the utility of that portion of it which we are only just induced to part with, or to put ourselves to the trouble of procuring, as the case may be. But Professor Jevons has made this the leading idea of the costume in which he has displayed a large number of economic facts. In estimating, for instance, the benefit of foreign trade, we must pay attention to the total utility of what we obtain by it, as much as to its final utility, which alone is indicated by the rate of exchange. His attack on Mill on this point is worth reading, though it is in parts open to criticism; and though while Mill pleads the difficulty of the subject in excuse of his neglect of the total utility of international trade, Jevons does not overcome the difficulty. Again, the whole advantage of capital to industry—its total utility—cannot be measured by the rate of interest, which corresponds only to its final degree of utility. Again, the final degree of utility to a labourer of his wages diminishes as their amount increases, while the final degree of pain resulting from the labour, at all events after a certain time, increases as the amount becomes greater: consequently, the artisan as soon as his real wages have ceased to be barely sufficient for his support, strikes for shorter times, rather than for the further increase in wages.

Among his more interesting incidental discussions are those on the difficulties Thornton has found in the theory of value, and on the economy of muscular effort. He contributes to the definition of the terms "market," "labour," "capital," "circulating capital," but he does not keep sufficiently distinct the various connections in which each of them is employed. His lucidity serves to render darkness visible; to make us conscious of the absence of a specialised economic vocabulary, perhaps, on the whole, the severest penalty that the science has paid for its popularity. He supplies, indeed, one expression which, with a little more care, might be rendered a useful one. Capital which "consists of a suitable assortment of all kinds of food, clothing,

utensils, furniture, and other articles which a community requires for its ordinary sustenance," he calls "free capital," because it "can be indifferently employed in any branch or kind of industry." The term "value," indeed, he considers as hopeless, and he expresses an intention, to which he does not adhere, of avoiding its use.

"Value in exchange expresses nothing but a ratio, and the term should not be used in any other sense. To speak simply of the value of an ounce of gold is as absurd as to speak of the ratio of the number seventeen."

There does not seem to be any greater absurdity in speaking of the value of an ounce of gold, or of a cubic inch of gold, than there is in speaking of the weight of a cubic inch of gold. In each case reference is made to some unit conventionally adopted at some particular place and time. He complains that "persons are led to speak of such a non-entity as intrinsic value": but the examiner, who has asked for a definition of specific gravity, is fortunate if he has not heard of "intrinsic weight." The abuse of a term is not a sufficient cause for its rejection. We cannot afford to dispense with the phrase "the rate of wages," though Ricardo has employed it in a forced sense, which Professor Jevons himself has failed to catch.

He has done good service, moreover, in protesting against Mill's saying:—"Happily there is nothing in the laws of value which remains for the present or any future writer to clear up; the theory of the subject is complete." It is probable that Mill intended this to be interpreted in a very narrow sense; but anyhow, it is unfortunate. As Jevons says, it would be rash to make such a statement about any science. It would be very rash to make it about the law of gravitation. Mill would probably have been more correct if he had stated that, taking into account only questions which have already occurred, there is no one side of the theory of value which does not require for its completion a greater amount of scientific investigation than has, up to the present time, been applied to the whole of political economy—that there is scarcely any question which can be asked with regard to value to which a complete answer is forthcoming. Take, for instance, a question which Professor Jevons has made prominent—What is the influence which a rise in price of hats, owing to an increased demand, has on the wages of hat-makers? Of course one element to be considered is the facilities which exist for introducing new workmen into the trade. How far, then, is this dependent on the number of parents occupied in this and other employments who have been able to give their sons an education sufficiently good to fit them to become hat-makers, but not a much better one. What is the relation between the cost of production of an average skilled labourer and his remuneration? This is but one question out of many. We know, perhaps, in what direction to look for the answers: but the point is that they are not yet formulated. And who can tell what difficulties will have to be overcome before they are formulated?

Professor Jevons has expressed almost all of his reasonings in the English language, but he has also expressed almost all of them in the mathematical. He argues at great length and with much force the applicability of mathematical method to political economy:—

"If there be any science which determines merely whether a thing be, or be not—whether an event will happen, or will not happen—it must be a purely logical science; but if the thing may be greater or less, or the event may happen sooner or later, nearer or further, then quantitative motions enter, and the science must be mathematical in nature, by whatever name we call it."

He insists that mathematics have been successfully employed in physical sciences of which the data are very inexact; and that innumerable possibilities of economical

statistics exist already half tabulated in the books of mercantile houses great and small. His remarks on these and some similar points are singularly good. In general, indeed, he makes but little use of mathematical methods of reasoning. And he has not even fully availed himself of the accuracy which he might have derived from the use of the language. He does not always point out what are the variables as a function of which his quantities are expressed. It is often necessary to understand independently the whole of his reasoning, in order to know whether he means his differential co-efficients to be total or partial; and in several cases he seems almost to have himself forgotten that they are total. He has expressed the fact that "the last increments in the art of exchange must be exchanged in the same ratio as the whole quantity exchanged" by the equation

$$\frac{dy}{dx} = \frac{y}{x}$$

He does not indicate the existence of any relation between the  $\Delta y$  and  $\Delta x$ , of which he considers  $dy$  and  $dx$  to be the limits, which can constitute  $\frac{dy}{dx}$  a differential co-efficient: the mathematical phrase merely confuses. Some amusement has been derived from the absurd result which is obtained by integrating the equation. But this implies a misapprehension. A point on a locus may be determined by an equation with a differential co-efficient in it. If we integrate the equation, we get not this locus, but some other intersecting it at the point to be determined. An instance of a different kind of inaccuracy for which his making use of mathematical language leaves him without excuse, occurs in his investigation of the influence on the rate of international exchange exerted by a tax on imports. He tacitly assumes that the government levies the tax in kind, and destroys it, or, at all events, consumes it in such a way as not to interfere with the demand there would otherwise have been in the country for it.

We owe several valuable suggestions to the many investigations in which skilled mathematicians, English and continental, have applied their favourite method to the treatment of economical problems. But all that has been important in their reasonings and results has, with scarcely an exception, been capable of being described in ordinary language: while the language of diagrams, or, as Professor Fleeming Jenkin calls it, of graphic representation, could have expressed them as tersely and as clearly as that of the mathematics. The latter method, moreover, is not well adapted for registering statistics until the laws of which they are instances have been at least approximately determined: and it is not intelligible to all readers. The book before us would be improved if the mathematics were omitted, but the diagrams retained.

ALFRED MARSHALL.

Samuel Clarke's Life and Doctrine. [*Samuel Clarke's Leben u. Lehre. Ein Beitrag zur Geschichte des Rationalismus in England. Von R. Zimmermann.*] (Academy Reprint.) Wien: in Comm. bei Gerold's Sohn, 1870.

DR. ZIMMERMANN'S careful study of "the one English Aprioriker," as he terms Dr. Samuel Clarke, is a noteworthy exception to the general neglect of English metaphysics—except the single development of Empiricism from Locke to Hume—which prevails among German students of the history of Philosophy. Clarke, indeed, has a closer relation to continental thought than any other English thinker from Locke to Coleridge. His philosophico-theological system was developed in conscious antagonism to Spinoza: and ten years after the publication of this had established his philosophical reputation—just when his reasoned theism

had, alas! proved to be heretical theology—he was called upon to defend against Leibnitz the metaphysical principles which he held in common with his friend and master Newton. Dr. Zimmermann has given a careful and impartial analysis of Clarke's system, and an able summary and criticism of the controversy with Leibnitz. In describing Clarke as "ebenbürtig" to his two great antagonists, he does him certainly more than justice. He is a clear and vigorous reasoner, and has a genuine confidence in the completeness of his system: but one finds in him too much of the "crassa Minerva" that runs through English metaphysics: the solid, cautious common-sense that avoids inconvenient inferences from its premises by the inartificial expedient of declining to draw them. Such a metaphysical temper, matched against the iron consistency of Spinoza, or the ever-active acumen and constructive ingenuity of Leibnitz, shows an inferiority of speculative insight for which no dialectical vigour can compensate. Clarke failed to understand the intellectual needs out of which Spinoza's system sprang: and was too uncritical to see the remarkable coincidence (up to a certain point) between that "atheist's" doctrine and his own. His "Self-existent Being," of which infinite space is a *property*, corresponds closely to Spinoza's one "substance" with its attribute extension.

And yet when we come to the real issue between the two thinkers, we find Clarke's most cardinal and characteristic conclusion—from the *contingency* in the material universe to Free-Will in its eternal and necessary cause—scarcely presented in a proper light by Dr. Zimmermann. In the first place, he complains of Clarke's inconsistency of method, in using at this point *à posteriori* argument. But Clarke has never bound himself to adhere to the "high *priori* road:" it is only his German critic who insists on regarding him as a "Vertreter des Rationalismus" in conflict with the "Sensualismus" of Locke. With Locke's system as a whole Clarke seems to have had no quarrel: he acquiesces in his refutation of innate ideas; he only objects to his suggestion of the possible materiality of the soul, and to "some materialists who approved in Mr. Locke's writings nothing but his errors."\* Dr. Zimmermann scarcely understands the naïve and confident dogmatism of the disciple of Newton, writing in the full triumph of demonstrated harmony between *à priori* reasoning and empirical observation. No doubt of the absolute correspondence of Thought (in either department) to Things ever entered his head. But, objects Dr. Zimmermann, experience does not inform us of the contingency of its objects: it does not tell us what things might or might not have been, but only what they are. This again is insisting on a separation of methods foreign to Clarke's manner of thought: it is enough for him that the object presented in experience is apprehended as contingent by an intuition as naturally certain as any other, to whatever faculty it may belong: indeed, strictly speaking, this conception of Divine Free-Will is not found in either *à priori* or *à posteriori* cognition of the universe, but in the point of union between the two. And certainly he touches here the radical weakness of Spinozism (and other forms of Rational Pantheism): the unexplained *modus transeundi* from the necessary and eternal Being to the arbitrary determinateness which we find in the world of experience. The defect of Clarke's view (apart, of course, from the general objection to his dogmatic method) is not so much that he applies to this *modus transeundi* the conception of Free-Will—no more appropriate notion having ever been

\* It is curious that on this point Dr. Zimmermann puts to the address of Hobbes an argument obviously directed against Locke (or his disciples). Cf. p. 39.

suggested—as the shallowness of his reconciliation of Divine Free-Will with the principle of universal causation on which his *a priori* reasoning proceeds. And hence his treatment of the category of “sufficient reason,” in which Leibnitz tried to transcend the distinction of Final and Efficient cause, is simply unintelligent: he cannot or will not see that the Divine preference for one of two intrinsically indifferent determinations of finite existence is a fact requiring explanation.

Nor does Clarke show himself more appreciative of that other Leibnitzian principle of the “identity of indiscernibles,” or, to put it positively, the necessary qualitative diversity of individuals. But in combating this, he gains a controversial advantage which Dr. Zimmermann seems to have overlooked: as Leibnitz certainly contradicts himself, in one place allowing, in another denying, the *conceivability* of two perfectly similar individuals. Cf. Letter iv. § 6—“Poser deux choses indiscernibles, est poser la même chose sous deux noms:” and v. 25—“Je ne dis point qu’il soit impossible absolument d’en poser, mais que c’est une chose contraire à la sagesse divine.” And in so far as Leibnitz sets against the conceivability of numerically different indiscernibles their non-existence in our experience, he is certainly open to the charge of inopportune empiricism which Dr. Zimmermann has previously made against Clarke.

As a whole, the monograph is chiefly defective in indicating Clarke’s relations to English philosophy generally. I have noticed an instance of this in the supposed antagonism to Locke: whereas in fact there is as much agreement between Locke’s proof of the existence of a God, and the more developed and precise demonstration of Clarke, as there commonly is between any two thinkers classed as of the same school.\* Again, by presenting Clarke in connection with Herbert of Cherbury, the uncritical character of his dogmatism is missed. In Clarke’s metaphysic the methodological side is kept quite in the background: there appears no explicit theory of the criteria of truth. H. SIDGWICK.

#### DISCOVERY OF AN EXTINCT GIGANTIC BIRD OF PREY IN NEW ZEALAND.

##### TO THE EDITOR OF THE ACADEMY.

SIR,—Mr. F. Fuller, while directing some excavations in a marsh on the Glenmark estate, province of Canterbury, South Island, New Zealand, by permission of G. H. Moore, Esq. (whose researches have added so greatly to the evidences of the extinct birds of New Zealand), found, among remains of *Dinornis* exhumed at a depth of five or six feet from the surface, a few smaller bones, including claw-phalanges, which Mr. Fuller recognised as belonging to a large bird of prey.

With two claw-phalanges were found a left femur, a vertebral rib with its anchylosed “epipleural appendage;” and, in a watercourse about two miles from Glenmark, a mutilated right humerus was subsequently discovered, and pronounced by Dr. Haast to be raptorial, and, as well as other and better preserved bones, most nearly resembling the corresponding bones of the New Zealand harrier (*Circus assimilis*, Jardine).

Dr. Haast, F.R.S., the accomplished state-geologist of the province of Canterbury, has communicated an instructive and interesting memoir on these remains to the *Transactions of the Philosophical Institute of Canterbury*. He refers the gigantic raptorial bird of New Zealand, which was twice the size or bulk of the great wedge-tailed eagle of

Australia (*Aquila audax*, Gould), to a genus *Harpagornis*, Haast, giving it the specific name *Moorei*, after the liberal partner of Ker-mode and Co., owners of the Glenmark property. He conjectures, on good grounds, that this huge raptorial bird preyed upon the young or feeble individuals of the genus *Dinornis*, and, with them, became extinct.

Dr. Haast deduces from this discovery an additional confirmation of his belief that the present aboriginals of New Zealand do not possess any traditions about the gigantic Moas, and writes, “that, if trustworthy traditions about the *Dinornis* had been handed down to us, the still more alarming existence of this gigantic bird of prey contemporaneous with the former would most certainly have also been recorded.”

I may remark that the individual who, in 1839, submitted to me, with other New Zealand rarities, the fragment of bone which gave the first evidence of great wingless birds in that island, stated that the natives from whom he obtained it had “a tradition that it belonged to a bird of the eagle kind which had become extinct, and to which they gave the name of ‘Movie’” (*Proceedings of the Zoological Society of London*, Nov. 12, 1839, p. 169).

I am now, of course, disposed to attach more weight to this tradition than when it rested on a fossil proved to belong to a bird which could not fly, and which was at least as large as an ostrich.

We may suppose the great raptorial species which we now know to have co-existed with the *Dinornithes* to have survived, by reason of its greater powers of escape, some time after the extinction of its principal prey; and the tradition of the great bird “of the eagle kind” may be a consequence of the knowledge of the *Harpagornis* continuing down to later generations of Maories than those who hunted down the huge herbivorous flightless birds.

RICHARD OWEN.

British Museum, March 12, 1872.

#### Scientific Notes.

##### Geology.

**Fossil Bird from the Cretaceous Formation of Kansas.**—Professor Marsh reports to the *American Journal of Science* the discovery, during his explorations in 1871, of a remarkable fossil bird in the Upper Cretaceous of Western Kansas. The remains consist of the greater portion of a well-preserved skeleton, at least five feet in height. Although that of a true bird, as is shown by the vertebrae and other parts, it widely differs from any known recent or extinct form of the class, and affords a fine example of a comprehensive type. The femur is very short, the other portions of the legs are elongated, and the metatarsal bones appear to have been separated. On his return, the Professor proposes to describe this unique fossil under the name of *Hesperornis regalis*.

**The River Courses of England and Wales.**—At the meeting of the Geological Society of London on the 7th February, Prof. Ramsay described the changes in the physical conformation of Britain during the Jurassic and Cretaceous periods, and the relations which the deposits formed during these periods bear to the Palaeozoic rocks of Wales and the northwest of England. The Miocene period of Europe was essentially a continental one, and was closed by important disturbances of strata in Central Europe, one effect of which would be to slightly tilt the secondary formations of France and Britain towards the north-west. In this way he explained the north-westerly direction of many of the rivers of France; and he surmised that at this period the rivers of the middle and south of England also took a westerly course. The westerly slope of the cretaceous strata of England was the cause of the southern flow of the Severn between the hilly land of Wales and the long slope of chalk rising towards the east. The Severn would thus establish the commencement of the escarpment of the chalk, which has since receded far eastward. The author believes that after the Severn had cut out its valley the Cretaceous and other strata were gradually tilted eastwards, causing the easterly course of the Thames and other rivers of Southern and Eastern England. In these and other cases, the sources of these rivers were originally on the chalk near its escarpment; while to its recession, followed by the formation of the oolitic escarpment, its present relation to the river-courses must be ascribed. The author also indicated the relations of the courses of the rivers of the north of England to the general dip of the strata.

**The Zoological Provinces of the Jurassic Period.**—Dr. M. Neumayr, of Vienna, divides the entire Jurassic deposits of Europe into three groups: a Mediterranean group; one comprising Central Europe; and, lastly, a Russian group. The Mediterranean group, which includes rock-deposits in Spain, the Cevennes, the Alps, Italy, the Carpathians, and the Balkan range, is wanting in many of the beds that are met with, rich in fossils, in the group of Central Europe, inclusive of

\* It is worth noticing how Locke is even led to suggest that involuntary approximation to Spinozism (by connecting Extension with Deity) which is a characteristic doctrine of Clarke’s metaphysic. Locke, in defending the Vacuum against the Cartesians, finds himself in a dilemma: “Is Space something or nothing?” He does not like to assert that it is *some thing*, and yet, “if there is nothing between two portions of matter, they must be in contact.” In this difficulty he finds relief in the conception of God “filling immensity:” so that where there is no matter there is not nothing, but God. (Cf. *Essay*, b. ii. c. xiii. §§ 16, 17, and c. xv. § 3.)

France and England; it is, on the other hand, characterized by the occurrence of vast numbers of species of *Phylloceras* and *Lytocheras*. Corals existed in great abundance in the Mediterranean group, as well as in that of Central Europe, but are not found in the Russian province. The general aspect of the different faunae of these three groups is not sufficiently dissimilar to allow us to assume that they were separated by land. That, no doubt, would have occasioned an entire difference in the animal life of those parts of the ocean thus divided as is seen to this day at Suez or Panama, or in the Kimmeridge clay of South Germany and of Northern France. The Mediterranean or most southern group abounds in forms of *Phylloceras* and *Lytocheras*; while in Central Europe alone the genera *Oppelia*, *Aspidoceras* are found, and here the reef-building corals find their northern limit. The Russian Jurassic provinces, embracing Northern Russia, Spitzbergen, and Greenland, has likewise a fauna of its own. Neumayr attributes these differences in animal life to climate, which in that period must have been somewhat warmer than the present, for the northern boundary line of corals was then about 25 degrees of latitude higher than it is now. (*Verh. der k. k. geol. Reichsanstalt*, No. 3, 1872, p. 54.)

### Physiology.

**Phosphorescence.**—Professor Pancevi, of the University of Naples, has just published a memoir on this highly interesting subject, in the fifth volume of the *Atti della Reale Accademia delle Scienze fisiche e matematiche*, 1871, under the title "Gli Organi luminosi e la Luce delle Gennatule." It consists of two parts, one anatomical, the other physiological. He notes the existence of special organs which have the power and apparently the function of producing phosphorescent light, and finds that the light is only emitted by the Polyps and the Zooids, while the phosphorescent organs, as he terms them, consist of eight "cordoni luminosi," which are attached to the outside of the stomach of the Polyps and Zooids, and are prolonged in each case as far as their mouth-papillae. These threads (cordoni) are principally composed of a tissue built up of vesicles or cells and possessing all the characters of fat; albuminoid cells are likewise met with in it. This fatty matter generates light, not only by the direct excitation of the Polyps and the Zooids themselves, but by excitation of the whole trunk of the Pennatula. In the latter case the author has made the remarkable discovery that the progress of the light developed in succession over the several parts of a polyp gave a striking indication of the direction, progress, and rapidity of the excitation applied to the Pennatula, and he has found these latter calculable, a fact of the greatest interest to physiologists. Professor Pancevi further states that the phosphorescent substance produces light, after its removal from the body of the polyp, if subjected to mechanical treatment such as friction and compression, or the action of chemical agents, electricity or heat. And this is the case when the substance is extracted, not only from the living animal, but some short time after its death. The author, in his earlier investigations of the phosphorescence of other fatty substances, considered the phenomenon due to their slow oxydation. He believes this holds good in the case of the "cordoni luminosi" of the Pennatula, and thinks it to a certain amount subject to the voluntary powers of the animal. He found similar phosphorescent substances in the epithelium of Medusae, and in Pholae he saw two distinct organs inside the mantle which are furnished with the power of becoming luminous. Some Chaetopteri, Beroe, and Pyrosoma were likewise examined, and a great similarity noticed in all these cases as regards the constitution of the phosphorescent substance. In the spectroscope the light exhibits one broad band like that given by monochromatic light, while, as is well known, the phosphorescent light of *Lamprys* and *Luciola* is polychromatic.

**Mode of Increase of the Long Bones.**—A paper on this subject appears in the last part of the *Archives de Physiologie*, by MM. Philippeaux and Vulpian. The views generally adopted in regard to the mode of growth of the long bones, both in length and diameter, have been called in question by Wolff and Volkmann in papers recently published; and MM. Philippeaux and Vulpian's researches were undertaken with the object of ascertaining whether their objections are well founded. The doctrine supported by the authority of Duhamel, Hunter, and Flourens, and generally accepted, is that the long bones increase in length by additions to the extremities in the form of new layers between the shaft or diaphysis and the articular portion or epiphysis, while they become broader by the deposition of new bone in the periosteum on the outer surface of the bone. M. Wolff, on the other hand, maintains that the growth of bone is interstitial, and that each part of the bone takes part in the enlargement. He points to the persistence, during growth, of the position and relations of the peculiar and geometrically arranged trabeculae of the cancellous texture constituting the head of the bone, which could hardly occur on Duhamel's theory. He denies Duhamel's statement that a ring surrounding the bone of a young animal comes by degrees to occupy the shaft of the bone, owing to absorption of the old bone and the superposition of new; but contends that the old bone is pressed inwards, and is certainly not absorbed. He further states that when wires are passed through both the

epiphysis and two points of the diaphysis, the distance between the two latter augments just as much as the distance between the wire passing through the epiphysis and that through the diaphysis lying nearest to it. MM. Philippeaux and Vulpian oppose M. Wolff's statements. They state that rings encircling the bone, as well as metallic lamellae, interposed between the periosteum and osseous tissue in young animals, do actually cut their way till they are free, or almost free, in the medullary cavity; and they refer to specimens made by themselves in Flourens' laboratory, and now in the Musée Dupuytren, in confirmation of their theory. As regards the separation of metallic threads drilled into the bone, they think that in Wolff's experiments the two wires passed into the shaft of the bone were too near the epiphysis to furnish any satisfactory result. Finally they give the details of a series of experiments conducted under Flourens' direction, in which madder was given to young pigs up to a certain period, when one of the litter was killed, and its bones prepared as objects of comparison with those of the rest, which were killed afterwards at stated intervals up to eighteen months. The bones of these animals, they declare, clearly demonstrate the correctness of the old doctrine, and prove irrefragably that all increase in diameter is due to fresh superiostitic deposits, whilst all increase in length is caused by the progressive ossification of the osteological elements supplied by the cartilage of conjugation between the diaphysis and the epiphysis. Moreover their experiments incidentally showed that the long bones increase in length more at one extremity (the upper or proximal) than at the other.

**Structure of the American Spongilla.**—An essay by Prof. H. James-Clark, of Lexington, Kentucky, appears in the current number of the *Monthly Microscopical Journal*. Prof. James-Clark holds that each ciliated body of a sponge is a cephalic member of a polyccephalic individual, a view widely differing from the one entertained by Haeckel and others, that Sponges are essentially compound Polypi, the afferent and efferent ostioles of the former corresponding with the mouths of the latter; while the branching canals of the Sponges are comparable with similar canals in the polypidom of Halcyonarians; and by implication the cilia-bearing cells of the interior lining-wall of the Zoophyte find their homologues in the ciliated cell-like bodies of the interior chambers of the Porifera. The sponge examined by Prof. James-Clark he names *Spongilla arachnoidea*, from its resemblance to an irregular spider-web. It is a fresh-water species, clinging to the stems of water-plants, and avoiding light. It may grow to be several inches in diameter, is of yellowish-brown colour, and has a filmy envelope or investing membrane enclosing a cytotblastomatous basis in which the monads are imbedded, and of which the outer part may be regarded as an internal investing layer. The investing membrane is composed of a diffuse blastema, containing nucleated cells which, however, have no cell-wall. The monad-cephalids, as he calls them, correspond functionally to the tentaculate heads of Polypi. They are collected into groups in the substance of the cytotblastomatous mass that differs but little in structure from the outer envelope. They consist of a roundish or oval monad chamber, lined continuously by a stratum of craspedote flagellate monads, identical in structure with those described by James-Clark himself in *Leucosolenia*, and by Carter in *Grantia compressa*. These monads consist of a body resembling an amaeoid cell, to which a collar or cylindrical tube is attached; emanating from the body, traversing the whole length of the tube, and projecting from its orifice, is a single flagellum which vibrates throughout its length, but is most active near the tip; it is non-transparent, and resembles a black thread. Two or three clear contractile vesicles are contained in the body of each monad. The systole and diastole are extremely slow, but the last thread of the systole is abrupt. Arising more or less obliquely from the monadigerous mass are numerous slender slightly curved acicular spicules, which act as props to support the outer investing membrane to which they properly belong. The specimens examined by James-Clark presented no canalicular system, and he attributes its absence to their having been too young.

### Chemistry.

**The Solubility of Silver Chloride.**—In precipitating this chloride from dilute solutions, a point is reached where the silver solution gives a precipitate with a decimal solution of silver nitrate, although a decimal solution of an alkaline chloride will likewise cause a turbidity and the separation of silver chloride. If the liquid be divided into two equal parts, and silver nitrate be added to the one and an alkaline chloride to the other, it will be observed that in the latter case the turbidity is to a considerable degree the greater. By proceeding in this manner, in proportion as silver chloride is thrown down by the successive addition of the decimal hydrochloric acid solution, the turbidity caused by a given volume of the silver liquid in one-half the solution increases, while that produced by a volume of acid decreases; at last a point can be reached where equivalent quantities of the two reagents in equal volumes of the solution produce the same turbidity. Then by cautious addition of the acid reagent an order of things the reverse of the above is observed; the solution becomes more and more turbid

by the addition of the silver solution and less and less so with the chloride, till finally the latter reagent causes no precipitate and that containing silver a strong one. This behaviour of silver chloride being of importance in its bearing on Gay-Lussac's scheme of volumetric analysis, Stas set himself the task of determining the nature of these curious changes (*Comptes rendus*, 73, 998). He finds that silver chloride can exist in four different states: 1, the gelatinous; 2, the caseous or flocculent; 3, the pulverulent; and 4, the granular, scaly, crystalline, or fused condition. The chloride of the fourth kind is insoluble at ordinary temperatures; at any rate its solubility does not reach the limit at which dissolved silver can be detected: this limit the author estimates at  $\frac{1}{1000000}$ . In boiling water its solubility is proportionally very great, decreasing with the temperature; it cannot be recognised below  $15^{\circ}$ . The variety most soluble in pure water is the caseous chloride formed by precipitating cold dilute solutions; the solubility, however, decreases as the flocks condense of themselves, or on their conversion by long agitation with water, either pure or acidulated with nitric acid, into the pulverulent form. A solution of flocculent or pulverulent chloride in pure or acidulated water will form a precipitate with a silver salt or with an alkaline chloride. The quantities of silver (as silver salt) and chlorine requisite for the precipitation of the silver chloride are accurately in the ratio of the molecular weights of the silver salt and chloride employed. The quantity of silver and, conversely, the quantity of chlorine required to precipitate a unit of silver or chlorine in the form of dissolved flocculent or pulverulent silver chloride are in the ratio of 3:1. The presence of salts resulting from the decomposition does not effect the solubility of the silver chloride in pure or acidulated water. The precipitation of flocculent or pulverulent silver chloride from its solution in pure or acidulated water is due to its being insoluble in liquids having in solution an amount of silver or chlorine which is three times that present in the dissolved silver chloride itself. Saturated solutions of granular silver chloride are likewise precipitated by alkaline chlorides and silver salts, the precipitation of a unit of silver or of chlorine as silver chloride in this case also requiring three units of chlorine or of silver; the separation of the dissolved granular chloride, however, is never complete, no matter how great an amount of silver as silver salt or chlorine as alkaline chloride be added for the purpose. From saturated solutions about six-tenths of the chloride can be separated.

**The Action of Phosphorus Perochloride on Nitronaphthalin.**—In several attempts made by Oppenheim to act on nitro-derivatives of benzol and naphthalin with the chlorides and oxychloride of phosphorus, no change whatever was observed even at high temperatures. L. de Koninck and P. Marquart, in a paper in the *Bull. de l'Acad. royale des Sciences de Belgique*, 1872, No. 2, 122, record a remarkable exception. Between  $120^{\circ}$  and  $150^{\circ}$  phosphorus perchloride acts on nitronaphthalin in the following way:—

The chloronaphthalin was readily obtained from the product sufficiently pure for analysis. Phosphorus perchloride has no action on dinitronaphthalin; and nitrobenzol, after an hour's heating with the perchloride, yielded no chlorobenzol. The anomaly noticed above can be traced in other instances. Hydrogen bromide reduces nitrobenzol with the formation of bromanilines, while nitronaphthalin exchanges nitrogen for bromine. Phosphorus pentasulphide acts with violence on nitronaphthalin, but may be boiled with nitrobenzol without effecting any change.

**Eulyte and Dyslyte.**—These substances, first obtained by Baup in 1851, have been submitted to a very careful examination by H. Bassett (*Journal Chem. Soc.* February, 1872). They are obtained by oxidising with nitric acid citraconic acid, a product of the destructive distillation of citric acid. An oily substance, resulting from the action, consists of a mixture of two neutral crystalline compounds that can be separated only with extreme difficulty, and after many fractional recrystallizations. Eulyte, the more soluble body, separates from warm chloroform in large prismatic crystals with very perfect brilliant faces; they have been measured by Prof. Miller, of Cambridge. Its melting point is  $99^{\circ}5$ , and it appears to sublime unchanged. Several analyses gave numbers corresponding with the formula  $C_6H_5N_2O_7$ . Mr. Bassett's investigation of the proximate constitution of this substance has been attended with considerable difficulties and greatly delayed through want of a sufficient stock of material. Dyslyte is less soluble and less fusible, melting at  $189^{\circ}$ ; it crystallizes well from alcohol, and has the formula  $C_6H_5N_2O_8$ .

**The Distribution of Caesium in the Mineral Kingdom.**—Some new sources of this metal have recently been discovered. At the meeting of the Chemical Society on the 7th March a paper was read by Col. Yorke on the water of the hot spring of Wheal Clifford. It had been previously ascertained by the late Prof. W. A. Miller that it contains a considerable amount of lithium. The Colonel finds 1.7 parts of caesium chloride in one million parts of the water: making it ten times richer in this metal than the Dürkheim spring in which Bunsen originally discovered caesium. E. Bechi has published (*Fahrbuch für*

*Mineralogie*, 1872, No. 1, 95) the results of an examination of a beryl from Elba, in which is 0.88 per cent. of caesia. It will be remembered that the island of Elba is the locality of pollux, the mineral that contains the greatest percentage of this metal.

**Paraconine.**—H. Schiff has continued the study of the alkaloid which he succeeded in obtaining synthetically (*Ber. d. Deut. Chem. Gesell. Berlin*, 1872, No. 2). Butyraldehyde and alcoholic ammonia were exposed to the sunlight of last summer, and, after the removal of what would pass off by distillation, the residue was heated for a day to  $130^{\circ}$ – $150^{\circ}$ , and distilled in a current of hydrogen. By treating the distillate with acid and potash, and subjecting the purified material to fractional distillation in hydrogen, a product was at length obtained that passed over between  $166^{\circ}$  and  $170^{\circ}$ , and contained the greater portion of the conine. It resembles in most of its chemical characters the natural alkaloid, exhibiting in addition to those already described by Schiff in an earlier paper the reaction with phosphomolybdic acid. Numerous experiments on animals showed its poisonous qualities to be as energetic as that extracted from hemlock. In their boiling points and densities they agree: the coefficient of expansion of Schiff's conine is somewhat greater, and its solubility in water rather less than those of natural conine. The chief physical distinction lies in the artificial conine producing no rotation. The chlorhydrate of the latter base is more readily crystallized; the chloroplatinates are alike in habit and mode of decomposition with water. Its reaction with methyl iodide shows that the artificially formed base contains no hydrogen that can be replaced. The author believes its probable constitution to be represented by the formula:—

The supplement volume of Watts' *Dictionary of Chemistry*, which has just been issued, records the discoveries in pure and applied chemistry and the allied branches of other sciences that have been made since the publication of the fifth volume some years ago. The new volume, as bulky as any of its predecessors, has been prepared with the care and completeness which characterized the others. Many of the former contributors have again aided the editor: of them, Professor G. C. Foster has written the articles on Heat and Electricity; Dr. M. Foster, that on Proteids; and Prof. Roscoe, those on Light and the applications of spectral analysis to terrestrial chemistry and astronomy. Many of the articles on theoretical and practical subjects which are not signed, and are, it is presumed, from the pen of Mr. Watts, are of great value and interest, such as those on the Aromatic Series and Arsenic. Many very recent researches have been incorporated: Gore on Hydrogen and Silver Fluorides, Roscoe on Vanadium, Schiff on Conine, are all to be found here. Weidel's carnine, however, is not mentioned. In the description of so important a compound as hydroxylamine, it is to be regretted that a reference is not given to Lossen's original memoir rather than to a transcription. Minerals in certain cases have met with somewhat meagre treatment; Beustite, for example, is described as "a shining mineral, containing lime, potash, and soda," while of groppite, although the mineral is mentioned, the composition is altogether omitted. In some cases the authors have not selected entirely new material. Of iron are recorded facts that are certainly not new; while some of these (to give an example, the property of iron to remain unoxidised in pure water) appear to owe their presence here to their having been rediscovered and communicated afresh to the Chemical Society.

Attention is directed in *Im Neuen Reich*, No. II., 1872, to the circumstance that in September next half a century will have elapsed since, at Oken's instigation, the *Deutsche Naturforscherversammlung* held their first meeting at Leipzig. It was determined last year at Rostock that the city which had the honour of founding the association should be chosen for the celebration of the anniversary.

We learn from the *Revue scientifique* that it is proposed to organize an International Medical Congress at Vienna, in 1873, during the season that the International Exhibition is open.

Letters from Palermo, Rome, and other towns in the south of Italy, mention a fall of red or blood-coloured rain on the 10th and 11th of March, after atmospheric conditions which had led M. Tarry, of Paris, and P. Denza, to expect such a phenomenon. The particles of sand which cause the colour are found on analysis to be exactly similar to the sand of the African deserts.

### Philology.

- The *Philoctetes* and the *Trachiniae* of Sophocles. By F. H. M. Blaydes. Williams and Norgate, 1870-1871.
- Sophocles: the Plays and Fragments. Edited by Lewis Campbell. Vol. I. Clarendon Press Series, 1871.

MR. BLAYDES' *Sophocles* is one of the class of books that is not pleasant either to read or to characterise when read. With as much conscientious labour as has been spent upon it—or with at most two hours more, to correct several errors of the class intermediate between misprints and careless writing—a competent scholar could have produced a good critical edition of Sophocles, with neat and clear exegetical notes where wanted. If Mr. Blaydes has not done so, it has been for want of knowing what a good critical edition is, not for want of zealous effort to produce one. His notions of the limits of conjectural emendation are very wide—so far, he has a right to his opinion, though other scholars might differ from it. But he has personally collated several MSS. for his edition, and he would not be self-condemned if he had merely come to the conclusion that the MSS. of Sophocles are of so little authority as to leave a wide range of licence: his real fault is that, conceding him as much licence as he will, he has no notion of the direction in which to employ it.

A probable conjecture will account for the reading found in the corrupt text: but Mr. Blaydes' conjectures hardly ever even attempt to do so. In spite of his inspection of several MSS., he has never learnt what constitutes a *facilior lectio*: and as to the other familiar canon, that one should prefer the reading *cujus difficilior interpretatio*, he not only ignores it, but reverses it. If a passage is hard, it is corrupt: any group of words that will make it easy, and that will fill up its place in the metre, is, in his view, a probable conjecture. Peculiar as such principles of criticism are, and inapplicable to the text of any writer, they are especially unhappy when applied to that of Sophocles. For anyone who knows Sophocles well will confess that he is a very difficult writer, and that many of his difficulties arise from idiosyncrasies or refinements of diction: in consequence, an editor who sets to work to sweep away all such difficulties is convicted, *prima facie*, of ignorance of his author:—nor in the present case does a detailed examination do much to set the conviction aside. At any rate, it is safe to say that, if Sophocles had written the simple things Mr. Blaydes makes him write, the dullest and sleepest of mediaeval scribes would never have written anything else, and least of all what we actually read.

Three instances may suffice, taken from a few pages of the later and perhaps the better of Mr. Blaydes' books, to show how recklessly he indulges in conjecture, sometimes as the readiest way of escape from the slightest difficulty, sometimes, it seems, from mere gaiety of heart. On *Trachin.* 667—

κακὸν μέγ' ἐκπράξας ἀπ' ἐλπίδος καλῆς,

it was perhaps worth an editor's while to prove, by a few illustrative quotations, that ἐκπράσσειν in the Tragedians often means no more than "accomplish"; though the fact could be ascertained from a lexicon, even if he had omitted it. At any rate, Mr. Blaydes does quote two passages from Sophocles and three from Aeschylus to prove it, and one would suppose no more was wanted. But he cannot keep his red chalk pencil from correcting Sophocles, as though he were touching up a schoolboy's lambics: he begins his note, "Perhaps μέγα ῥέξας," and then goes on to show how needless the conjecture is, by illustrations of the vulgate.

*Ibid.* 672, he gives one or two illustrations (and here at least illustrations are not superfluous) of the construction οἶον ἦν φράσω . . . θαῦμ' ἐνέλπιστον μαθεῖν: and then concludes his note, "Qu. οἶον νῦν φράσω": and this he actually puts into the text, heedless of the objection to the long syllable before the cretic; though both here and very often he leaves the vulgate to stand as the heading of the note, when he has introduced in the text an alteration, absurd or otherwise; a practice sufficiently confusing to the reader.

Lastly, in v. 718 of the same play, we have the perfectly simple words πῶς οὐκ ἀλεῖ καὶ τόνδε. On this occurs this note: "καὶ τόνδε" 'Also him?' Hercules. Qu. 'μὲν ἄνδρα.'

From the *Philoctetes* it will be enough to cite one choice bit of comparative philology: "From the Greek σῶλος comes our English 'swell.'"

At the same time, a man who tries every possible conjecture must sometimes hit upon a right one. In the preface to the *Trachiniae*, we are told that the editor, on arriving at *Antig.* 1037 (for he threatens to do the whole of Sophocles), "was struck first with the singularity of the use of the preposition πρὸς, and then with the gender of the noun ἤλεκτρον, which should be neuter. This led me at once to the obvious correction τὰπὸ Σάρδεων ἤλεκτρον, which I found amply confirmed by the reading, hitherto neglected, of L., τα (supr. ὄν, a. m. pr.) προσάρεων." This suggestion seems really probable, and though another, which follows on the next page, ποῖος οὐκ ἔσται ἑλικῶν—"What Helicon?" (for λιμὴν, *O. T.* 420), is in Mr. Blaydes' wildest manner, we may hope that the work will improve as it goes on. It is perhaps as well that the two least interesting plays have been selected for these unhappy experiments.

It is also not to be regretted that Professor Campbell has begun, according to the common order, with the three great Oedipodean tragedies. His edition is one which no one can read without finding his knowledge of Sophocles substantially increased; and this is as high a success as can be expected by an editor or demanded from him, even without his readers being satisfied in all points with the execution, or still less able to agree with him in all details of opinion.

The first point in approaching Sophocles that will demand the study either of a tasteful reader or a judicious editor is, no doubt, the marked character of the poet's style. Anyone who claims to know him at all must have a sense of this character, sound even if rather vague: but most readers of the poet probably think it too subtle and too complicated for its features to be classified on a grammatical basis. This task, however, Professor Campbell has undertaken, in his Introductory Essay on the Language of Sophocles; and it is

here perhaps that the highest merit of the present volume lies. With so many-sided a subject to treat of, it is scarcely possible that any treatment can be quite exhaustive; but to detect omissions in the work would require at least as thorough study as the writer's own, and it is scarcely possible to find fault with the lucid and symmetrical arrangement. One slight defect of execution, however, must be noticed: Professor Campbell undertakes, very properly, to indicate by the letters *lyr.* when a phrase cited comes from a lyric passage: now this mark is several times accidentally omitted.

As to textual criticism, this edition is rather conservative in its general character: which is certainly a relief after the vagaries of Mr. Blaydes, and seems judiciously supported by argument. At the end of the Introductory Essay are a few remarks on "the Peculiarities of Language in Sophocles considered with reference to the settlement of the Text," among which we have this: "We are often justified in saying, Sophocles may have written what we find: he cannot have written what is proposed instead. It has not the Sophoclean colouring; it is like a raw touch on a picture ill restored." But it is of course impossible to quote in detail the treatment of all the corrupt or doubtful passages of the three plays; and with less than this it is scarcely possible to give more than a general statement on the views of a competent editor, applying acknowledged critical principles. It may be noticed that the critical notes are wisely kept separate from the exegetical: and that in the former the connecting words (between the symbols of MSS.) are in English, not Latin.

With the exegetical notes there is one fault to be found: they are too short. They are written too much from the editor's point of view, too little from the reader's. They take for granted a knowledge of the history of the passage commented on, and, to anyone not familiar with that history, and not knowing the various views that have been held, so as to recognise a mere allusion to them, they scarcely amount to a clear and complete statement, first of what the editor thinks it may mean, and then of what he thinks it does. Now it is not required of a first-class editor that he shall write a school-book, suited to the capacity of a student reading Sophocles for the first time: but an edition is less useful than it might be when it requires or presupposes the use of half a dozen others, some of them less valuable than itself.

One other censure it may be allowed to pass upon the book. No one could produce a good edition of Sophocles without possessing a good and sound taste, and Professor Campbell is not destitute of so essential a requisite: but there are a few points, both in the introductions and in the notes, where it may be doubted whether either Sophocles or his commentators have been duly appreciated. The appendix to the introduction to the *Oedipus Tyrannus*, "on the so-called Irony of Sophocles," really amounts to no more than this—"Irony, if understood to imply mockery, is not a proper name for it." This was perhaps just worth saying: but in saying it, the editor seems to deny that it is a real and marked characteristic of the poet. He quotes the alleged instances of it, quotes similar instances from Shakespeare and Tennyson, and then says, "Is this irony or pathos?" But surely it is a form of pathos so distinct from others as to deserve a separate name: if the received name is not the best possible, give us a better, but do not throw doubt on the existence of the thing.

On the *Antigone*, there are some judicious remarks as to the sophistical element which mingles in it with the tragical: but it hardly appears as though the relation had been adequately grasped, either between these two elements, or

between the main current of classical sentiment, and the thin vein of romantic passion and play of character that mingles with it. Professor Campbell is not the first editor who assigns v. 572 to *Antigone*; but he sees that the difficulty of the passage is not cleared up by that single alteration, so that he gives 574 and 576 to the chorus. This, it is true, extenuates the technical objection to the three actors all entering into conversation, and interrupting each other, in the course of a *stichomythia*, and this in an early play: but, if one may venture an assertion in so delicate a matter of feeling, the *Antigone* of Sophocles would scarcely have said "ὦ φίλατ' Αἴμον" to his face, and would have been quite incapable of such an apostrophe in presence of an unsympathising audience. The speech just suits the warm-hearted and impulsive Ismene: her kindly feeling towards her cousin and prospective brother-in-law may surely account for the fact that "there is greater bitterness in this line than in any other speech of hers." No doubt τὸ σὸν λέχος in the next line is a difficulty: "the marriage you prate of" is not a very satisfactory explanation, and to make Creon address *Antigone* if she has not spoken is harsh; but anything is better than to make her speak. Can the words imply a threat to Ismene, πολλὴν μιν χρόνον παρβενεῖσθαι? Creon was quite capable of saying, "Don't trouble about your sister's husband: I shall have enough trouble in finding you one."

In the same play, v. 751, the note begins "τὴν δὲ ἰ. ε. σέ:" and this view is supported by argument as "the obvious meaning." Now, in vv. 1231 *sqq.*, it is no doubt right to reject the far-fetched view, that Haemon's motive in drawing his sword was misunderstood: but from his mad act, in presence of the very corpse of his love; and followed even then by immediate repentance, it surely cannot be inferred that he would threaten his father's life deliberately—rather the reverse. Creon no doubt so understands him: but he is in at least as high a passion as his son, and of a more suspicious nature.

The lines 905 *sqq.* are rightly defended from spuriousness, though not from bad taste; but instead of the editor saying simply that the story of the wife of Intaphernes must have become popular in Ionia, because it is "a precarious supposition" that it was derived by one author from the other, one would have liked a reference to *O. C.* 337 *sqq.*, both as a proof that Sophocles was not incapable of an impertinence, and as increasing the likelihood that Herodotus was the direct source of both impertinences. In the latter passage the pedantry is even more gratuitous, though the sentiment is less offensive.

It is ungracious to part with expressions of dissent from a book deserving so much respect: for respect is just the word for the feeling raised by the study of so thorough and honest an edition. So it may be noticed that Professor Campbell seems to clear up one apparent obscurity in the story of the same play, viz. how Haemon got into the vault before Creon, yet not in time to rescue *Antigone*. He sees a hint at this in the word λυθοσπαδῇ in v. 1216: "In preparing the vault, an opening had been left through which the victim was thrust into the chamber. This opening was then roughly closed with stones. Through there Haemon had passionately torn his way. And the cleft so made by him is the ἀρμός χύμυτος λυθοσπαδῆς." W. H. SIMCOX.

The *Bacchae* of Euripides, with a Revision of the Text and a Commentary by R. Y. Tyrrell, M.A., Fellow and Tutor of Trinity College, Dublin. Longmans.

For interest and importance the *Bacchae* confessedly holds a high place among the extant tragedies of its author. Even Macaulay, in spite of his general depreciation of Euripides,

admitted the transcendent merit of this particular tragedy. The free and flowing, but sometimes inaccurate, translation of Milman has made it accessible to the English reader; and the special editions of Elmsley, Hermann, and Schöne, have contributed largely to its criticism and elucidation.

Mr. Tyrrell's admirable Greek verses in the *Hesperidum Susurri* have already shown that he has one at least of the qualifications required in an editor of a Greek tragedian. His introduction, which includes a disquisition on the religious and moral import of the play, combating the common view that it is a recantation of rationalism, strikes us as the best part of his work, whereas the general excellence of his commentary is impaired by a slight unevenness of execution, while his recension of the text, though often ingenious, is sometimes open to grave objections. It will be convenient to limit ourselves to a notice of some of the points in which Mr. Tyrrell's text differs from the ordinary editions. At line 23 we find a distinct improvement in the transfer of line 54—*μορφὴν τ' ἐμὴν μετέβαλον εἰς ἀνδρὸς φύσιν*—from a place where it either is otiose or, at the very best, only helps out the slight ambiguity of the previous line. The passage now runs thus:—*κάκει χορεύσας καὶ καταστήσας ἐμὰς τελετὰς, ὧς εἶην ἐμφανὲς δαίμων βροτοῖς, μορφὴν ἐμὴν μετέβαλον κ. τ. λ.* This happy alteration is due to Mr. Allen, who is also to be credited with the restoration—*στεφάνωσέν τε δρακόντων στεφάνοις, ἔθεν ἄγρην θηρότροφον μανάδες ἀμφιβάλλονται πλοκάμοις* (where the Palatine MS. has *θηροτρόφοι*; the Laurentian *θυροσόφοι*, which is the common reading).

In line 25 his text is less satisfactory. The passage is generally printed thus:—*πρώτας δὲ Θήβας . . . ἀνωλόλυξα, νεβρίδ' ἐξάψας χροὺς, θύρσον τε δοὺς εἰς χεῖρα, κίσσινον βέλος*. Both the MSS. have *μέλος*, while *βέλος* is due to Henry Stephens, who asserted (falsely, it is alleged) that he found it in his "Italian MSS." We are willing to consider the word as, at the best, a conjecture only; but even then, we cannot help accepting it as a true restoration of the original text. Mr. Tyrrell, however, prints *Κίσσινον μέλος ἀνωλόλυξα*: the verb is thus made to govern *Θήβας* and *μέλος*, the intervening words being parenthetical. Now, firstly, the construction thus gained is harsh; secondly, there is no ground for our annotator's assumption that the Kissian minstrels of Susa, "though generally spoken of as mourners, no doubt sang all kinds of orgiastic strains;" and lastly, beyond the general fact of Dionysus' having passed through Persia, there is no proof alleged of any connection whatever between him and the Kissians in particular. On the other hand, our editor's arguments against *βέλος* fail to convince us: his first allegation is that Euripides never applies *βέλος* to a *thyrsus*; this we admit, but we are defending not the application of *βέλος* to the thyrsus but rather the full phrase *κίσσινον βέλος*, where the epithet may be regarded as one of the well-known "limiting" epithets, of which *πτηνὸς κύων* is an exaggerated instance. The descriptive touch is most natural when we remember that the thyrsus is here mentioned for the first time in the play (and, indeed, for the first time in extant Greek literature). Further, line 733, *θύρσοις ὠπλισμένοι* shows that the poet regarded it as a weapon or missile; and lastly, in the *Dionysiaca* of Nonnus (the authority of which will be admitted by Mr. Tyrrell, who is as fond as Hermann of quoting it) we find, in the 43rd book alone, *κισσοφόροις βελέμοις, κισσὴν ἔγχος, θύρσος ἀκοντιστήρ, and χρεῖονα θύρσον ἐάσας διζέει βέλος ἄλλο*. When Mr. Tyrrell tells us twice over that *θύρσος* is expressly distinguished from *βέλος* in line 761, he forgets to notice that the contrast in that passage lies between *θύρσος* and *λογχὼ τὸν βέλος*.

At line 884 we have *ἀρ' ἐν παννυχίοις χοροῖς θήσω ποτὲ λευκὸν πῶδ' ἀναβαλχεύουσα, δορὰν εἰς αἰθέρα δροσερὸν ῥίπ-*

*τουσ' ὡς νεβρὸς κ. τ. λ.* The note runs thus:—"I read *δορὰν*" [for the MS. reading *δέραν*] "*the bacchanal fawnskin*. *ῥίπτειν* . . . cannot well be applied to the neck." To this we reply that Euripides never uses *δορὰ* as equivalent to *νεβρίς*, but (when *νεβρίς* itself is not used) always prefers a periphrasis, e. g. *καταστικτοὶ δοραί, νεβρῶν δοραί, νεβροῦ δέρας, νεβρῶν παμποίκιοι στολίδες*. Next, *ῥίπτειν* can be applied to the neck, for Pindar has the phrase *ῥιπαίχεν σὺν κλόνῳ*. Lastly, it is awkward, if not ludicrous, for the chorus in the same breath to compare itself to a fawn and to speak of "tossing the fawnskin into the dewy air."

In line 986, Kirchoff and Mr. Tyrrell independently propose *ὀριδρόμων* for *ὀριδορόμων*. The latter states apologetically that *ὀριδορμος* "has the analogy of *ὀρίβακχος* and *ὀριβάτης*." He might have added *ὀρίκτυπος* and *ὀρίπλανος*, or, better still, have told us that the word, so far from being a vague and shadowy conjecture, has a real existence (in Nonnus, *Dion.* 5, 229), although Liddell and Scott do not happen to say so.

The limits of this notice prevent our discussion of other points of textual criticism (not to mention exegesis) suggested by Mr. Tyrrell's book; but we cannot lay it down without commending it to scholars as an interesting addition to the literature of the subject.

J. EDWIN SANDYS.

Stamm's Ulfilas, neu herausgegeben von M. Heyne. Fünfte Auflage. Paderborn: Schöningh.

THIS work has received so many improvements and additions from its latest editor, Dr. Moritz Heyne, that it has in its present shape little more than the title in common with the first edition of 1858. In the first place the text has undergone a thorough revision, based on the results of Uppström's labours, whose accurate study of the difficult Gothic MSS.—most of them palimpsests—enabled him to introduce many hundred corrections into the received text. The fact that all of these corrections have been incorporated into the text of the present edition alone gives a high value to the work for advanced scholars no less than beginners, for whom it is mainly intended. The interests of the critical student of Gothic are also consulted in the various readings of the Milan MSS. and the marginal glosses of the *Codex Argenteus*, given at the foot of each page. The text is followed by a full, though, of course, not exhaustive, glossary, and a grammar, comprising phonology, flexion, and syntax, of which the two first sections have in the present edition been entirely recast, and brought up to the present state of Teutonic philology; the syntax, however, has been left in its original form, which, although brief, is clear and accurate, and gives all that can be required by the majority of students. The glossary is followed by a very useful appendix—a list of over fifty words, which in consequence of Uppström's corrections will have to be expunged from the dictionaries. The latest addition to the Phonology is Westphal's important "Auslautgesetz," of which Dr. Heyne gives a brief abstract.

The only fault to be found with the book is the omission of the Vienna runes and the Gothic distich, which, although corrupt and of comparatively small value, ought to have been added for convenience of reference.

After looking through such a work as this—so unpretentious in form, so thoroughly scientific in execution—we cannot help thinking that the high character of German philology is mainly attributable to the excellence of the textbooks it puts into the hands of beginners, who are thus trained to a methodical and intelligent habit of study from the very outset.

HENRY SWEET.

*Pantohatantra*; ou, Les Cinq Livres, recueil d'apologues et de contes, traduit du sanscrit par Édouard Lancereau, membre de la Société asiatique. Paris, 1871.

PROFESSOR BENFEY, in the introduction to his translation of the *Panchatantra*, has so exhaustively treated the literature of this remarkable Sanskrit book that he has left but a few scattered gleanings for those who succeed him. Every story is there carefully traced through its various subsequent forms; and his translation, though based on Kosegarten's edition, has corrected its not unfrequent errors by a collation of new MSS. Still his valuable book is hardly adapted for the general reader. Its very fulness makes it rather wearisome; and M. Lancereau has done good service in giving us its general results in a compact and readily available form. His preface gives a short sketch of the various versions and imitations which gradually naturalised these old apologues in every literature; and in his notes to his translation he adds brief references to the different books, where the reader will find a reproduction of each several story, and many of these references are added from his own reading. His translation is accurate; and the whole volume will be of great service to any one who wishes to trace the literary history of any particular apologue.

The only fault which we have to find with the book is that M. Lancereau has confined himself too much to the "Einkleitung." Thus he has omitted to take advantage of the additions which were given by Prof. Benfey and some of his contributors in the *Orient und Occident*, and he never refers to the former's reviews in the *Ausland* for 1858 and 1859. Benfey has there shown (cf. *O. u. O.* ii. 169) that with regard to the cycle of stories in the *Panchatantra* and other similar collections there are three distinct "moments" in the history of their transmission. Their origin is generally Buddhist, and it is in Buddhist books that we are in most cases to look for their oldest forms; they were thence adapted by the Brahmins and incorporated in their Sanskrit literature; and it is from these Indian adaptations that they have spread westward over Europe. M. Lancereau omits all notice of these points, and treats the *Panchatantra* too often as the original source, and not as merely one of the incidental stages of transmission.

In the third volume of *Orient und Occident*, there was a very interesting paper by Benfey, and another by Bastian, on the Siamese version of the *Panchatantra*, the *Nonthuk Pakkaranam*, i. e. *Nandaka-prakaranam*, or the history of the bull Nandaka, which is a version of the first two books of the Hindu collection;—only there it is the merchant's bull Sanjivaka which is left in the forest, and Nandaka continues the journey with his master, while in the Siamese version the names are reversed. Benfey remarks: "diese siamesische Bearbeitung des *Pantschatantra* wird wahrscheinlich auf die Geschichte dieses Werks ein neues Licht werfen, und es ist sehr zu wünschen, dass Hr. Dr. Bastian sie vollständig veröffentliche." No reference to this version is to be found in M. Lancereau's notes. Dr. Bastian in his paper gives a translation of the Siamese version of "The Sindpiper and the Sea" (Lancereau, i. 13), "The Grateful Beasts and the Ungrateful Man" (the second fable in Benfey's appendix to the first book, from the Berlin MS.), "The Wicked Tiger" (which is partly connected with the fourth fable of the fifth book), "The Ape and the Sparrow" (Lancereau, i. 18, 19), and "The Foolish Friend" (Benfey's appendix to the first book, story 12). With regard to the eighteenth and nineteenth fables of the first book, "Les Singes et l'Oiseau," and "Le Passereau et le Singe," M. Lancereau has himself remarked that the latter fable "n'est qu'une seconde forme de la précédente;" and Benfey had conjectured in his introduction, p. 271, that it was a later

interpolation, as it is omitted in *Somadeva* and the Arabic version, and is transferred in several of the MSS. to the fourth book, just as it is inserted in the *Hitopadesa* in the third. It is also omitted in the Siamese version, and Benfey remarks in a note: "die von mir an dieser Stelle ausgesprochene Vermuthung findet in der vorliegenden Mittheilung ihre Bestätigung." The Siamese fables frequently differ widely from their Sanskrit form, but their variations are often of great interest.

M. Lancereau had probably finished his work before the publication of Prof. Benfey's letter in the *Academy* for August 1 (vol. ii. p. 387), or he would no doubt have alluded to the important Syriac translation of *Kalilah and Dimnah*, so fortunately discovered by Prof. Bicknell, in August 1870, in the episcopal library at Mâridin. We await the publication of this invaluable MS. with the liveliest interest. If, as Prof. Benfey hopes in his letter, we should be able by its means "completely to restore the Sanskrit form of the original in all essential points," it would throw a ray of light on the history of these apologues at the very point where it is most enveloped in obscurity.

E. B. COWELL.

#### DISCOVERY OF THE OLDEST REVISION OF THE PANCHATANTRA.

##### TO THE EDITOR OF THE ACADEMY.

SIR,—You were good enough to insert in one of the numbers of your journal for last August (vol. ii. p. 387) a notice of the discovery of the Syriac version of the Indian original, the first five sections of which have been preserved in Indian literature under the name of the *Panchatantra*. May I ask you to accord a place in your widely circulated journal to the following account of another discovery scarcely, if at all, inferior in interest to the preceding.

In my work on the *Panchatantra* (vol. i. p. 5, and preface, pp. xviii, xix) I called attention to the importance of the southern recension of that collection, and remarked that the variations of this from the older recension, as preserved to us in the effluents of the Pehlevi translation (sixth century A.D.), are, comparatively speaking, excessively slight, and that therefore the very considerable transformations which the MSS. of the *Panchatantra* hitherto known exhibit must have taken place posterior to the date of the southern recension.

This view was founded in the main upon Dubois' translation of the *Panchatantra* (*Le Panchatantra ou les cinq ruses. Fables du Brahme Vishnou Sarma &c.* Paris, 1826), but owing to the character of this translation (cf. vol. i. p. 5, of my work) could not be raised to the rank of a certainty.

Through the kindness of Mr. A. Burnell, who has rendered such eminent services in the collection and investigation of Sanskrit MSS. and works, I have been put in possession, a few days since, of a MS. of the southern recension, which in the fullest manner confirms the view which I had ventured to express.

In the fables and tales, this recension agrees perfectly—with a few quite insignificant exceptions—with the Arabic version, and makes it not improbable that it assumed the form which it exhibits in the MS. before me, not very long after the Sanskrit original came to Persia.

In the first book, it contains but one story which is not to be found in the Syriac and Arabic texts; and one fable is transposed. In both cases it agrees with the *Hitopadesa*, the close affinity of which to this southern recension I have called attention to in more than one passage of my book. But the agreement of the *Hitopadesa* with the MS. before me is far greater than I could have suspected with the materials then at my disposal. Apart from the changes which the editor of the *Hitopadesa* has permitted himself to introduce, he seems to have taken mainly this southern recension as his basis, and in this way we obtain a new piece of evidence for the determination of the date at which the latter must already have existed. The publication by Aufrecht of Ujjvaladatta's commentary on the *Unâdi-Sûtras*, which mention the *Hitopadesa*, has proved beyond a doubt that the latter is older than the time of Ujjvaladatta (twelfth-fifteenth century A.D.); and hence it follows that the recension of the southern *Panchatantra* which forms its basis is older still. If this be true, the date of this

recension would fall between the sixth and about the twelfth century of our era.

To turn to the second and fourth books: the MS. before me agrees in every particular as to the stories with the Arabic text. The third book shows a variation, which it again shares with the *Hilopadesa*. A further variation from the Syriac and Arabic texts agrees with the other recensions of the *Panchatantra* known to me. This together with another variation in the fifth book form, so to say, the link which serves to unite the southern recension, which we must regard as the oldest, with the other and later versions.

It is not necessary to trace these relations further in detail at present, as the introduction to the edition of the Syriac version, which we hope soon to be able to publish, will explain the whole matter fully. At the same time it is not unlikely that either the writer of these lines or some other scholar in this field may be able to publish an edition of this oldest, and undoubtedly most important, recension of the *Panchatantra*.  
Göttingen, March 16, 1872. TH. BENFEY.

### RESEARCHES IN TANYORE.

#### TO THE EDITOR OF THE ACADEMY.

SIR,—Since my last letter I have made several discoveries in the Palace Library here. Among MSS. of Sanskrit books already known I have found two *Grantha* copies of the rare *Harshacarita*; one of these contains only the beginning, the other ends abruptly with a short 8th chapter like the MS. described by Dr. Hall (*Vāsavadattā*, p. 53); it therefore is likely that this curious romance was never finished. Both MSS. begin with the second half of the second verse quoted by Dr. Hall; they are old for palm-leaf MSS. (seventeenth century), and are very correct.

In the same place I have found a palm-leaf MS. of the hitherto unknown medical treatise, the *Bhela Sāmhita*, which closely resembles the *Caraka-S*. This MS. has been copied from a defective original, but what is left of this ancient\* treatise is very interesting.

There are in the same library many new lexicographical works, some of which are attributed to *Harsha*, *Bāṇa*, and other well-known writers. They mostly seem of little value, and of doubtful authenticity. There is however a *Bhoja nighaṇṭu* (*Nāmamālīkā*), which is most likely the real *Kośa* referred to (I cannot say quoted) by later commentators. It contains in three sections and about 320 *śloka*s synonymous names for the gods (*Indra*, *Agni*, *Varuṇa*, *Siva*, &c.), and their belongings, for celestial and for terrestrial objects. The MS. (which is in the Telugu character) is far from correct.

The names of the early dramatists mentioned in the *Mālavikāgnimitra* are given in *Kāṭya*'s Commentary (also in the same library), as *Bhāsa*, *Saṃmilla*, and *Kaviputra*, or *Bhāsa*, *Kaviputra*, and *Saṃmilla*.

Elsewhere I have found MSS. of the *Vaikhāṇasa pravaraḥaṇḍa*, and of *Sāyana*'s commentaries on the smaller *brāhmaṇas* of the *Sāma-veda*.

When my edition of the *Sāmavidhāna* (which has long been nearly printed) is finished, I hope to undertake editions of the *Ārsheya* and *Devatādhyāya brāhmaṇas*.

The Madras government has directed me to examine a large collection of copies of inscriptions in the Telugu country; I hope to find some historical facts in them. The inscriptions of S. India seldom give any other date than the year of the king's reign; but as they exist in countless numbers, and often refer to contemporary kings of other parts of India, it must be often possible to restore the real dates. Sir W. Elliott has done this already in several cases, and with important results.

The most serious impediment to progress in this way arises from the numbers and size of the inscriptions. The one round the shrine of the great Siva temple in this place covers about half an acre of wall; it records donations by a king named *Keppā Kesari Varman*, a name quite unknown to local tradition, and another good proof of the entire worthlessness of the local legends (*Māhātmya*).

You will have seen already the first numbers of the Indian Antiquary, edited by Mr. Burgess. Dr. Jaeschke has finished the first part (120 pp.) of his great Tibetan Dictionary. Dr. Gundert's admirable Malayalam Dictionary will be finished in the course of a year, and then it is to be hoped that a real Tamil Dictionary may be undertaken by some competent scholar. Mr. C. P. Brown's Telugu Dictionary leaves

\* It is mentioned by the *Caraka-S*. as one of the authentic medical *Sāmhitas*.

nothing to be desired. I have happily been successful in my endeavours to induce the learned Basel missionaries to bring out a Tulu Grammar. This interesting Dravidian dialect, which must soon become extinct, is of the greatest importance for Dravidian comparative philology. This grammar is already in the press. It will include a select vocabulary.

Tanjore, Feb. 29, 1872.

A. BURNELL.

### Contents of the Journals.

*Hermes*, vol. vi. pt. 3.—M. Haupt: Coniectanea. [Emendations of places in Plutarch's *Morals* and the *Metamorphoses* of Apuleius.]—A. Luchs: On Plautus. [On the scanning of *nescio*, with remarks on the text of sundry passages.]—W. Dittenberger: Roman names in Greek Inscriptions and Literature. [The present article is principally on the Greek mode of representing the Latin *u* and *v*. The writer maintains that *u* = *u* is older than *ov* = *u*, discusses the instances in which *u* is represented by the Greek *υ* or *ε*, and enumerates the equivalents of *qu*. The consonant *v*, when not entirely omitted, as in *Βελλαί*, is shown to be expressed by either *ov* or *β*, *β* being, during the imperial period, pretty common, though it never entirely supplanted the older equivalent: the occasional use of the diphthongs *av*, *ev*, *ov*, for the Latin *av*, *ev*, *ov*, is explained as due to the gradual approximation of Greek pronunciation to the modern usage. This highly interesting essay concludes with some remarks on the Greek representatives of the Latin *us*, and on the tendency to assimilate Latin names to familiar Greek words.]—H. Jordan: The Templum Deae Syriae at Rome.—Th. Mommsen: Fragments of Johannes of Antioch and Johannes Malalas. [The Greek text with an important historical commentary.]

*Revue Critique*, March 2.—The philological articles in this number are reviews (anonymous) of *Uricochea's Grammatica de la lengua chibcha* and Haag's *Vergleichung des Prakrit mit den romanischen Sprachen*; the former work receives very high commendation.—March 9.—"X." notices L. Dindorf's *Historici Graeci Minores*, and "P. M." (= Paul Meyer) *The Theory and Practice of Creole Grammar*, by J. J. Thomas, whose labours here find a competent and at the same time most appreciative critic.—March 16.—E. Tournier, in a careful article on W. Dindorf's *Lexicon Sophocleum*, pronounces the book to be an improvement on Ellendt, and less indebted to him than might be supposed; pointing out, however, marks of haste, and also omissions which give the work the air of being a *plaidoyer* in favour of Dindorf's edition of Sophocles.—The number concludes with a notice, by E. Sayous, of Ujfalvy's *Langue magyar*, Budenz's *Ugrische Sprachstudien*, and *Die finnisch-ungarischen Sprachen und die Urheimath des Menschengeschlechtes*, by D. E. D. Europaeus.

*The next number will be published on Wednesday, May 1, and Advertisements should be sent in by April 27.*

## General Literature.

**Lord Byron.** Von Karl Elze. Berlin: Oppenheim, 1870.

**Lord Byron:** a Biography, with a Critical Essay on his Place in Literature. By Karl Elze. Translated with the Author's sanction, and edited with Notes. John Murray, 1872.

THIS German biography of Byron with its English translation appear in England at an appropriate time. Moore's *Life* of the poet, first published in 1830, is now just ceasing to be copyright, and we may expect to see it shortly in a variety of cheap forms. It had remained as yet the only English biography of Byron having a certain completeness of scale and execution, and an authoritative character. It is richly laden—but, in its quality of biography *ab extra*, overloaded—with Byron's own letters and memoranda. These, first-rate of their kind, might very well be now separated from Moore's connecting and sometimes interfering narrative, and re-issued compendiously for general perusal. Moore's proper handiwork would then remain to speak for itself; and, whatever its merits of intention and performance, would certainly not satisfy all the demands of a Byronic student of the present day; and meanwhile the allegations put forth by Mrs. Stowe have deflected the centre of gravity of all materials relating to Byron, and require to be assessed, and, so far as yet possible, disposed of.

Professor Elze has produced a very readable narrative, of just about the right size: it is not lengthy, nor yet curt, but sets forth the remarkable and interesting career of Byron on a scale commensurate with the greatness of the poet. Of Byron's own writing, in the way of letters or memoranda, there is hardly a trace here, so that no biography could in this respect be more diverse from Moore's. The German professor shows a familiar current acquaintance, not only with that book, but with Byronic memoirs and materials in general. This indeed is no more than might have been fairly expected from a writer so well-read in English literature: the preface of his translator refers to previous works in which Professor Elze has proved his knowledge in this line—a *Selection from the British Poets, Reminiscences of a Tour through England and Scotland*, a critical edition of *Hamlet*, editorship of the *Year-book of the German Shakespearean Society*, a *Life of Walter Scott*. The last-named writer seems to share with Byron, to an extent scarcely warranted, the admiration of the professor, who speaks of Shakespeare, Milton, Byron, and Scott, as "four poets of unsurpassed genius"—reckoning in, however, the prose romances of Sir Walter as a part of his poetic performance. The final chapter is "On Byron's Place in Literature," and shows an amplitude of scope such as we expect from a critical-minded German. The remarks on Byron as the creator in literature of that great factor in modern thought which is termed "Weltschmerz" are remarkably sound and telling:

VOL. III.—NO. 46.

and it is curious for the English reader to be informed, though probably not far from the truth, that, amid the immense influence that Byron's poems have had all over Europe, the country in which they have produced least effect is England itself. In other respects this estimate of Byron's poetry is capable and pointed, without, perhaps, advancing anything that is very novel, or that transcends in keenness other studies from competent hands. Preceding this chapter is another on "Characteristics of Byron," holding a very even balance between the good personal qualities and the bad—such, for instance, as generosity and stinginess: Professor Elze is ready to believe in the first, without denying or dissipating the evidence in support of the second. Nevertheless it may be that, as regards the main typical image of Byron which the author has before his mind's eye, he is somewhat too much disposed to reject *à priori* such allegations as would tend to disfigure or remould it, and to determine that so-and-so is not true because it cannot and must not be true.

Naturally, the transaction to which the biographer would be most likely to apply this questionable test of truth is the mutual relations between Byron and his half-sister, Mrs. Leigh, or what is termed "The Stowe Scandal": and I think his resolute predisposition (however unconscious of any unfairness) to scout the whole story has not failed to leave a trace amid the many points of argument, of more or less cogency, that he brings forward to refute the allegations. That he disbelieves and contests the story is of course no matter of complaint, nor yet of surprise: everybody would wish to disbelieve it, most people appear to do so, and perhaps not even Mrs. Stowe herself would venture to say that the charge is *proved*—certainly we should dissent from her if she did so. Of all direct arguments for disbelieving it—apart from its inherent or antecedent improbability, which, I fancy, along with its unpleasantness, weighs rather too much with Professor Elze—the strongest appears to be the tenor of the letters addressed by Lady Byron to Mrs. Leigh about the time of the separation; letters which have been published in the *Quarterly Review* and elsewhere, and which do undoubtedly create a strong presumption that the lady who wrote in such terms could not have believed that the sister-in-law whom she was addressing had committed incest with the writer's husband. But it is not the less true that Mrs. Stowe, in her later book named *Lady Byron Vindicated*, has grappled with this difficulty; and has suggested—regarding the dates of the letters, ascertained or surmisable, and the degree of moral responsibility which Lady Byron may probably have imputed to Mrs. Leigh at the relative dates—considerations which sensibly diminish the weight of the letters in question as telling against the Stowe narrative. Professor Elze, in the body of his work, reproduces these letters of Lady Byron, with his own comments as to their inconsistency with the charge of incest: in a note at the end of his volume (the book *Lady Byron Vindicated* having appeared meanwhile) he continues the same line of argument, but he says not a syllable of the theory advanced by Mrs. Stowe in explanation of the letters. This is hardly fair: at any rate it is not the way to convince the reader who is tolerably *au fait* with the details of the controversy. The translator pursues a still simpler plan. What Herr Elze had said about the matter in the body of the book appears in its place, but the note has wholly vanished: it is neither translated where it occurs in the original nor incorporated with the text. The translator therefore simply ignores what Mrs. Stowe had found to say in reply to the evidence adduced in confutation of her original narrative. The American lady may well opine that the silence of the German as to one of her most important points, and the

silence of the Englishman as to her entire rejoinder, are a testimonial to the strength of her position. We should have preferred a different kind of testimonial; a resolute encounter with all the arguments or inferences put forward by Mrs. Stowe, and a demonstration, if practicable, of their fallacy or feebleness. That such a demonstration may still be forthcoming, we think extremely conceivable: that it has yet been supplied, we do not consider. The nearest approach to what is wanted is to be found in the letters written by Lady Byron's solicitors, Messrs. Wharton and Fords, and by Lord Wentworth: but even these letters, giving the amplest extension to their terms, only refer the real demonstration to the documents left by Lady Byron in charge of her trustees, and as yet unpublished—perhaps never to be published.

It is observable that Professor Elze, strongly as he opposes the charge of incest, expresses his conviction that this same was the dark and shrouded accusation against Byron which his wife communicated, at the very time of the separation in January or February 1816, to her counsel, Dr. Lushington. He also brings out, with more relief perhaps than it had received hitherto, the fact that rumours to the like effect were at that same time current in society, as accounting for the separation. Indeed, that this was so can hardly be doubted by any one who reads the letter of Shelley to Byron, dated September 29, 1816, and lately printed in the *Quarterly Review*: "Kinnaid . . . informed me that Lady Byron . . . was living with your sister. I felt much pleasure from this intelligence. I consider the latter part of it as affording a decisive contradiction to the only important calumny that ever was advanced against you. On this ground, at least, it will become the world hereafter to be silent." Now, if in 1816 Lady Byron accused her husband of the incest (or of attempting incest), the charge communicated by her to Mrs. Stowe cannot have been, as some have surmised, an insane or hypochondriacal hallucination of her after years, consequent possibly upon a supposed resemblance to Byron borne by Mrs. Leigh's daughter Medora, in character or otherwise; and, if in 1816 rumours of so abnormal an offence as incest were rife in society, it is difficult to see on what this could have been founded, unless on something patent to society in the conduct of Byron or of Mrs. Leigh—for as yet Lady Byron divulged nothing save to her counsel (though Herr Elze seems to doubt this), and the poet himself had not so much as published *Manfred*, now regarded by some persons as symptomatic. The letter of Shelley above cited may, in this connection, be very heartily welcomed by the vindicators of Byron and Mrs. Leigh. Shelley had then just returned to England from some months of intimate communion with Byron: he knew *Manfred* in MS., and himself, in the following year 1817, published his poem of *Laon and Cythna*, developing the connubial passion of a brother and sister as something guiltless in its essence. That Shelley, under these conditions, should write to Byron a private letter in which the rumour in question is treated as a mere utter calumny, and a refuted calumny too, seems to be one of the strongest items of evidence yet produced on that side of the debate. Before leaving this topic, I may notice that one observation of Herr Elze has a very inconsequent air. He says: "Lady Byron . . . employs, in the above-mentioned remarks on Moore's *Life and Letters*, the following words: 'If the statement on which my legal advisers (the late Sir Samuel Romilly and Dr. Lushington) formed their opinions were false, the responsibility and the odium should rest with me only.' This scarcely admits of any other interpretation than that she knew the facts she had stated, not from her own personal observation, but only as communicated to her through a third person; so that

ultimately the warp of this woof may turn out to be mere feminine gossip." But why should Lady Byron's assertion of her own sole responsibility in imparting a certain onerous secret to her counsel indicate that to herself the secret had been betrayed or hinted by some one else? Surely the not unnatural inference is wholly in the contrary direction—so far as *any* inference can legitimately be formed on this collateral point.

Among other occurrences of Byron's life, one that is treated with more than common fulness and interest by Herr Elze is the poet's connection with carbonarism and revolutionary movements in Italy. His slips in matters of detail do not appear to be numerous, though every now and then some such can be discerned. The name of the mother of Allegra was not "Miss Jane Clermont" (p. 204 of the translation), but Miss Jane Clairmont, ordinarily called by her friends "Claire Clairmont." The suggestion (in which Elze himself does not, however, believe) that Byron caused Allegra to be buried in England in order that the mother might have the opportunity of visiting her grave seems to be thrown out in ignorance of the fact that Miss Clairmont was then still living in Italy, which has since continued to be her home. Herr Elze demurs to the statement that Shelley avowed himself an atheist: "dass er sich, wie erzählt wird, wirklich mit Atheismus gebrüstet hat, ist wol nicht sicher verbürgt." This is not correct: for Shelley, not to speak of graver utterances on the subject, signed his name in the visitors' album at Montanvert with the addition—

Είμι φιλόσοφος δημοκράτης τ' ἄθεός τε.

Admirers of Shelley may with pleasure see the testimony borne by our author to the great influence which the works of that transcendent poet exercised in Germany at the date of the "Young Germany" movement, when Byron also was at the acme of his fame: "let it not be forgotten," he says, "that the poetry of Shelley, at that period, interested and inflamed the youth of Germany in a hardly less degree than Byron's." There is another point connected with Shelley which is persistently mis-stated by all sorts of writers, and by Herr Elze among them, and which it may be worth while to try to rectify here. Leigh Hunt (see his *Autobiography*, p. 320, edition of 1860) gives an account of the burning of the body of Shelley in August 1822, and of the demeanour, on that occasion, of Lord Byron and himself, in which there was nothing to reprehend. He then adds, "Yet see how extremes can appear to meet," &c.; and proceeds to record his own and Byron's unseemly conduct on the same spot on some other and subsequent occasion. "On returning from one of our visits to this seashore, we dined and drank: . . . we sang, we laughed, we shouted," &c. Elze follows a multitude to do evil, and represents the riotous merriment to have ensued immediately after the cremation, "when he [Byron] drove back with Hunt through the pine-wood to Pisa."

It remains to say a few words regarding the mode in which the translation from Professor Elze's work has been executed (apparently by the same gentleman who appends the initials "R. N." to an English rendering of some German verses with which his appendix concludes). The translation is on the whole correct and fluent. Now and then, however, a sentence is lumbering, or even sometimes ungrammatical—as the statement (p. 101) that "Byron . . . laid down on the deck": and throughout the translator assumes the right of deviating from his original in detail where he thinks fit. In many instances, this is not only allowable but advantageous: he omits some item of needless particularity for the English reader, or supplies some useful emendation or *addendum*. But this is not always the case. For example,

on p. 171, he omits a statement made by Elze (in summarising the book *Medora Leigh*) to the effect that Lady Lovelace gave Medora a sisterly reception in Paris; on p. 174, he misses, presumably through mere squeamishness, Elze's reference to Caligula's incestuous love for his sisters, appositely inserted to explain why some one had likened Byron to Caligula. Perhaps the same feeling has induced the translator to cancel, from p. 168, Elze's observation (pertinent though it is to the serious argument here in hand) that Byron, in his various love-affairs, was more seduced than seducer: and a still less manly or creditable motive may have dictated the omission, in the same context, of the German author's denial, also wholly pertinent to his argument, of the general immorality of continental married life. This is not the sort of translating to which an author of repute like Professor Elze deserves to be subjected (though indeed it appears that he saw the English version as it was passing through the press), nor by which reasonable British readers would wish to judge the work of a foreign admirer of one of their great poets.

I may add that the characteristic words of one of Byron's least refined mistresses—"Vacca sua, eccellenza"—which are correctly quoted by Elze, should not have been altered into "vacca tua": this, if not a mere slip in printing, is an attempted correction which only betrays ignorance of Italian usage and idiom on the part of its concoctor.

Even less approvable than the omissions just mentioned is the detraction in which the translator, in his preface, indulges regarding the venerable and noble-natured Trelawny, found worthy to be loved by Shelley; and not only regarding him, but the various other writers of Byronic memoirs, with the one exception of Moore. Moore's *Life*, as I have already had occasion to observe, is as yet copyright, the property of Mr. Murray: the same publisher produces the translation of Elze's work: and the proverb, "Vous êtes orfèvre, Monsieur, Josse," may recur to the memory of some readers.

We have, however, to thank the translator very heartily for a considerable body of apposite and interesting information which he has added in his appendix: as on the Byron lineage, and the taint of illegitimacy in it towards 1540; on the early poems of Lord Byron; and on his character as recorded in the personal narratives of the Rev. Mr. Harness, Lord Broughton, Mr. Finlay (who startled Byron in 1823 by his marked resemblance to Shelley), and Lord Harrington. A portrait of Byron at Cambridge, by Gilchrist (not particularly well engraved), and a facsimile of Byron's very first letter, dated November 8, 1798, when he was not much less than eleven years old, also enhance the interest of Mr. Murray's volume.

W. M. ROSSETTI.

**Sicilian Folk Songs.** [*Canti popolari siciliani, raccolti ed illustrati da Giuseppe Pitre. Preceduti da uno studio critico dello stesso autore.*] Vol. 2. Palermo, 1871. [*Canti popolari delle Isole Eolie e di altri luoghi di Sicilia, messi in prosa italiana ed illustrati dal Prof. L. Lizio Bruno.*] Messina, 1871.

I POINTED out the importance and interest of Pitre's collection of popular songs in No. 15 of the *Academy*. The present continuation possesses the same qualities in the same or even a greater degree, as it contains not merely lyrical productions, but other materials as well, including those of a ballad character. The separate sections contain *Ninni* or *Canzuni di la naca*, lullabies or cradle-songs; *Jocura*, songs for children or nursery-rhymes; *Orazioni* e *Cosi di Diu*, invocations and prayers; *Nnimini*, riddles; *Arii*, longer or shorter songs of seven or eight verses, subdivided into *Canzuni ad arii*, or simple lyrical airs, and *Storii ad arii*,

or songs with a narrative foundation; *Storii e Orazioni*, ballads and sacred legends; *Contrasti o Parti*, longer poetical encounters or duels (the shorter ones are called *sfige* or *dubbii*, and consist of a single question with the answer); *Satiri*, or satires; *Canzuni murali*, moral or religious songs; and finally, *Muttetti di lu palio*, songs in praise of successful racehorses. I will proceed to give a few short samples of the various contents of the volume. A nursery-rhyme runs:—

"Varvarutteddu;  
Ucca d' aneddu;  
Nasu affilatu;  
Occhi di stiddi;  
Frunti quatrata;  
E te' cca 'na timpulata."

("Little chin, Mouth like a ring, Pointed nose, Eyes like stars, Square brows, And there's a pat on the cheek.") Like the Scotch: "Brow brow brenty, Ee ee winky, Nose nose nebbly, Mouth mouth merry, Chin chin chueky, Catch a flee, catch a flee." Every one knows too the English: "Eye winker, Tom tinker," &c. Another Sicilian child's song is:—

"Babbalucieddu, nesci li corna,  
Nesci li corna ca veni tò nanna;  
Veni tò nanna cu 'na menza canna,  
E t' assicuta finu a la muntagna."

("Little snail, put out your horns, Put out your horns, for mother is coming, Mother is coming with half a stick, And will chase you as far as the hills.") So the Scotch: "Snail, snail, shoot out your horns, And tell us if it will be a bonnie day the morn;" and the English: "Snail, snail, come out of your hole," &c.

Amongst the *Orazioni*, we find prayers of a kind which are doubtless offered up in all parts of the world, and by a very interesting portion of the human race, namely, by maidens who wish for a husband. In Sicily, of course, the intercession of the saints is invoked, in the following terms:

"San' Antoninu,  
Mittitilu 'n caminu;  
San Pasquali,  
Facitilu fari;  
Santu 'Nofriu gluriusu,  
Beddu, picciottu e graziusu."

("Saint Anthony, send us [a wedding], Saint Pascal, bring it to pass, Glorious Saint Onuphrius, let him be handsome, young, and agreeable.") These *Orazioni* or invocations are addressed to all kinds of supernatural beings, from God to the souls of departed criminals (see *Academy*, ii. p. 58), and they contain petitions for a bridegroom, for the punishment of a faithless lover, for an easy delivery as readily as for the return of an absent son, for a fortunate number in the lottery, for the death of the evil spirits in the body (!), for protection against lightning, &c. &c. They form a very remarkable class, distinguished by their superstitious foundation from the *Cosi di Diu*, or purely religious morning and evening prayers addressed to God, the Virgin Mary, and the guardian angel, and referring to the welfare of the soul. They are also distinct from the *Orazioni* or sacred legends which appear in a later section, to which I now turn. This is the most extensive of any (pp. 114-378), and contains nothing but narrative poems of a secular or religious nature, the latter being by far the most numerous and the longest, and generally relating to the Virgin Mary. Many of these are very interesting, and have received poetical treatment in other languages; amongst the others, I may mention those relating to famous robbers and their deeds, from which it appears that the sympathies of the people incline to the side of these heroes in a way not altogether suitable to moral principles. At the same time some allowance should be made for the oppression under which the lower classes were formerly

suffering in almost all countries, and from which they are not even yet completely relieved, so that it is scarcely surprising to find the robbers objects of envy for their free life in the woods and mountains, and of admiration as standing protests against all kinds of oppression. Robin Hood and the Klephts in the popular poetry of modern Greece are represented in exactly the same light. The officials and servants of the government on the other hand are the objects of the bitterest hatred to the Sicilian populace, so that in their songs even the inhabitants of Hell refuse to associate with *sbirri*, or to permit their entrance, in a way that reminds us of Dante's "Chè alcuna gloria i rei ayrebbèr d'elli."

Of a very different nature is the poem *La Baronessa di Carini*, which tells how the Baron of Carini slew his daughter Catherine on account of a secret love affair with her cousin Vincenzo Vernagallo, in the year 1563. This is one of the best creations of Sicilian popular poetry, of almost unequalled beauty, and full of the most passionate tragedy strikingly set forth. There is a special edition of this poem, with an introduction and glossary by Salvatore Salomone-Marino (Palermo, 1870), which I have noticed in the *Götting. Gel. Ans.* for that year (No. 26). I pass over various other attractive poems in this and other sections of Pitre's collection, and only pause for a moment at the *Muttetti di lu palio*, as in spite of their simplicity they must have some interest for friends of the turf. They belong, in respect of their metre, to the class of poems called *Ciuri* (*Academy*, ii. p. 59), and are sung by successful jockeys in honour of their horses as they pass through the crowd of spectators after the race. Some of them date from an early period, and are preserved in localities where no races are now held. Here is an example:—

"E vaja, via!  
E la bedda mirrina  
Pri pigghiaricci l'acula ô patrui,  
Vulau comu lu ventu e junciu prima!"

("Away, away, The gray mare, To win the prize for her master, Flew like the wind, and arrived the first!") The prize here mentioned consists of a gilt wooden eagle (*acula*), hung with large silver coins. Another is:—

"E loria loria!  
Nta quantu cavaduzzi cc' è 'n Sicilia  
Lu cavaduzzi mio porta vittoria."

("Hurrah, hurrah, Amongst all the horses that are in Sicily, My little horse wins the day!") This is the last in the collection, and is followed by charming melodies for thirty-one of the songs, and finally by a short glossary, containing those words which have not been explained in any of the numerous notes on the text. Pitre has thus neglected nothing which could contribute to the intelligibility of his valuable collection, which offers a faithful mirror of the life, thought, and feeling of the Sicilian people. There remain, however, a good many difficulties in the language of the songs, which a reader who has not made himself at home in it will be glad of other help to overcome. This is offered, as regards the Sicilian dialect in general, and its variations from the forms of the *lingua illustre*, by Prof. Lizio Bruno's *Canti popolari delle Isole Eolie*, which contains a literal translation of all the songs into the literary language, and so makes it possible to obtain a tolerably complete mastery of those peculiarities. As to the special difficulties of vocabulary in the collections of Pitre, Vigo, Salomone-Marino, &c., they will nearly all be met by the admirable *Nuovo Vocabolario Siciliano compilato da Antonio Traina*, which will soon be completed, and which I noticed at length in *Gött. Gel. Ans.* 1871, No. 26.

I must add a few words concerning Lizio Bruno's work. Besides the translation just referred to, he has also com-

pared in detail the style and matter of each of the hundred *Canzuni* in his collection with the popular songs of other Italian provinces; a comparison which, he observes, is of the greatest importance to our knowledge of the true character of popular poetry, and proves to demonstration that the songs of different places retain a closer relationship than is generally believed, in spite of all their migrations and meltings into each other which modify their external features. Bruno also brings forward instances of more artificial poetical compositions, to show that the chasm which separates them from those of the people is not so profound as it appears, since the source of true beauty does not lie in painful effort, but in the spontaneous inspirations of the heart. And certainly some of his remarks on this subject supply food for reflection, which must tend to diminish our faith in the fertility of the human mind and the apparent abundance of its ideas. Perhaps, however, Bruno has been tempted by his extensive reading to multiply illustrations beyond what is necessary to establish his point. His critical and exegetical explanations are valuable and instructive, but he would have done better to omit the etymological remarks, and especially all the Greek etymologies; Diez's *Etymologisches Wörterbuch* does not appear to be much studied in Sicily. As to the poems themselves, they are almost exclusively love-songs, and many of them excellent of their kind. I quote the forty-fourth and the forty-eighth, with Bruno's Italian translation, to serve as a key to the Sicilian:—

"Su' ricivutu 'nto 'n palazzu d'oru,  
Posu li pedi e non passu cchiù ananti:  
Li porti e li finestri sunnu d'oru,  
Li ciaramiti di petri-domanti.  
Ccà intra siti vu', caru tisoru,  
È ccà lu Paradisu cu li Santi!  
Cridu chi la rigina è vostra soru,  
Lu figghiu di lu Re lu vostru amanti."

("Son ricevuto entro un palazzo d'oro. Poso i piedi (mi fermo) e più innanti non vò. D'oro sono le porte e le finestre; Di pietre-diamanti le tegole. Quà dentro ci siete voi, caro tesoro: È qui, coi santi, il Paradiso. Credo che la sorella vostra sia la regina, E il figlio del Rè l'amante vostro.")

"O frunti-spera, facci d'un giardinu,  
Sciuri chi t'aju avutu 'nta lu senu,  
Ssu to' nasuzzu è un vero gersuminu,  
Ssa to' buccuzza lieva ogni vilenu.  
Coddu di 'na carrabba cristallinu;  
Curpuzzu d'ogni grazia ripenu;  
Unni posa ssu pedi damascinu,  
Fa sciauru di ruosi lu tirrenu."

("O fronte-spera, o visu di un giardino, O fiore che ho tenuto nel mio seno È un vero gersmino questo tuo nasetto. Questa tua boccuzza toglie ogni veleno. Collo di una guastada di cristallo; Corpicciuolo di ogni grazia ripieno, Ovunque posa questo tuo piede damascino, Odora di rose il terreno.")

The beginning of No. 2. is noticeable, because it contains a mythologic allusion, a thing very rare in Italian popular poetry:—

"O bella siti 'n 'acula suprana,  
E siti un pocu grazziusa e fina:  
Nascisti 'nta li braccia di Tiana," &c.

("O bella, voi siete un'aquila sovrana, E siete un po' grazziusa e fina. Nascete fra le braccia di Diana," &c.; but it would perhaps be better here to read "un pocu," i.e. "non poco," instead of "un pocu"); and likewise the end of No. 4, on account of its expressive thought:—

"Cu bascia sta tò bucca zuccarata,  
No sputa, pi non perdiri a ducizza."

("Chi bacia questa tua bocca inzuccherata, Non sputa per non perdere la dolcezza.")

These specimens, as well as those taken from Pitre's first volume, illustrate sufficiently the character, or, in other words, the abundant flow and brilliant colouring of Sicilian love-songs. The length of the narrative poems in this second volume precludes citation, but what has already been said may suffice to draw attention to the popular poetry of Sicily in general, or to these collections of it in particular.

FELIX LIEBRECHT.

**The Story of the Plébisците.** From the French of MM. Erckmann-Chatrian. Smith, Elder, and Co.

IN the works of MM. Erckmann-Chatrian there are displayed many of those finer qualities of art which the few admire and the many disregard. Not, however, on account of these qualities, but on account of the quite negative merit of harmlessness joined with that faculty of style which in literary slang we term "readableness," did their works receive early notice and achieve early popularity in England. The public, which might well have fastened upon works with less claim to respect, happened to find pleasure in these; and to that fortunate accident we owe the possession, in comely English garb, of some half-dozen novels which sketch for us provincial France with the faithful minuteness of Jan Steen and the luminousness of Peter de Hooghe. Beyond provincial France—nay, beyond one country-side in all that field—MM. Erckmann-Chatrian rarely wander. The circle of their thought and work is almost as confined as is that of Jane Austen, though of course it is essentially different. It is at the same time more intensely localised, for while she knows few differences between Derbyshire and Hampshire, they mark the differences between villages almost adjacent, and one might profitably follow their stories with an ordnance map in one's hand and a *Guide-Joanne* at one's side to supplement the particulars they supply. If the thing they do were done less perfectly, one would tire of it—this ever renewed narrative of the peasant farmer, peasant soldier, peasant woman around Phalsbourg—just as, were they but less perfectly presented, one would tire of Miss Austen's squires' daughters, country gentlemen, and managing mammas. Like most true artists, MM. Erckmann-Chatrian recognise the limitations of their genius—whether consciously or instinctively, one does not greatly care—and if, in their case, the result on the one hand is an approach to monotony, such as is wholly avoided by the universal genius of Balzac, the result on the other hand is a fidelity quite incompatible with the universal audacity of *About*. *About*, brilliant always, is veracious chiefly when his story moves within the lighter circles of Imperial Paris. Wandering into the country, his pen remains amusing and caustic; but notwithstanding the accumulation of detail which his industry heaps up, he lacks the simple accuracy which MM. Erckmann-Chatrian appear to attain almost without an effort.

It is difficult to criticize *The Story of the Plébisците* with any assurance of impartiality; for not only has it, in common with many another work of the same authors, a political mission, but it is political from end to end; and even if one can lay aside political prepossessions in discussing a work which deals with the Republicans of 'Eighty-nine and the Imperialists of the First Empire, it is hardly possible that they shall have no weight when one discusses a work which vehemently praises or vehemently blames the actors in the most exciting struggle of one's own time. It may be urged that praise and blame are both dramatic, since they are expressed not by the authors in their own persons but by the characters of the story. But this plea, if ever made, will have to be disallowed when it is remembered that every wise and good man of the story is a French Republican,

while every scheming time-server is an Imperialist. Apart from this fact—which, if it be intentional, makes *The Story of the Plébisците* a missionary labour, and, if it be unintentional, shows in this treatment of a contemporary theme all lack of that insight wide and profound which gave to *Hohenstiel-Schwangau* its immense and abiding value—apart, I say, from this fact, which mars the book, however it came there, *The Story of the Plébisците* is a chronicle hardly less instructive than fascinating. The village life of Rothalp—treated in the earlier chapters—is painted in clear outline, with pure colour that will not fade. Its delightful freshness should be a relief to the novel reader. Soon, however, the village story merges into a chronicle of the war. The war, and not the village, is the main theme of the book. There is no elaborate analysis of character; yet the sketches of character are firm and true. Of these, the most important is that of the narrator—a dull, good miller, who voted "Yes," and saw the error of his ways when his wise cousin from Paris argued with him. This cousin, George, is in the present book the incarnation of good sense: he reminds one, therefore, of that other incarnation of good sense, Chauvel, the Protestant colporteur, in the *Histoire d'un Paysan*. The miller's wife and their son Jacob are slighter sketches. Grédel, the daughter, whom the narrating miller loves but little, but whom the reader will admire much, is a healthy, spirited, and unfamiliar figure; and there is real art in the way in which we are enabled to see her good qualities through a medium adverse to their display. There is wit as well as art in that sketch of the *sous-préfet* who enquires of the village mayor, "What is the spirit of your population?" and so interprets the answer that he may in his own turn report to the *préfet* the thing which is desired at head-quarters.

The Imperialists have M. Sardou, who writes *Rabagas*, that they may laugh and be re-assured: why should they not smile also when MM. Erckmann-Chatrian, from the other side, paint piquant portraits of the *sous-préfets* of the Empire? They may do this undoubtedly; and, notwithstanding differences, they may thank the authors of *Waterloo* and the *Conscrit* for having added by this *Story of the Plébisците* to the long list of vivid, spirited, and simple narratives which on readers who seek mental refreshment rather than mental exercise confer a pleasure and a boon.

With here and there an exception, the translation, now reprinted from the *Cornhill Magazine*, is in good and facile English; and the pictures, by Du Maurier and Hubert Herkomer, are, in the true sense, illustrations.

FREDERICK WEDMORE.

**The Bacchae of Euripides**, translated into English Verse, with a Preface, by James E. Thorold Rogers. James Parker and Co.

THE *Bacchae* are one of the standing problems of literary history, and Mr. Rogers' contribution to its solution is the most characteristic part of his pleasant little volume. His attempt is too ingenious not to be interesting, though the interest is partly the interest of an anachronism. He refuses to believe that a man who has thought out life so clearly as he assumes that Euripides had done can radically change his convictions at the age of seventy-five unless his faculties have been impaired: consequently he is induced to conceive the play as an insincere but splendid parable whose moral is that superstition is the only and the precious check on despotism. Such a parable would have been quite in place at the court of Archelaus; but, after all, the suggestion reminds us of Warburton, who found the Eleusinian mysteries in the Sixth Book of Virgil. The writer has been led to an extreme solution by disregarding the circumstances which attenuate the problem. If Euripides had been a thorough-

going rationalist, he would have come into collision with the homely mysticism of Socrates. In fact Greek paganism scarcely presented sufficient resistance to rationalism to consolidate it. No doubt Euripides' opinion of the received mythology was lowered by his fondness for dwelling on the obvious fact that it was used as a political machine of no creditable kind. But he probably remained a sincere polytheist just as Voltaire remained a sincere theist, though both rather preferred to keep at a distance from the objects of their belief, whose names were so often taken in vain in the society in which they lived. And of course Euripides gained more by transcendentalising anthropomorphism into nature-worship than Voltaire by substituting an abstract First Cause for the personal God of Christianity. Then we have to remember that the character and position of women was a subject which always had a strong though painful fascination for the woman-hating Euripides: in the Bacchic ecstasy (which, as Mr. Rogers points out, he probably witnessed for the first time in Macedonia), he found their consolation and emancipation. Nor would it be surprising if Euripides under new and stimulating conditions experienced, like Gentz, in his passion for Fanny Elsler, the strange phenomenon of a second youth: and it would be more satisfactory to find the explanation of the character of Cadmus here than in the cheap hypothesis of dotage. But whatever the true theory of Euripides' conversion, it did not involve such a break with his past as to warrant us in throwing doubt on his sincerity. Its modern analogue would be not a veteran socialist giving in his cohesion to ultramontanist, but a veteran man of letters admitting the pretensions of spiritualism. This reminds us of another mistake which runs through all the contrast between Euripides and Aristophanes; Mr. Rogers seems to assume that the division between the old and new school at Athens was mainly horizontal, whereas it was mainly vertical; all the questions of the day did not resolve themselves into questions of class politics. But the preface contains much instructive matter, though the main positions are questionable. The translation maintains an uniform level of manly elegance and vigorous fidelity. It may be read with pleasure, at least without effort, by itself, and with respect in the presence of the original. It is less rich and musical in language and metre than Dean Milman's, but it is free from the appearance of occasional feebleness; it looks decidedly more accurate, and upon the whole it is more accurate. The grim humour of the two last scenes between Bacchus and Pentheus is better brought out. The attempt to naturalise Greek choral metres in English is made with creditable taste and judgment; but the result is tame.

G. A. SIMCOX.

#### PROFESSOR MAURICE.

PROFESSOR MAURICE, who died on Easter-day, had perhaps a more important part than any of his contemporaries, except Dr. Newman, in accomplishing the transformation of religious thought in England, which had been prepared by Coleridge, and foretold in language too pregnant to remain unfulfilled. Looking back on his influence on speculation (which practically came to an end when that of *Essays and Reviews* began), we see that what he really effected was to deprive the traditional orthodoxy of the *prestige* of superior reverence and sanctity, to prepare a piety, what some might call, in his disciples at any rate, a pietism, which would continue to exist fearlessly and helplessly in the presence of criticism until criticism was ready to absorb it in the shape of moral earnestness, and perhaps to retain it in the shape of simple energy. Coming as he did to Anglicanism with the desire to complete what was positive in Unitarianism, he was led to deprive the popular theology of all its elements of resistance, while he retained for himself and his disciples all that conduced to fervour or repose. In many

respects the completest of his works is the *Kingdom of Christ*, which has long been out of print. Here he applied to all the competing systems of the day a single criticism—each rested on a true idea which it destroyed in attempting to express it, while the Church of England, which expressed nothing, embraced them all. There is no real inconsistency between this point of view and his eager championship of the Athanasian symbol; creeds are at once the best foundation and the best substitute for theological science. The antithesis between faith *in* persons and in propositions *about* them is in itself important, but it has little value for dogmatic theology; if propositions *about* the object of faith are impossible *a fortiori* a conscious relation *with* that object must be impossible, any truth to be communicable must pass through the sphere of consciousness before it transcends it. In his *Theological Essays*, Mr. Maurice dealt with the Incarnation, the Atonement, and the doctrine of Future Punishment, and it is by his treatment of these that he exercised most influence and is still best known. His principal addition to the early Alexandrian doctrine of the Incarnation was suggested by his Unitarian antecedents; he pointed out that the benevolent deity of Socinus was rather too like a god of Epicurus. It would be useless to attempt to state his doctrine of the Atonement; so far as it could be stated, it was a repetition of obvious and inadequate solutions; he attempted to escape from their inadequacy by transcendentalising the abstract idea of sacrifice till it became unmeaning. He was more fortunate in pointing out that the idea of eternity transcended mere temporal everlastingness more certainly than it included it; in this way he gained some relief for the sympathies of mankind, though at the expense of the grand conception of a really final consummation of all things, and, while he escaped the deadening comfort of mere universalism, he forfeited the advantage of its immense logical plausibility. His controversy with the late Dean Mansel was a long *ignoratio elenchi*, the more regrettable because the *docta ignorantia* of the *Bampton Lectures* was really the substratum of a homely mysticism which rested Christianity on historical facts corresponding to the permanent needs of man, and had no temptation to buy a respite from historical criticism by translating individual desires into the supposititious intuitions of the human race. This tendency pervades and disfigures Mr. Maurice's numerous Biblical works, for though he was sufficiently influenced by Coleridge to attach himself to the contents of the Bible rather than to the authority of the writers, he carried the impulse no further. This was natural, as in Coleridge himself historical criticism had been secondary to doctrinal mysticism, and so it may be said that Mr. Maurice has completed the work of Coleridge by carrying all his principal suggestions into the sphere of practical edification in which they have borne and are bearing their full fruit.

G. A. SIMCOX.

#### LITERARY NOTES.

The current number of the *British Quarterly Review* contains a very intelligent appreciation of Matthew Arnold's poetry. His relations to Goethe and Wordsworth are well marked. Though he imputes his own method to Wordsworth, it is true that the master took up nature into his own mind, while the disciple escapes from his own mind into nature. It was also worth while to point out that the keynote of his poetry is resistance to the despondency which springs from intemperance and perplexity; and that, except in the *Sick King of Bokhara*, he has seldom, if ever, found a definite positive subject adequate to the mood he wished to express, so that the completeness of his elaborate poetry is purely internal, and cannot be measured by any objective standard. The reviewer commits himself to the opinion that the value of the unrhymed poems is purely rhetorical; as rhetoric he sets them very high.

In Westermann's *Monatshefte*, for February, there are two or three unpublished letters of Schiller's; the first (July 1788), written in a horrible mixture of Italian and German characters, relates to the first representation of *Don Carlos*. Schiller agrees with an anonymous critic that the play is too long for acting, but rather than leave out parts for the stage, he would take it from the stage altogether. The last, undated, is to

Nicolai, who has admired *Tell*, to its author's surprise, as he was formerly a foe to what was called "Kraft- und Original-Genies"; Schiller is grateful for his reviewer's compliments, but begs that another time his title of "Hofrath" may not reappear quite so often.—The same journal contains a series of papers by J. Berger, on Snow Crystals, and the illustrations (in March) of the frost "window-flowers" are very carefully executed.—Freiherr von Maltzan sends the legend of a miraculous spring in Arabia (about 15° N. and 46° E., but no European has visited the spot), in which the natives bathe, and he who wishes for hot water exclaims, "Oh, Mesaud (the name of the presiding Djinn), hot!" and he who wishes for cold says, "Oh, Mesaud, cold!" and to each the water flows as he desires. On enquiry it appeared that the different requests had to be preferred on different sides of the stream, but it was heresy to suppose this condition had anything to do with the marvel. The spring flows from the spot where a serpent disappeared, which had been hatched in the bosom of a poor man (he could not even borrow a hen), from a stone egg which had been sent by some saint in answer to his prayers for help.

In the *Revue des deux Mondes* (April 1) M. Amédée Thierry continues his interesting series of *Recits*, of which the present number is devoted to the Council of Chalcedon.—M. Renan follows his hero de Nogaret down to the destruction of the Templars.

The proprietors of the *Revue des deux Mondes* are going to publish a history of the Review, with notices of its chief contributors, and of their papers, from the correspondence in the editor's office. It would be well if the proprietors of the *Edinburgh* and *Quarterly* would follow the example. It is very useful to know what articles are by Southey, Sir F. Palgrave, &c.

### Art and Archaeology.

**The Marlborough Gems catalogued**, with Descriptions and an Introduction by M. H. Nevil Story-Maskelyne, M.A., F.R.S. London, 1870.

As a careful catalogue compiled with knowledge abreast of the time, Professor Maskelyne's work is a contribution to archaeology which will be valued all the more that ancient engraved gems have been too rarely subjected to serious treatment. Its value in this respect is enhanced by an introduction in which two questions of unusual interest are dealt with, the nature of the stones employed by the Greek and Graeco-Roman engravers, and the growth of the art of gem-engraving in ancient times. Speaking with the authority of a mineralogist by profession, his statements on the former question will be received with just the assurance which was wanting in most previous writers. With regard to his sketch of the features by which successive periods of the art are distinguished, we have found it, short of the complete demonstration which could only be given in a work of large compass, all that could be desired. He ought, perhaps, to have made more of what appears to be both a new and very convenient way of accounting for the almost total absence of gems bearing the stamp of the age of Pheidias, by assuming that the impulse given to the pursuit of ideal beauty by the example of Pheidias was felt only by the great artists of the day, those of weaker calibre, such as gem-engravers, continuing in the meantime the severe careful style in which they had been trained, until a new school arose, with obvious peculiarities and exaggerations easily imitated. In the history of vase-painting we have the same phenomenon, a rigid, minute, elaborate style, uniformly attributed to the age immediately before Pheidias, or more correctly Polygnotos, the great painter, his contemporary, then an apparent blank followed by a style at first severe, but quickly becoming bold and free. Gem-engravers, being,

it is probable, men of higher artistic attainments than vase-painters, were presumably more under the influence of the guiding spirit of their time, and it may have occurred more frequently than we suppose that one or other of them approached the ideal of Pheidias, as in the figure of Sappho on a burnt cornelian, in the British Museum, which for purity of feeling and exquisite workmanship has perhaps no rival among existing gems. There are also a few pastes which suggest, as Prof. Maskelyne observes, the sentiment of the age of Perikles. But straining our limits of the Pheidias style so as to admit the greatest possible number of gems, we have still only a few to set between the hundreds of scarabaei apparently possessing all the characteristics of the previous age and an equal number of splendid gems of the later style. It may certainly be that the immense sacrifices made then by private individuals for the common good and the intense interest of all classes in public affairs withdrew to some extent the patronage of the wealthy from work of this kind. On the other hand, if it can be shown—and it is a notorious fact—that even the metopes of the Parthenon executed under the eyes and direction of Pheidias betray strong marks of the former age, it will be better to assume that, as we descend in the grade of artists, the power was proportionately less of rising to the occasion presented by him. In this case, we must imagine the gem-engravers retaining and working out further the style in which they had been trained. It should also be observed that a taste for elaborate rigid archaic work endured in bas-relief as well as in vase-painting till long after it had passed away as a living style, was revived, if it did not in some measure continue uninterrupted, in the time of Augustus, and retained favour with successive emperors and private patrons. The question, however, does not so much concern the attractiveness of archaic work as the extreme difficulty which ordinary artists must have experienced in seizing the spirit of Pheidias, and of this perhaps no better proof could be advanced than the frieze from the temple of Apollo at Phigaleia, now in the British Museum, the work, it is believed, of Iktinos, the architect of the Parthenon. The perfect freedom in the treatment of the figure and of the drapery which Pheidias introduced is taken full advantage of, but the calm ideal beauty which was his great charm is exchanged for wild movement. And again in the sculptures from the temple of Victory at Athens, executed perhaps in his lifetime and certainly in the presence of his work, it is barely possible to trace his influence. Treasures of gems may yet be found in Greece which will revolutionise our ideas, but in the meantime the facts seem to bear out Prof. Maskelyne's theory.

The Marlborough gems were collected in the course of the seventeenth and eighteenth centuries, before Etruscan tombs had yielded their treasures, and before excavations in Greece had brought to light any important example of the early style of art. They were collected at a time when nothing higher in sculpture was known than the Apollo Belvedere or the Laocoön group, and so it happens that a collection still priceless in the eyes of many is of little consequence in the history of ancient art.

In the otherwise accurate descriptions of the gems we notice a mistake (No. 168) arising from a misunderstanding of the word *Kriophoros*, which was applied to Hermes as a guardian against pestilence, not as a "god of herds." The title appears to have originated in a tradition of his having driven away a pestilence from the town of Tanagra, by carrying a ram on his shoulders round the walls, an event commemorated by a statue of him in the act. As god of herds, he was called *Nomios* or *Epimelios*. It is also a mistake, we think, in the arrangement of mythological sub-

jects, to separate Demeter from Persephone. To the Greek mind they were the inseparable τὸ θεῶν ἢ αἱ δῖονες θεαί.

ALEXANDER S. MURRAY.

### ART NOTES.

The sale of the Persigny collection on April 4 excited great expectations, which resulted in disappointment. The sale took place at the Hôtel Drouot, the two great rival auctioneers M. Escribe and M. Pillet co-operating on the occasion; but the prices obtained were less than moderate. "Departure for the Army," by Terburg, put up at 60,000 francs, was knocked down for 5000 francs; and this appears to have been the highest sum reached for a single picture. The pseudo Raphael went for 2000 francs, and Vanloo's "Portrait of Maria Leckzinska" for 3600 francs; but the English pictures fared even worse. Sir Joshua Reynolds' "Portrait of the Prince of Wales" was knocked down at 3200 francs; his "Portrait of a French Lady," 460 francs, and "Portrait of an English Lady," 500 francs. Gainsborough's "Portrait of a Boy" went for 210 francs. The sum total realised by the sale of sixty-eight pictures was under 53,000 francs.

The unrivalled exhibition of a special class of Turners, in the gallery of the Burlington Fine Arts Club in Savile Row, is prolonged pending the completion of arrangements for a prospective Holbein exhibition by the same society. No pains have been spared, by the amateurs to whose zeal this collection is due, in the effort to make it as complete as possible, and to arrange and catalogue it in the way most serviceable for reference and instruction. Its staple feature consists in a complete series of the *Liber Studiorum*, with each plate exemplified in two or more (and sometimes as many as eight or nine) stages, from the first strongly bitten etching of outlines to the final expression of the mezzotint as dictated by the science or caprice of the master, in toning, filling-in, touching, and retouching. But still more interesting than this central series are the adjuncts which are appended to it, in the shape of some beautiful examples of the unpublished plates designed but not included in the *Liber*; nine original drawings for plates both published and unpublished of the *Liber* class; and two screens full of specimens of a rare and almost priceless order of mezzotints, of which the destination is unknown (as was the existence until after Turner's death), and which bear some resemblance to the *Liber* by their scale and subject, but are printed in black colour instead of brown. Altogether, we have here a unique and inexhaustible field of study, for which the best thanks of all who care for such things are due to the gentlemen by whom it has been contributed and organized.

The direction of the Louvre is about to repossess itself of the gallery on the river side which during the Empire was diverted from the purposes of the museum to those of the Tuileries. The necessary works will be rather costly, so meanwhile the new gallery intended to receive the Byzantine pictures of the Campana collection is being finished. It is situated on the second floor of the wing of the Colonnade. Two new pictures have been hung in the course of the present month. One is said to be a superb Roger van der Weyden, representing the descent from the cross. This fine work was bequeathed to the Louvre last year by M. Mongé Misbach. The other picture, left by M. Jules Vallé in 1870, is "The Denial of Peter," by Lenain.

The museum at Lille is becoming more and more important. Almost every month we have to chronicle fresh acquisitions. Poussin's sketch (oils) for "Le Temps enlevant la Vérité," two fine portraits by van der Helst, and a magnificent portrait of a woman by Franz Hals, have quite recently been acquired for the collection.

An active movement is going on at Bruges in favour of uniting all the scattered art-treasures of the town in one great central collection. If this project takes effect, it will at last become possible to study the works of Lancelot Blondeel, of Pourbus, of the two van Oost, and the numerous unknown treasures which are at present buried in the different municipal establishments, such as the Béguinage, the Pottery, the Bogaerde School, and the Damme Hospital.

M. Léon Cogniet is about to sell all his studies and pictures.

The cases containing the fragments brought from the Temple of Diana at Ephesus have now been deposited in the British Museum, and are in course of unpacking. Amongst the recent acquisitions of the Museum is a head of Alexander the Great (*ronde bosse*), which was unearthed some time since in Sicily. It is a very distinguished piece of work, and appears to be a late (Alexandrian?) reproduction of a contemporary bust.

Mr. Watt's diploma picture of "The Murder of Abel" is unfortunately in too unfinished a state to admit of its appearing on the walls of the Royal Academy exhibition. He will, however, be well represented by several portraits, all good examples of his hand, and by "Daphne" a very refined and finished rendering of a poetical conception. Mr. Leighton contributes a thoroughly successful portrait of the Rt. Hon. Sir Edward Ryan, secretary of the Dilettante Society, in which he has vigorously attacked the difficulties of artificial light, but in which chief attention will be concentrated on the admirably solid and expressive painting of the head. There are yet three pictures by this painter—"A Leader of Condottieri," "After Vespers," essentially a very pretty picture of a lovely girl with eyes full of dreamy exaltation; and "Summer Moon." The last is truly a pictorial poem: two young women have fallen asleep curled against each other; through the circular opening above their heads we see the blue of a southern night. Every sweeping line of drapery, every shade of colour, combine in one lovely harmony. Mr. Millais, besides the pictures by him already mentioned (see *Academy*, vol. iii. p. 107), sends two Scotch landscapes, very brilliant work, but hardly so interesting in subject as the "Chill October" of last year, "A Portrait of the Marchioness of Westminster," and "Portraits of Three Young Ladies playing Whist with Dummy." Some portraits which have been sent in by M. Laugée deserve attention, not only on account of their workmanlike execution, but because his sitters look like ladies, not like women perplexed "by the burden of an honour unto which they were not born." It is pleasant to see among the younger painters evidence of growing interest in the poetical side of their art. Mr. Frank Dacey has taken a motive from the Song of Solomon, "Come, my beloved, and let us go and dwell in the villages." His picture is very carefully worked and thought out, and has much distinction of style. The girl leans back as she stands against her companion, who lifts his hand to gather fruit from the overhanging vine. The sentiment of languorous enjoyment characterizing southern life pervades both figures.

The city of Nottingham has just been selected by the Lords of the Committee of Council on Education as a fitting centre for the establishment of a Permanent Exhibition of Fine and Industrial Art for the Midland Counties, this being the first permanent provincial exhibition in connection with the South Kensington. It will be held provisionally in a suite of rooms in the Exchange Hall, and is to be opened at Whitsuntide, Mr. Cole having been to Nottingham to give the committee his advice as to the arrangement and management. South Kensington will send paintings and other objects of art on loan, and collectors generally are invited to contribute, a call which will doubtless readily be responded to, as the display at the Derby Exhibition in 1870 showed the richness in art-treasures of the Midland Counties.

Dr. Charles Maclean has accepted the appointment of music director and organist at Eton College.

### Contents of the Journals.

*Gazette des Beaux-Arts*.—The present number contains—"Journal de mes Fouilles" (first article), by M. Beulé. The scientific results of these investigations, which date from twenty years back, were made public by M. Beulé, in his work on the Acropolis of Athens. What he now prints are the lively notes in which he chronicled day by day his glimpses of hope and moments of discouragement whilst the excavations were in progress. The first article leaves us in July 1852, at the time when works begun by him at his own private cost had become a matter of public interest, and were taken up by the French

government.—“Curiosités du Musée d'Amsterdam.” This article is a notice, by M. F. de Tal, of Kaiser's valuable reproductions in facsimile of engravings by unknown masters of the fifteenth century.—“Encore un mot à propos du Cenacolo de San Onofrio,” by Émile Maruéjols. M. Maruéjols adduces proofs and arguments in favour of the attribution of this work to Raphael. Passavant peremptorily rejected it, but Passavant was often exceedingly hasty and rash in passing judgment, and the evidence on the other side of the question merits attention.—“Les Palais brûlés” (fourth article), by M. Ed. Fournier.—“La Caricature et l'Imagerie en Europe pendant la Guerre de 1870-1871” (second article), by M. Duranty.—“Les Dessins de Parmesan,” by M. Émile Galichon. This notice is accompanied by various illustrations, one of which, “Femme tenant une victoire à la main,” after a drawing in the collection of M. Galichon, is a very fine example of Parmesan at his best.—The number closes with an article on the destruction of art monuments at Strasburg, by M. E. Muntz.

Bullettino dell' Instituto (February) describes the excavations going on at Capua along the old road that led to Mount Tifata. The tombs were rifled of their bronze urns in Roman times (Sueton. *Jul.* 81), but the pottery (mostly of Greek workmanship) remains.—Henzen gives at length a military diploma, the second part of which has been just discovered, and which slightly rectifies Mommsen's view as to the time of Trajan's holding the Tribunician power—a well-known difficulty in chronology.

Im Neuen Reich (No. 11, 1872) contains an account of the mosaic found at Pesaro, probably of mediæval date, but with the remains of an ancient one below it. An attempt is made to restore the inscriptions on it, and what seem to be a hexameter and pentameter in leonine verse—perhaps of the twelfth century.—A discussion follows as to the position of Germany relatively to the Church question.

### Physical Science.

Contributions to the Parthenogenesis of the Arthropoda. [Beiträge zur Parthenogenesis der Arthropoden. Von C. Th. E. von Siebold. Mit zwei lithographirten Tafeln.] Leipzig: Engelmann, 1871.

IN the year 1856, it will be remembered, Professor von Siebold published his first memoir\* on this phase of animal physiology, when it was shown that for certain butterflies as well as the bees the apparently well-established law of bisexual generation was not true, and that these insects produced a progeny without intercourse. Although this memoir was not the first to treat this important question at great length—a discussion of the question of this mode of generation in Aphides having arisen in the middle of the last century—it caused a great stir among naturalists, and gave rise to a general controversy on the question. Little, however, need be said respecting the history of this question, as there appeared at the time in England an excellent essay by that marvellously fertile author, Mr. G. H. Lewes, in his *Seaside Studies* (second edition, 1860, pp. 296-340), wherein the history of parthenogenesis was written and criticized with great ability and judgment.

In his first work the Munich professor already enumerated some cases of parthenogenesis which he had set aside for further investigation. He now illustrates the method in

which one of the commonest wasps of Southern Europe is propagated, and fully disproves the views of all those who, like the members of the French Academy or the late Professor Schaum, of Berlin, M. Plateau in Belgium, and many others, doubted the correctness of former investigations, more especially of those made on bees.

The wasp which served as an object for the professor's investigation was *Polistes gallica*, an insect of rather common occurrence in South Germany, thereby providing him an excellent example by which to test the accuracy of his views. This, however, was not to be accomplished without great exertion and long sustained observation. Whoever reads the chapter of his book which treats of *Polistes gallica* will be struck with the amount of time, exertion, perseverance, and devotion, which must have been expended in working out the question. We read of extended experiments made and immense numbers of cases most accurately examined, so that the generalisations rest upon the broadest possible bases. In like manner another hymenopterous insect, *Nematus ventricosus*, was studied, and yielded equally important and confirmatory results. Other insects, like *Vespa solsatica*, *Psyche helix*, and *Solenobia triquetrella* and *lichenella*, are more briefly, though not less accurately, considered, and very great care has been bestowed on the following Crustaceans: *Apus cancriformis* and *productus*, *Artemia salina*, *Limnadia Hermannii*, and some *Daphniidae*.

To give a striking instance of the extent of Professor v. Siebold's labours, it may suffice to direct attention to the statistical notes on *Apus*, found on pages 174 and 175. Professor v. Siebold wished to determine the exact number of males among the far more abundant females. He collected *Apus* from twenty-one different localities, the whole number amounting to 13,000 specimens. Among these were found only 319 males! In their selection every specimen had to be examined separately, as the general aspect of male and female is similar, and only a slight difference to be observed at one of the extremities. Professor v. Siebold, moreover, measured each individual of this community in order to test the statement of Professor Kogubowski, who contends that the males are invariably smaller than the females.

To those who have not studied zoology, that branch of science may appear rather dry and uninteresting where to attain scientific results we have merely to count, to measure, and to classify. Though such prejudice is even widely spread, it should not be forgotten that each science and art, to yield results of importance and of wider bearing, has to be pursued laboriously along such dry and uninteresting tracks. The critic, on the other hand, gathers from Professor v. Siebold's labours material whereon to base conclusions of a broader bearing, and finds in the methods in which he conducted his experiments a model for all those who shall be disposed to follow the same lines of biological research.

This element in Professor v. Siebold's book must be especially commended, since it cannot be doubted that the investigation of the habits and life of animals is now cultivated less than it was some fifty and more years ago, and much less than the present state of biological science requires. Mr. Darwin has revived it to a great extent, but through Mr. Darwin also has arisen the necessity for his followers to deal with these studies. It is very gratifying, therefore, to meet with another zoologist, especially a man of Professor v. Siebold's reputation, who continues to cultivate with such special care the investigation of physiological nature, and to blend therewith comparative anatomy, the counterpart of biological research.

\* *Wahre Parthenogenesis bei Schmetterlingen und Bienen.* Ein Beitrag zur Fortpflanzungsgeschichte der Thiere. Von C. Th. E. v. Siebold. Leipzig: Engelmann, 1856.

We find then in this work not only the proofs that parthenogenesis is an established fact amongst many animals, but meet with excellent and highly important anatomical descriptions of the structure of the sexual organs and the formation of the egg in Insects and Crustaceans. As the title of the book does not indicate that it considers these subjects, it may be well to direct attention to these points.

According to Professor v. Siebold's observations there are in the ovary of *Polistes* vitelligenous cells and true ova, and the latter received from the first a considerable amount of vitellus. Each ovary consists of several tubes, each tube of a changing number of egg-compartments. The egg-compartment is composed of several vitelligenous cells and one egg-cell. There is around these an epithelium and a tunica propria, and this tunica propria is in its turn surrounded by peritoneal tissue, muscular fibres, and tracheae, which connect the different portions of the organ to each other and to the peritoneal tissue of the heart. At the other end *the ovary is free, though not in continuation of the oviduct*, their union being only produced by peritoneal tissue.

As regards the formation of the ovum, v. Siebold comes to the following important conclusions: 1. The place where the germ-cells are first developed is the upper part of the ovary-tubes. 2. These germ-cells, differentiated somewhat later into vitelligenous cells and egg-cells, do *not* move further down in the tunica propria of the ovary, but the tunica propria, together with its epithelium, moves by a remarkable process of growth downwards in the peritoneal tissue, enveloping the ovary-tubes, and thus carries its contents with it. The egg-cell and vitelligenous cells, increasing in size, form single egg-compartments, which by and by become surrounded completely by the tunica propria with its epithelium. The latter at last separates the egg, when ripe, completely from the upper part of the ovary-tubes, and becomes changed into the chorion—the vitelline membrane being a product of the egg already in the ovary; the tunica propria surrounding the compartment also separates from the remaining part of the ovary, and eventually detaches the egg also from the vitelligenous cells of the same compartment, their last union being made by a channel which, after separation, is transformed to the micropyle. 3. When the lowest compartment has attained a ripe condition, the egg passes from the peritoneal envelope to the oviduct, freeing itself at the same moment from its connection with the mass of vitelligenous cells hitherto attached to it. 4. The external surface of the egg, which has passed into the oviduct, changes very quickly, in so far as the tunica propria, which still surrounds it, is concerned; it becomes gelatinous, is broken up, and envelops the chorion as a sort of sticky matter. 5. The vitelligenous cells belonging to this egg generally remain at the lower end of the ovary, and undergo a process of degeneration. The tunica propria enclosing them undergoes the same disintegration as that of the egg, whilst the vitelligenous mass, which greatly resembles the corpus luteum of Vertebrates, passes between the peritoneal envelope and the tunica propria of the next egg-compartment, and finally reaches the very top of the ovarian tubes.

We cannot discuss here in any detail the specialities of these processes as described by v. Siebold; we would merely remark that, if v. Siebold's statements be proved by further investigations to be correct—and they are still at variance with the observations of other eminent zoologists—their bearing on general morphological questions will be of very great importance.

Another point of a very striking nature is the way in which the egg in *Apus* is formed. Siebold gives an account of it on pp. 187–193. The ovaries are composed of a great

mass of follicles, each of which opens through a short conduct into a general and broader one, the orifice of which lies close to the eleventh pair of feet. Each follicle is composed of four cells, one egg-cell and three vitelligenous cells. The former thrives, the latter waste away; but, strange to say, the egg is not developed from the elements of one follicle, but by the union of the contents of two or three of them! This union takes place in the general oviduct, and it is here also that a chorion is formed round this yolk-mass, for thus it must be called. The eggs are then extruded and fall to the bottom of the little pond the animal lives in. This example of the formation of an egg from the elements of a great number of cells—not from those representing a single cell, as is usually the case—is most striking. It would be of the highest interest to endeavour to trace similar characteristics among allied forms of Crustaceans.

On pp. 223–238, Professor v. Siebold makes some concluding remarks on the questions treated in his book. He does not discuss the entire relation of parthenogenesis to other modes of propagation, but encourages the hope that light may be thrown on another problem, that of sexual differentiation in the egg—some of the parthenogenetic insects producing males only, others only females. This is undoubtedly one of the most interesting questions in the whole range of biology, and its solution would be of the highest importance in its bearing on many of the ideas and superstitions of common life.

It is, moreover, very desirable that we should be enabled to form a correct idea of advantages or disadvantages attending parthenogenesis as a mode of propagation. Teleology in its old sense having been abandoned by exact science, there are nevertheless abundant reasons for revising teleological investigations in their applications to the Darwinian theory. Each fact in physiology and morphology is capable of an explanation consistent with the theory of natural selection, and this is demanded by modern science. And parthenogenesis, alternate generation, paedogenesis—yea, more than all, the common process of bisexual generation—are as yet vast problems considered from the point of view of the theory of natural selection. It is even highly probable that those who see in parthenogenesis a phenomenon irreconcilable with the views of rational physiology, may yet find that, from the Darwinian point of view, ordinary propagation offers a problem beset with still greater difficulties, and demanding still more profound thought for its complete elucidation. This difficulty presented itself already in his time to a man who was by no means easily puzzled with anything that came within the grasp of his genius—Kant, who, in writing from Königsberg on March 30, 1795, to Schiller, says:—

“So ist mir nämlich die Natureinrichtung: dass alle Besamung in beiden organischen Reichen zwei Geschlechter bedarf, um ihre Art fortzupflanzen, jederzeit als erstaunlich und wie ein Abgrund des Denkens für die menschliche Vernunft aufgefallen, weil man doch die Vorsehung hierbei nicht, als ob sie diese Ordnung gleichsam spielend, der Abwechslung halber, beliebt habe, annehmen wird, sondern Ursache had, zu glauben, dass sie nicht anders möglich sei,—was eine Aussicht in's Unabsehbliche eröffnet, woraus man schlechterdings nichts machen kann, so wenig wie aus dem, was Milton's Engel dem Adam von der Schöpfung erzählt: ‘Männliches Licht entfernter Sonnen vermischt sich mit weiblichem zu unbekannten Endzwecken.’”

ANTON DOHRN.

### Scientific Notes.

#### Geography.

**Arctic Exploration.**—Great things are in preparation for the attack of the unknown region surrounding the North Pole during the coming summer and autumn. From Dr. Petermann we learn that eight continental expeditions are being fitted out, by Austria, Sweden, Norway,

and France. Foremost among these is the Austrian, under the leadership of Lieutenants Weyprecht and Payer. The remarkable results of the trial voyage made by these explorers last season have excited such an interest in the Polar question in Austria, that from the Emperor, the government, and societies downwards, all classes have eagerly contributed towards the fitting out of a more complete expedition. A sum of about 17,500*l.* has already been raised; a screw steam-vessel has been purposely built at Bremen; and everything is in readiness for the start at the end of June. The plan of the voyage is that projected by Lieut. Weyprecht (see *Academy*, vol. iii. p. 71); and the ship is provisioned for three years' absence. It is proposed to spend the first winter off the northmost cape of Asia; to employ the second summer in the exploration of the Central Polar region; and in the third season to penetrate to Behring Strait, and thence to an American or Asiatic harbour. The vessel is of 220 tons burden, with the rig of a three-masted schooner, and has engines of 95 horse-power. Besides the leaders, the expedition will be accompanied by two officers of the marine, named Brosch and Orel, a surgeon, machinist, two chamois-hunters and glaciemen from the Alps, and sixteen picked seamen. Graf Wiltshcek, a warm supporter of the cause, will operate with the expedition for the first season in a vessel provided at his own cost, and will also be accompanied by scientific men. He will also establish a provision depot for the use of the chief expedition on the farthest land of Novaia Zemlia.—Again, an expedition led by Nordenskiöld, under the direction of the Royal Swedish Academy, contemplated since 1861, is to be undertaken this year. Its plan is unfortunately almost identical with that conceived by Parry, and which he proved to be impracticable. It is that of wintering on the northmost islets of Spitzbergen (the Seven Isles), whence by the aid of fifty reindeer an over-ice journey northward will be attempted.—Two Norwegian steamers, navigated by Captains Jensen and Svend Foyn, enterprising whale fishers, will follow the course of the Austrian vessels towards the Siberian seas. Numbers of specially built steam-vessels have this year been added to the Norwegian fishing fleet; and, instructed by Professor Mohn, of Christiania, the masters of these vessels may be expected to add greatly to their meteorological observations of past years.—The latest news of Captain Hall's American expedition is of date September 5, on which day Upernivik, the highest station on the West Greenland coast, was left for the higher north.—Nothing has been heard of the French expedition under Octave Pavy since its departure from San Francisco for Eastern Siberia; but a second French voyage, instigated by M. Ambert, to whom the inheritance of M. Lambert has descended, is about to begin in a vessel from Havre. The objects of this voyage are not only to be geographical and scientific, but "practical results will also be aimed at, such as the taking possession of new lands, whale fishery, and fishery of other sorts."—Rumours are afloat of an English expedition, with which Captain Sherard Osborn's name is connected. Parry's "farthest" is still the most northerly point yet reached on our globe. Let us hope that the honour of surpassing his achievement will belong to one of his countrymen, not to a foreigner.

Of great importance in connection with this subject, and in their bearing on the movements of currents in the Arctic seas, are the examinations of the drift-woods collected according to Dr. Petermann's instructions by the recent German expeditions to East Greenland, Spitzbergen, and the seas east of it. In the hands of well-known German botanists these numerous fragments of wood and bark prove to be chiefly of northern origin; the extreme thinness of the yearly rings in the section of the woods showing that their habitat has been on the outmost limits of tree growth. Larch is the most frequent, and the specimens of it are clearly traceable to Siberia. The pines may either be Asiatic or from Northern Europe. A few pieces examined are however undoubtedly of more southerly origin.

**The Ruins of Zimbaoe in South Africa.**—On September 5, 1871, the South African explorer Carl Mauch visited the ruins of an ancient and mysterious city in the highland between the Zambezi and Limpopo rivers, long known by native report to the Portuguese, and situated in a land which from its gold and ivory has long been identified by some authorities as the Ophir of Scripture. Letters describing the ruins are published in the *Mittheilungen*. Zimbaoe lies in about lat. 20° 14' S. long. 31° 48' E. One portion of the ruins rises upon a granite hill about 400 feet in relative height; the other, separated by a slight valley, lies upon a somewhat raised terrace. From the curved and zigzag form still apparent in the ruined walls which cover the whole of the western declivity of the hill, these have doubtless formed a once impregnable fortress. The whole space is densely overgrown with nettles and bushes, and some great trees have intertwined their roots with the buildings. Without exception the walls, some of which have still a height of 30 feet, are built of cut granite stones, generally of the size of an ordinary brick, but no mortar has been used. The thickness of the walls where they appear above ground is 10 feet, tapering to 7 or 8 feet above. In many places monolith pilasters of 8 to 10 feet in length, ornamented in diamond-shaped lines, stand out of the building. These are generally inches wide and 3 inches in thickness, cut out of a hard and close stone of a greenish-black colour, and having a metallic ring. During the first

hurried visit, Mauch was unable to find any traces of inscription, though carvings of unknown characters are mentioned by the early Portuguese writers. Such however may yet be found, and a clue be thus obtained as to the age of the strange edifice. Zimbaoe is in all probability an ancient factory, raised in very remote antiquity by strangers to the land, to overawe the savage inhabitants of the neighbouring country, and to serve as a depot for the gold and ivory which it affords. No native, mud-hut dwelling tribe could ever have conceived its erection.

**Yellowstone National American Park.**—Following a recommendation made by the Committee on Public Lands, the Congress of the United States has approved an Act by which a large area of country situated in the western territories of Montana and Wyoming is withdrawn from occupancy, settlement, or sale, and is dedicated and set apart for ever as a National Park or pleasure-ground. The region was first surveyed in 1871, by a party under the leadership of Dr. F. V. Hayden, United States geologist, and proved to contain groups of natural curiosities unequalled perhaps in any other portion of the globe. The reserved tract is a square of 55 miles by 65 miles (embracing an area comparable with that of Yorkshire), surrounding the head lakes of the Yellowstone and Madison rivers. Forest-covered spurs of the Rocky Mountains, of from 10,000 to 12,000 feet in elevation, hem the valleys in on every side, and are snow-covered on their summits throughout the year. The whole region has been within comparatively modern geological times the scene of the greatest volcanic activity of North America. Hot springs and geysers (compared with which those of Iceland are insignificant), thickly spread along the margins of the lakes and on the river banks, represent the last stages—the vents or escape-pipes—of these remarkable manifestations of internal force. "All these springs are adorned with decorations more beautiful than art ever conceived, and which have required thousands of years for the cunning hand of nature to form." On issuing from the lake the Yellowstone forms an upper and lower series of falls, and then enters a grand cañon, through which it rushes for upwards of ten miles. The park will be henceforth under the exclusive control of the Secretary of the Interior, who will as soon as practicable make arrangements for the preservation of its wonders, and their retention in their natural condition. The withdrawal of this tract from settlement will be regarded by the entire civilised world as a step of progress and an honour to the American nation.

### Zoology.

**Venomous Fish.**—It is generally known that the wounds inflicted by the weevers (*Trachinus*) of our coasts and by the sting-rays are rendered poisonous by a mucous excretion adhering to the spines of the head, back, and tail of these fishes; and a most perfect poison-organ, analogous to the poison-fang of snakes, was described some years ago by Dr. Günther in two fishes (*Thalassophryne*) from Central America. Dr. Le Juge has found at the Mauritius another still more dangerous kind of venomous fish; it was long known to ichthyologists under the name of *Synancia verrucosa*, and is readily recognised by its monstrous appearance, the head being deeply pitted, and the body scaleless and covered with warts. It is by no means scarce, being found throughout the Indian Ocean, and known at the Mauritius as the "Laffe." There are thirteen spines in the dorsal fin, each provided at its base with a bag containing the poison, and with a pair of deep grooves along which the poison is guided to the wound. As in all the other fishes of this kind, the poison-apparatus is merely a weapon of defence, and comes into action when the fish is seized or trodden upon. The action of fish-poison upon the human organism appears to be less rapid than that of snakes; though patients who neglect to apply remedies similar to those used for snake-bites expose themselves to serious consequences, which may even terminate fatally. In one case a fisherman died on the third day from a severe wound. Dr. Le Juge mentions that the fishermen of Mauritius successfully apply poultices of the leaves of a composite plant, *Microhynchus sarmentosus*. (*Transact. R. Soc. of Arts and Sciences of Mauritius*, 1871.)

**Immigration of some Animals to Mauritius and Reunion.**—Dr. Vinson reports that about five years ago a French ship, *Le Saint Charles*, Captain Leymarie, landed at Reunion a cargo of seedlings of the sugar-cane from Java. A kind of lizard, previously unknown in the island, was observed among the young plants; one of them was caught, while others escaped and scattered themselves about the neighbourhood, where they rapidly increased in numbers, and are at present perfectly naturalised. Dr. Vinson considered it to be the *Calotes versicolor*, which must however be a mistake, as this lizard is not found in Java; it is more probable that it is a species of *Bronchocela*, perhaps *B. cristatella*.—A fine butterfly (*Papilio demoleus*), a native of the east coast of Madagascar and Natal, made its appearance in Mauritius at the commencement of the year 1870, and since that date many specimens have been caught. Another butterfly, *Junonia rhadama*, from Madagascar, has become very common in the same island since the years 1857 or 1858, whilst others, such as *Vanessa cardui*, that were common

thirty or forty years ago, are now becoming more and more scarce. (*Transact. R. Soc. Maurii*, 1871.)

**Fishes of China.**—The twelfth volume of the *Verhandeligen der K. Akademie van Wetenschappen in Amsterdam* contains a very important memoir by the well-known Dutch ichthyologist, Dr. Bleeker, "Sur les Cyprinoides de Chine." The author gives a list of some fifty species belonging to the family of *Cyprinidae* or carp-like fishes, which have been described by his predecessors; and he has been able to add about twenty more to this number, from collections made by the French travellers M. Daubry and the Abbé David on the Yantsekiang, and preserved in the Paris Museum. He expresses a belief that this number, great as it is, barely represents one-half of the Cyprinoids actually inhabiting the fresh waters of the Chinese Empire. The forms resemble rather Japanese and European types than those from tropical parts of Asia; but as our knowledge of the fish fauna of China increases, differences between the northern and southern parts will appear more definite. The memoir is beautifully illustrated by fifteen double plates, apparently representing the specimens of the natural size. The founder of Chinese ichthyology is unquestionably the late Sir John Richardson, who gave very detailed reports on the fishes collected in China by Vice-Admiral Sir Edward Belcher, and by Messrs. Reeves, father and son, the latter having supplemented their collections by a very valuable series of drawings. Their reports were published in the year 1843 or earlier; and it is a remarkable fact that no more recent collections of importance have been brought to England, although the number of English residents and travellers in China has increased greatly since that time.

**The Skin of Rhytina** forms the subject of an interesting treatise by Dr. A. Brandt in No. 7 of vol. xvii. of the *Mémoires de l'Académie imp. des Sciences de St.-Petersbourg*. All hitherto known of the integuments of this extinct boreal Manatee is contained in Steller's account; he described them as rough and furrowed like the bark of a tree, whence the German name "Borkenthier." The truth of what Steller had said is fully confirmed by the discovery of a piece of skin, found by Dr. Brandt amongst corals in a store-room of the St. Petersburg Museum. A more minute examination has convinced the author that the rough appearance is caused by the ravages of a sea-louse (*Cyamus rhytinae*) about an inch in length, which had lived parasitically in vast numbers on the animal's sides. Under normal conditions the skin of the whole body is smooth; this is evident from the circumstance that the skin of the back appears always to retain its smoothness; this part is frequently raised above the surface of the water, and the *Cyami* are unable to thrive when exposed to the air, while they are not unfrequently picked off by sea-birds. Bristle-like hairs are to be found over the entire body. The skin was greatly valued by fur-hunters in Kamtschatka for making a very durable and light sort of boat for crossing from one Aleutian island to another.—Dr. Murie has written some commentary notes on this treatise in *Ann. and Mag. Nat. Hist.* (April 1872). He does not entirely agree with Dr. Brandt as regards the cause of the roughness of the skin, thinking it probable that the skin was normally characterized by innumerable larger and smaller wavy grooves and ridges, and that the parasites could have caused but a limited amount of irritation.

**New Theory of the Rattlesnake.**—It has long been urged as an objection to the theory of natural selection that the tail-appendage of the rattlesnake must be injurious to the animal by attracting to it the notice of its enemies. Professor Shaler has however observed that the noise of the rattle is scarcely distinguishable from the sound made by an American species of Cicada; and he conjectures that the object of the rattle is to attract within reach of the snake the birds which naturally feed upon the Cicada. This he considers to be the explanation of the mode in which birds are seen to flutter round a rattlesnake, without calling into play the unreasonable theory of fascination. A formidable objection to the universality of the principle of natural selection is thus removed. Professor Shaler's paper will be found in the *American Naturalist* for January.

Another species of *Pedicularia*, a genus of Mollusks living parasitically on corals, has been discovered by M. Nobillard; he found it at Mauritius on an *Oculina*. (*Transact. R. Soc. Maurii*, 1871.)

The *Sitzungsberichte der Akademie der Wissenschaften in Wien* for 1871 contain the following zoological papers:—Vol. lxiii.: A Manzoni, "Supplemento alla Fauna dei Bryozoi Mediterranei," first contribution, pp. 73-82, with 3 plates; and J. L. Fitzinger, "A Synopsis of the Species of *Vespertilionidae*," pp. 203-295, and of *Bradyptus*, pp. 331-405.—Vol. lxiv. (July) contains a Synopsis of the species of *Dasyptus*, by the same writer (pp. 209-276).

### Botany.

**The Geographical Distribution of Compositae.**—Mr. G. Bentham read a paper on this subject at two recent meetings of the Linnean Society, in continuation of his paper on the structure of the same order of plants (*Academy*, vol. iii. p. 73). The genera and species of this largest order of flowering plants are about equally distributed between the Old

and New World; of the genera about 410 are found in the former and 430 in the latter; of species, about 4400 in the Old World and a rather larger number in the New. Not quite 70 species are common to the two hemispheres, and these mostly belong to the extreme northern regions; a few are common to New Zealand and Antarctic America; not more than a dozen tropical species are found in both the Old and New World, and some of these are coast plants. The form which Mr. Bentham looks on as prototypic, and possibly ancestral to the whole order, includes a few closely allied genera, distinguished by their regular corolla, belonging rather more to the American than the Old World distribution, being found in Chili, with an outlying genus in St. Helena. Other types, apparently of great antiquity, are found in Africa, Australia, and Western America. Since the separation of the Indo-Malayan and Australian regions from one another, there appears to have been a continuity of races of Compositae across the Tropics from south to north. The paper, which enters exhaustively into the distribution of the various tribes and more important genera, will be published in the *Journal of the Linnean Society*.

**New Parasitic Plant of the Mistletoe Family.**—Professor Asa Gray records in the *American Naturalist* for March the discovery in the State of New York of a new species of *Arceuthobium*, a small kind of mistletoe belonging to the order Lorantheaceae. It was found in two localities parasitic in great abundance on a black spruce; the limbs of the trees affected were very much distorted, every twig bristling with the little parasite; and some trees seem to have died through its absorption of their sap. The curious part of the discovery is that a plant of this sort, growing on the boughs of the spruce trees in such quantity as to distort and even destroy them, and in three adjacent counties of a long and fully settled region, has been hitherto entirely overlooked; and then, when discovered, found about the same time by two independent observers at considerable distance from each other.

**The Uses and Origin of the Arrangements of Leaves in Plants.**—Dr. Chauncey Wright reprints from the *Memoirs of the American Academy* an elaborate and important paper bearing this title. The author's object is to attempt to explain, on the principle of natural selection, the existence of the modes of phyllotaxis most frequently actually found in nature. These consist of two principal general forms; the verticillate and the spiral, of which the latter is by far the most complicated. In the case of the spiral arrangement, the angle of divergence between the two leaves next to one another on the stem is expressed by the general form of the fraction

$$\frac{1}{a + 1} \\ \frac{1}{1 + 1} \\ \frac{1}{1 + 1} \quad \&c. \&c.$$

$a$  being 1, 2, 3, or 4. It is found, however, that certain only of these fractions are met with in the spiral arrangement, while some of those are of much more frequent occurrence than others. An elaborate series of calculations has for its object to show that the particular forms of spiral arrangement actually found in nature are those which possess the greatest advantage for the plant by so arranging the leaves and branches that they have the most perfect distribution, so as not to interfere with one another in drawing nutriment both from the stem of the plant and the surrounding atmosphere.

A letter from Tübingen announces the death of Professor Hugo von Mohl, which occurred on the morning of the 1st of the present month. He was born at Stuttgart on the 8th April, 1805, the youngest of four celebrated brothers; and in 1835 became professor of botany and director of the botanic garden of the university of Tübingen; during the interval he has added greatly to our knowledge of vegetable physiology.

## History.

**The Decline of the Roman Republic.** By George Long. Vol. IV. London: Bell & Daldy. Cambridge: Deighton, Bell, and Co.

THE history of Rome after the Social War is so full of anomalies that we are certain to misconceive it when we try to represent it to ourselves by the help of analogies drawn from a comparatively normal state of things. We cannot resolve the chaos into a struggle between an impoverished populace and a corrupt oligarchy, which found its happiest issue, in the absence of a strong and healthy middle class, through the establishment of a democratic despotism: the empire had its democratic side; but of all the emperors of the first two centuries, Nero was the only demagogue. Augustus, Tiberius, Domitian were conservative to the verge of reaction. The fact is, that after the slaughter of Gaius Gracchus the assembly was practically reduced to the condition of a puppet: it had been proved that the voters could not use their enormous powers so as permanently to better their own condition; and yet those powers were in excess of their capacity, and they retained them unimpaired; and after the restoration under Sulla the senate was a puppet too. Sulla saved the nobility, but he stultified them. It is clear from Cicero's early speeches that out of Rome the men of order were upon the whole on the side of Marius, in spite of his excesses, and that the following of Sulla contained a very large proportion of cosmopolitan adventurers. He filled up the senate with these: and throughout his reorganization of the state favoured the senate, but did nothing for the nobility as such. In fact it did much against them; for the multiplication of quaestorships and praetorships was really a contrivance for pouring a constant stream of "new men" into the senate, for the great families of Rome were not fruitful. Both the senate and the assembly were instruments which might still be used with effect to decide the battle between the real forces of the time. Perhaps it would be hardly too much to say that the proximate cause of the collapse of the republic was that Caesar was confronted by a senate which had all the weakness, all the unpopularity, and none of the strength of a compact oligarchy.

It was this which paralysed Cicero, the only politician of the day who was at once loyal, public-spirited, and intelligent. His career was a series of real humiliations, chequered with pasteboard triumphs, because he neither did nor could observe the late Mr. Cobden's maxim to look at the force behind him as well as the end before him. He was always compromising his personal position for the public good and drawing back to save his personal position when he found he could not serve the public. This is the adequate explanation of his conduct about the Campanian domain; in 56 B.C. Caesar, Pompeius, and Crassus had been drifting apart; Pompeius was discredited, and the populace was inclined to set up Crassus against him. If the senate's *esprit de corps* had been stronger, if it had not been disgracefully weak, it was quite a feasible enterprise to break up the Campanian commission. As two hundred senators attended the congress of Lucca, it was useless for Cicero to press his motion; but it is strange that a historian who expresses so few opinions as Mr. Long should blame him so strongly for making it. Mr. Long seems to write, if I may be pardoned for saying so, too much under the dominion of the common prejudice, that the three confederates were the effective rulers of the Roman empire; it would be as reasonable to say that the empire was governed in the fifth century by the tribes of barbarians who were encamped within it. The confederates had an exceptional position in the state: they could carry most of their measures, but they were liable to occasional defeats; they could not always protect their de-

pendents. Important resolutions like the confiscation of Cyprus were carried through without consulting them; much of the routine of administration went on without their interference. Mere city partisans were as important in politics as ever; as Mr. Long points out, Cicero owed his restoration to the energy of Milo. It is quite possible that, if the senate had been patient, firm, and united—if Cicero had enjoyed the ascendancy of Lord Lyndhurst—the old constitution might have weathered the storms of another half-century, and that the final transformation which now seems inevitable might have been wholly different. Pompeius, who hankered after the monarchy, judged it impossible to reign in spite of the senate and nobility, or to extort their sanction: Caesar, who certainly regarded the senate and the nobility as an incubus upon the Roman world, was far from having determined to seize the monarchy for himself at the time of the congress of Lucca, unless we suppose that he had determined to betray his confederates.

For dealing with so confused a period, there are undeniable advantages in Mr. Long's method of writing history, though every volume renews our surprise and regret that a writer so industrious, so impartial, and so accurate should either not possess, or, possessing, should so completely and so pertinaciously suppress, the other qualities which it is natural to desire in a historian. Still a *précis* of all the evidence, however dry, is sure to bring something to light which writers of more insight leave in the shade. No other history gives quite sufficient prominence to the fact that after the congress of Lucca it was the influence of Caesar far more than of Pompeius which kept the senate quiet; certainly none shows so clearly that the final rupture was due simply to the shortsighted, disloyal selfishness of Pompeius, who drifted himself and forced the senate into a ruinous conflict rather than give up the preposterous pretension of putting Caesar back in a position where he could patronise him.

The chapters on Roman affairs are not the largest part of the volume, but they are the most valuable and suggestive. It is difficult to see what purpose is served by translating all the notices of the Britons and Germans in ancient writers, even to their pragmatical remarks: if there are materials for constructing an intelligible picture of ancient British or German society, the writer should have done much more; if there are not, it was hardly worth while to do so much. Mr. Long adheres to his former opinion that in both his invasions of Britain Caesar landed at Deal; he regards it as an insoluble question whether he sailed from Wissant or Boulogne. He repeats more than once an enquiry, which is surely superfluous, as to where Caesar got his information about what Vercingetorix planned or said: he could question his other prisoners, he could question Vercingetorix, who was doubtless glad to talk. Mr. Long takes the execution of the Gallic leaders from Dion without comment or acknowledgment: he rejects the picturesque and theatrical details of his surrender, which are equally probable, and rest on the same authority. In general he scolds Dion whenever he goes beyond Caesar; he follows him sulkily when he supplements Cicero; it is after all only natural that such a painstaking writer should be irritated by Dion's peculiar kind of cleverness. Much use has been made for the Gallic campaigns of the topographical and other illustrations collected by the author of the *Histoire de César* and others. Mr. Long exercises an independent judgment upon previous writers; but when he follows at all, he follows servilely: writing from the *Histoire de César*, he is led to speak of "the Auvergne;" writing from Hirtius, he is led to speak of Gallic customs in the present tense: the only Gallic name he has ventured to de-Latinise is Cominus, who, after a chapter or two, is cut down to Comin.

G. A. SIMCOX.

**Droit Musulman.** Recueil de Lois concernant les Musulmans Schyites.  
Par A. Querry. Tome premier. Paris : Maisonneuve, 1871.

THE present book is composed mainly for practical purposes. The author, M. Querry, French consul at Tabriz, intends to provide for the wants of European agents residing in Muhammadan, and more specially in Shiite, countries by furnishing them with a complete *Corpus Juris Muslimici*. Speaking of the difficulties which this class of men frequently experience in consequence of their imperfect knowledge of Muhammadan law, he says: "These difficulties are particularly severe when between Europeans and natives there arises one of those differences which according to the treaties must be decided by the tribunals of the country. In Turkey the institution of the mixed tribunals has to some degree diminished these inconveniences; but in Persia there is no court of justice, and, since the matter of dispute is there always referred to the minister of foreign affairs, it happens frequently that the European agent finds it an embarrassing task to discuss or to refute an objection based on the law of the country." It must be stated, however, that there exists already a work which we consider as a reliable guide for our officials in the East in all such emergencies: we mean the compendium of Shia law by N. v. Tornauw. But as it is written in Russian or German, most of them will not be able to use it. In order to fill up this gap in literature, M. Querry has undertaken to translate a standard work on Shia law, without altering anything in its original order and without any omission. For this purpose he has chosen the *Sharâ'i-al-islâm* by Najm-aldîn Ja'far le-Allî Almuḥakkik (who died A. H. 676), the most famous law-book in all Shiite countries. This first volume contains the first half in two books: I. the *Tbâdât*, in ten parts (purification, prayer, poor-rate, &c.); and II. the *Ukûdât*, in nineteen parts (sale, pawn, wills, marriages, &c.). The whole is very well arranged, being distributed in single paragraphs, in order to facilitate reference.

It does not seem to have come to the knowledge of the translator that a considerable portion of this work, the text of which was edited in Calcutta, 1839, has already been translated into a European language; at all events, he does not mention it in the preface. Of the eight books contained in Neil B. E. Baillie's *Digest of Moohummudan Law*, part ii. (see *Academy*, vol. ii. p. 318), the first seven are translated from the same *Sharâ'i-al-islâm*; the books 1, 4, 5, 6, occur already in this tome premier of M. Querry. Mr. Baillie selected those parts which are most important for Anglo-Indian lawyers and judges; he did not translate them in their entirety, but omitted such passages and portions which in his opinion served less the immediate purpose, whilst M. Querry translates the original as it is.

Comparing the two translations with each other, without having the text at hand, we are happy to say that on the whole they agree very closely, and that the one proves the accuracy of the other. Still, there are many differences, on the character of which it would not be possible to pronounce except on the authority of the Arabic text. If, for instance, the paragraphs in the law of marriage 55, 60, and certain passages in paragraphs 37, 38, 57, are wanting in Baillie's *Digest*, we cannot say whether he has omitted them or whether that copy from which M. Querry translated was interpolated. There are, however, differences of greater consequence, in fact, different interpretations of the same words. And nobody who ever tried to disentangle the intricacies of the style of Arabic lawyers will wonder that such things should happen even to men who are so well prepared for their task as Mr. Baillie and M. Querry. We may even go so far as to maintain that in certain cases, in consequence of the ambi-

guity of Arabic forms, it is impossible to find out with complete certainty the meaning of the author. If, for instance, he does not add an interrogative particle, how is one to know whether his words are to be interpreted in a positive or interrogative sense? And on such difference of interpretation the fortune and life of people may depend.

In the chapter of the treaty of marriage, Almuḥakkik says on p. 647: "De même, si, le mandataire s'adressant au père de la femme en ces termes: 'J'ai épousé ta fille au nom d'un tel,' le père répond par *oui*, le mariage est valide." The same words are translated by Baillie (*Digest*, p. 3) in a somewhat different sense: "If one person should say to another, 'Hast thou married thy daughter to such an one?' and the person addressed should answer, 'Yes,' whereupon the husband should reply, 'I have accepted,' there would be a valid marriage."

M. Querry translates on p. 648, § 54: "Au cas, où, de deux personnes, l'une seulement déclarera être unie en mariage à la seconde, qui nie le fait, le mariage sera présumé valide dans les cas à la charge du déclarant, à l'exclusion de celui qui nie l'acte." The same passage is understood by Baillie (p. 5) thus: "If one of them should make such a declaration (that is, should declare to be married to some person who denies it), judgment for all the effects of the contract is to be given against him or her only, to the exclusion of the other."

In the law of wills, on p. 617, § 62, M. Querry translates: "Si le testateur a légué une somme quelconque sans désigner le légataire, le legs sera consacré à des œuvres générales de bienfaisance." This is quite irreconcilable with Mr. Baillie's translation (p. 238): "If a man should make a bequest for several purposes, of which the executor has forgotten one or more, he should dispose of it in some good or proper way."

If a person has bequeathed an undetermined part of his property, one interpretation assigns to the legatee the tenth of the third of the whole property. So, M. Querry (p. 617) quite correctly, because only one third of the property is at the free disposition of the testator; whilst, according to Mr. Baillie, one tenth of the testator's estate is assigned to the legatee. So there is a difference of  $\frac{1}{10}$  and  $\frac{1}{3}$ .

We could give a very long list of similar discrepancies. Not having the original before us, we cannot judge who is right or wrong, but from this comparison it results of necessity that both translations are insufficient guarantees for a conscientious lawyer, if he does not consult the Arabic original in all cases on which the two translators diverge. There is a class of literature which is beyond the limits of the translator's skill, and we are very much inclined to reckon Muhammadan law-books as belonging to this class. They can be commented and transcribed, but at all events many of them, if not all, can never be translated.

The question, therefore, arises how to make a practical handbook of Muhammadan law for all those who want this knowledge, and who cannot study the Arabic originals. We should propose for this purpose to translate as well as possible some accredited text of the law, and to add copious extracts from numerous commentaries of good renown. We ought to adopt the system of the Arabs themselves, whose law-literature is nothing but *one* commentary. Thereby we should obtain two results: First, any lawyer not conversant with Arabic would be able to penetrate into the interpretation of the original as far as any Arabic philologist, European or native. And these commentaries *can*, in fact, be translated, because one helps to elucidate the other. Secondly, the student would become familiar with the Eastern mode of reasoning, with the methods of argumentation of the greatest lawyers of the East. This process may seem somewhat long, troublesome, and expensive, but we maintain that it is the

only one by which it would be possible to provide for all the wants of the most conscientious and scrupulous jurisdiction. The nearest approach to a handbook of this kind is Hamilton's *Hedaya*.  
ED. SACHAU.

### Intelligence, &c.

A new history of Russia, by Professor Bestushev Rumt, has been now published at St. Petersburg (Koshanchikov). The same has published a complete edition of the *Historical Monographies and Researches* of the famous writer and scholar (*in russicis*) Kostomarov, and many translations of great historical works (Motley, Louis Blanc, Tocqueville, &c.).

Altpreussische Monatsschrift, Jan.-Feb.—Lohmeyer shows that the "amberland" of which Pytheas, the early traveller from Marseilles, heard, was probably the Frisian coast and islands, and not the Prussian coast on the Baltic, which the Romans afterwards arrived at by an exploring expedition overland from Carnuntum (close to Vienna).—An account is given of the new MS. (found at Lemberg) of the *Chronicle of Oliva* (close to Danzig), which contains some interesting particulars of the Black Death in Edward III.'s time, the plague which changed the character of the middle ages.—A notice of the German translations of Dante follows.

### Philology.

Cornelli Taciti *Germania*. Erläutert von Dr. H. Schweizer-Sidler. Halle, 1871.

THIS very interesting edition is, as Dr. Schweizer-Sidler informs us in his preface, a forestalment, for the use of schools, of a more comprehensive revision of the *Germania*, intended to form part of a new edition of Orelli's *Tacitus*. Probably no living scholar is better fitted than Dr. Schweizer-Sidler for such a work, which requires a combination of the resources of exact Latin scholarship with those of Indo-Germanic philology and antiquities. The introduction is short, but not so short as to preclude the editor from expressing his inclination to attribute the *Dialogus de Oratoribus* to Tacitus (p. viii). With regard to the *Germania* he is (p. ix) perhaps not quite indulgent enough to the old theory that Tacitus intended it as a mirror in which his countrymen might behold and consider the vices of their own civilisation. It cannot, indeed, be proved that this was the exclusive or even a principal object of the work: but there is considerable internal evidence to show that such an idea was not absent from the historian's mind. As the style of Tacitus savours of poetry and declamatory exercises, so his views of law, politics, and morality, are often not so much those of a statesman as of a member of an embittered literary and philosophical coterie. In common with other eminent writers of his age, he was driven by circumstances to take up, more or less, the attitude of a satirist. Witness such scholastic observations as "aurum et argentum propitiæ an irati di negaverint dubito" (*Germania*, 5); "faenus agitare et in usuras extendere ignotum, ideoque magis servatum quam si vetitum esset" (*ib.* 26). The remark at the end of c. 19,

"plusque ibi boni mores valent quam alibi bonæ leges," gives the tone to much of the disquisition on the social and moral state of the Germans; and the chapters on marriage (19), on slavery (25), on interest (26), and on funerals (27), contain, as our editor himself acknowledges in his notes, much obvious innuendo.

The chief interest of the notes is the constant application to Tacitus' work of the latest results attained in the study of old German history, literature, and antiquities. Since the death of Jacob Grimm, the names of many scholars have been conspicuous in this field, notably those of Zeuss, Wilder, and Müllenhoff, of whose works Dr. Schweizer-Sidler has made considerable use, with great profit and interest to the reader of the *Germania*. Among the most interesting notes may be mentioned that on the homage paid to women by the Germans (c. 8); on the *comites* and the degrees of the *comitatus* (c. 13); on the words expressive of relationship (c. 20); and on the names of the seasons (c. 26). The difficult word *principes*, which Tacitus (not improbably from want of exact knowledge) seems to use vaguely, Dr. Schweizer-Sidler declines to take in so strict and limited a sense as was put upon it by Waitz. The *pagus* he thinks consisted, not of a hundred houses, but of a hundred *gentes*, each consisting of ten houses: see notes on cc. 7 and 12.

Something might, we think, be added to the notes in the way of interpretation and analysis of language. In c. 3, in the passage "sunt illis hæc quoque carmina, quorum relatu . . . accendunt animos," the editor suggests that "hæc" may stand for "illa." But Tacitus, in c. 2, has been speaking of "carmina antiqua," the songs in which the records of the race are enshrined: do not the words "hæc quoque carmina" refer by contrast to this passage? "They have these (martial) songs as well." In c. 7, "unde feminarum ululatus audiri, unde vagitus infantium," we do not see why "audiri" should not stand as historical infinitive, when Virgil, whom Tacitus is so fond of imitating, writes, "hinc exaudiri gemitus iræque leonum" (*Aen.* 7, 15). If emendation be required, "audieris" would be a less violent change than "audias," to which the editor inclines. In c. 13, "hæc dignitas, hæc vires, magno semper electorum iuvenum globo circumdari, in pace decus, in bello praesidium;" and 16, "eosque (specus) multo insuper fimo onerant, suffugium hiemis et receptaculum frugibus," some notice is due to the construction of the cognate accusatives *decus* and *suffugium*, which, if we mistake not, is rare in Latin prose, and in any case requires explanation in a school edition.

We may further notice several poetical, if not strictly Virgilian, expressions scattered up and down the *Germania*, most of which have been overlooked both by Orelli and the present editor. Comp. c. 2, "Mannum, originem gentis," with Virgil, *Aen.* 12, 166, "Aeneas, Romanae stirpis origo;" c. 5, "silvis horrida," with *Aen.* 8, 348; c. 6, "missilia spargunt," with Virgil (copying from Ennius), *Aen.* 7, 687, 8, 695, &c.; c. 14, "bellatorem equum," with Virgil, *Georg.* 2, 145, &c.; c. 20, "robora parentum liberi referunt," with Virgil's "invalidique patrum referunt ieiunia nati," *Georg.* 3, 128 (is *referre* in this sense ante-Virgilian?); c. 29, "limite acto," with "ardens limitem agit ferro," *Aen.* 10, 514; the description of the goddess Herthus, in c. 40 ("invehi populis arbitrantur"), with the description of Cybele, *Aen.* 6, 785, "invehitur curru Phrygiæ turrita per urbes;" c. 44, "velis ministrantur," with "velis ministrat," *Aen.* 6, 302; and the curious periphrasis, "naturam sucini" (= *sucinum*), in c. 45, with Lucretius' "naturam inolentis olivi" (2, 850) = *olivum*.

We conclude with expressing a hope that Dr. Schweizer-Sidler will not confine his efforts to this edition, but will one day devote a work of wider scope to the treatment of the

general connection of the Latin language and antiquities with those of the other branches of the Indo-Germanic family.

H. NETTLESHIP.

*Inscriptiones Hispaniæ Christianæ.* Ed. Aemilius Hübner.  
Berlin: Reimer, 1871.

THIS volume is, as will readily be inferred from its title, a corollary to the second volume of the Berlin *Corpus Inscriptionum*. Professor Hübner has conferred no slight benefit upon the public in proceeding so quickly from the larger to the smaller work. He has felt it his duty, he tells us in his preface, that the editor of the one should be the editor also of the other, and rightly judges that the collection will be a useful one, even though the inscriptions "do not contribute much to the advance of the study of Roman antiquities." This feeling deserves grateful recognition; for he might not unnaturally have set aside these Christian monuments belonging to an obscure branch of mediæval history, as alien from his own studies. In this case we might have had to wait for a long period before any such collection was made, and should hardly at any time have found an editor in whose sagacity in detecting the frauds that beset this subject and in whose complete knowledge of the material we could have reposed equal confidence. It would seem indeed almost impossible that this small volume can contain all the Christian inscriptions of Spain and Portugal up to the tenth or eleventh century, nor are the readings given in every instance incapable of amendment. Incompleteness and uncertainty are in fact defects incident to all such undertakings: but one constructed on a solid workmanlike plan such as the present will in the future only require addition and correction, and can never become obsolete.

Our readers will no doubt be glad to have some general outline of the volume, and some indication of the chief points of interest in it. Both these matters are dealt with clearly and succinctly in the preface, which seems intended, with the index, to supplement the otherwise rather too scanty notes.

The inscriptions follow in general the geographical order of the larger volume, but are not rich enough in number to require more than a division into three parts. The first, Lusitania, is represented by forty-four inscriptions; the second, Baetica, by ninety, while Tarraconensis, Asturia, and Gallæcia have only sixty between them—the northern provinces being very scanty in their yield. Next follow a small number of inscribed tiles, bricks, and rings (*instrumenti domestici inscriptiones*). Then we have the *tituli recentiores* of the ninth and tenth centuries, with a few of the eleventh, and the *falsæ vel suspectæ* in two divisions, according as they claim the earlier or the later date. Lastly come the *indices* in numerous divisions, and a clear and very useful map marking accurately the relative positions of all the places represented in the text. As to this latter part, it is to be noted as a real want that there is no verbal index—a want, too, that very much mars the usefulness of the second volume of the *Corpus*. Without such a help it is often difficult to prove a positive conclusion, and almost impossible, however much we may wish it, to prove a negative. One might have hoped that the recognised utility of his verbal index to the volume edited by Professor Mommsen might have induced Professor Hübner to make these volumes of his own editing equally complete.

As to *matter*, sepulchral inscriptions—which are always the most numerous—here number three quarters of the whole. The rest chiefly record consecration of churches or the presence of certain relics. The few that remain belong in some way or other to church interiors, two only being

upon profane edifices. A few Greek and a few Jewish are scattered through the book. In point of *date* none are earlier than the fourth century, and of the earlier division about half are dated by the Spanish era, calculated to begin 38 B.C. Not only is the significance of this epoch obscure, but the meaning of the word and the way of writing it is disputed. It is stated (Orell. ii. p. 374) to be first found upon Christian inscriptions of the fifth century, and is almost always written *era*, though here we have once *iera* (No. 222, sæc. x), and *aera* is sometimes found (No. 44, aera 548, and in four others of less certain genuineness). The oldest explanation suggested by Isidore (*Orig.* v. 36, 4) is as follows: "Aera singulorum annorum est constituta a Caesare Augusto, quando primum census exegit ac Romanum orbem descripsit. Dicta autem aera eo quod omnis orbis aes reddere professus est reipublicæ." This cannot be right, but the derivation from the plural of *aes*, used as a feminine singular in the sense of "item" and then "element of calculation," had long possession of the field, and is still defended by Wieseler (Herzog, *Encycl. Theol.* word *aera*). Ideler, among others, has accepted the suggestion that connects it with the Gothic *jer*, the German *Jahr*, and our *year*. We should have been glad of Professor Hübner's own opinion on this point, and hope that he will think it worth his while to discuss it in a future number of the *Ephemeris Epigraphica*.

Of the *names* of persons mentioned in these inscriptions we have five classes, viz. ordinary, provincial, Greek, Biblical, and Gothic, &c. Of the provincial names, those peculiar to Spain seem to be *Acisclus*, *Armiger*, *Bracarius*, *Cercuella*, *Cuparius*, *Eburinus*, *Granniola*, *Lilliolus*, *Salvianella*. The first of these—the name of a well-known saint of Corduba—seems to represent the pick of a *fossor* or stone-cutter; the others are not difficult to understand.

The *formulae*, of which we find in the preface a considerable list, do not show very remarkable divergence from those usual in other places. It would have been as well to notice that the phrase *accepta poenitentia* (33, 43, 54) means "having received absolution." It is remarkable amongst other smaller points that the term *requievit* belongs to Lusitania and the adjoining parts of Baetica, while *recessit* is almost confined to the rest of Baetica. The terms *famulus* (or *famula*) *Dei* or *Christi* are common throughout, but almost peculiar to the Peninsula. Of *Scripture quotations* we have only two, the famous words of Job (xix. 25, 26; No. 95), *credo quod Redemptor meus vivet et in novissimo die de terra suscitabit pelem meam et in carne mea videbo Dominum*; and the curious legend upon a gem, *os non cominuetis es eo* (No. 208; John xix. 36, cp. Exod. xii. 46). As to these, it should be remarked that the first agrees very little either with the old Latin or the Vulgate, though more like the latter. A similar epitaph is found in the cloisters of S. Paolo fuori le mura at Rome, which, like this, reads *Credo and Dominum* for the first and last words, but otherwise follows the Vulgate. The latter is the text of the Vulgate, where the old version has *confringetis* [in eo is a misprint for *es* or *ex eo*, præf. p. x]. To the formula of prayer, *ut pro tuo promisso et sublidamine* (i.e. sublevamine) *mereamur ingredi paradisi ianue* (No. 96), should have been added the versicles, on a paten (*Auctarium*, p. 120, No. 230), which should, of course, be supplemented as below—

*Da pacem Domine in diebus nostris quia non est alius qui pugnet pro nobis nisi tu Deus noster*].

The *sepulchral poetry* is, as far as metre goes, worse even than the pagan of a late date. We have here some of the earliest known instances of rhymed or Leonine verse, the first of a certain date really rhymed being No. 123, aera 680, A.D. 642, though not mentioned in the preface. The first four lines will show the average character of the metre, which

here as elsewhere disregards accent only more rarely than quantity :

*Haec cavē saxā—Oppilāni cōtinent mēmbra  
Clāro nībre natāliūm — gestū abīlque conspīcūm  
O'pibz quīppe pōllens—et ārtuūm vīribz cīlens  
Iācula vchī pīcipitū—pīdēbque Baccels destīnātū.*

So far it is possible to make a sort of accented verse, on the principle that no word may have more than *one* accent, or metrical ictus. But what can we make out of the following,

*In pīocīnctūm bellī necatur—opītulatione sodalīum desolatū—?*

We must only notice a few more points raised in the preface before proposing for consideration a few emendations in the text. The *grammatical* results which accrue from these inscriptions are not very striking. They certainly prove (as the editor remarks, p. xii) the non-existence of any supposed peculiar Spanish Latinity. There are traces even of a better orthography than might have been expected. Nevertheless, besides the ordinary depravations common at an earlier date, there are rather numerous instances of the palatal pronunciation, which according to Isidore may have begun first in Spain, and to which modern Spanish tongues are particularly adapted. Such are *baptidiatus*, *iudigsium*, *Sciprianus*, *septuazinta*, *sussitabit*, *Zacob*.

The number of unusual grammatical forms is not large. To those noticed in the preface and index we should add *annibz*, No. 139. The term *numero* = "in large numbers" was perhaps also worthy of remark, No. 140—

*hic sunt reliquiae numero Sanclorum (n. n.) et aliorum numero Sanclorum.*

In the appendix of *recentiores*—which appear to be separated on no very definite principle from the earlier ones—the form *Kal. Magii for Maii* (No. 258, aera 1077) might have been noticed. What, again, is *prilula* (No. 213, date A.D. 1000) in the line—

*Piscator obiit prilula feritus—?*

The following observations, amongst others, have occurred to me on a careful reading of the *text* of this volume. No. 125 (at Corduba), which Prof. Hübner finds obscure in parts, loses most of its difficulty if written out into the following incondite and incomplete hexameters:—

✠

*Crux veneranda hominum redemptio semper,  
In qua Christus pendens homines redemit cunctos;  
Teque ingestantes possident caelum.  
Nunc melius gaudemus Christi morte redempti,  
Dum caelum et paradysum Sina accipit homo.*

*Teque ingestantes* receives light from No. 268 ✠, *crucis alme fero signu; fugie demon. era* (M) LXXXV VIII [here 1089 is a misprint for 1099]. *Paradysum Sina* would almost seem to be a confusion in the writer's mind for *Sion*.

No. 126 is a list of relics of saints in St. Peter's Church, also at Corduba. First come the names of the five martyrs referred to by Prudentius as the glory of that city, in his well-known hymn (περὶ στεφάνων, 4, *de martyribus Caesar-augustanis*)—

*Corduba Acisclum dabit et Zoellum  
Tresque coronas—*

the three being Faustus, Januarius, and Martialis. Then follow three uncertain lines. In these the letters RITA and CTT appear to be readable. Instead of CARITATIS in the first, which is, I believe, unknown as the name of a saint, I would suggest *Leocritiae*, and in the second *Perfecti*—

both *Leocritia* and *Perfectus* being recognised as martyrs at Corduba, the first on March 15th, the second April 18th.

In connection with this, I would take No. 175 from Acci (*Guadix*), near the head of the Guadalquivir, as Corduba is about halfway down its course. Here, in deciphering a similar inscription, Prof. Hübner has not shown his usual acumen. He is puzzled by the name *Sti Babile*, though *St. Babylas*, Bishop of Antioch, will be familiar to all readers of St. Chrysostom, while others will remember that the scene which took place at the removal of his bones from the precinct of Apollo at Daphnae, at the order of the Emperor Julian, was no small element in the dissension between him and the excitable inhabitants of that city (Amm. Marc. xxii. 12, 13; Soz. *H. E.* v. 19, &c.). In the next column of the same (l. 7, 8), we should certainly read *F[austi Janu]ari et Martialis*, the "tres coronae" of Prudentius, and almost as certainly in the next line, *septe]m dormientes in E[pheso]*, instead of the queer . . . *m dormiente sine e . . .*, though the change from genitive to accusative is a curious but not unexampled solecism (cp. the first lines of the epitaph of *Oppila* quoted above, No. 123). The next names are, of course, *Gervasi et Protas[i]* (not *Servasi . . te*, &c.), the martyrs of Milan, unknown indeed in themselves, but famous for the miracles wrought at their translation by St. Ambrose—remarkable indeed as some of the best attested of ecclesiastical miracles (see, for instance, S. Aug. *Conf.* ix. 7). In their case, we may remark, as well as in that of St. Babylas, it was the translation which brought their relics into repute. In the next line but one we should probably supply *Scor Ferre[oli]*. The space will not admit of more than one name; and we know that two Ferreoli were honoured in the neighbouring province of Gaul, one at Vesuntio on June 16th, the other as patron of Vienne, whose rather striking "passio" may be read in Ruinart, ed. Ratisbon. p. 489 sq.

In No. 142 the sense might be restored by a better punctuation. I should propose to write—

*Haec tenet urna tuum venerand(um) corpus Vincenti, abb(at)is,  
Set tua(m) sacra(m) tenet anima(m) caeleste sacerdos  
Regnum, mutasti in melius cum gaudia vile,*

instead of making *caeleste sacerdos* a vocative. And in the next line—

*Martiris exempla signat quod membra sacrata  
Demonstrante Deo vatis hic reperit index,*

instead of *signant*—*A* being the monogram for *at*, and *NT* as in *demonstrante* for *ant*. *Exempla* is probably for *exemplar*, final *r* being not uncommonly lost in late Latin, as in *Marma* in the *Carmen Arvale* of the third century, *mate, pate, Alexande, soro, uxso*, &c. (Schuchardt, *Vok. d. Vulg.-Lat.* ii. p. 390. I do not quote *Maio, Mino, censento, rogato*, from early Latin, as these seem rather to indicate a loss of final *s*.) The meaning is very obscure, but seems to be, "The poet's finger, after finding the sacred limbs by God's guidance, marks (by these lines) the martyr's example"—*signat* being used somewhat in the sense which it is in Virgil with regard to Caieta's burial-place,

*Et nunc servat honos sedem tuus, ossaque nomen  
Hesperia in magna, si qua est ea gloria, signat.*

A little lower down we may punctuate—

*Sic simul officium finis vitamque removit,  
Spiritus adveniens Domini quo tempore Sanctus  
In regionem piam vexit animamque locabit.*

This part of the inscription seems to be an epitaph of the finder of the relics, apparently a priest of the church, whose bones are perhaps joined with those of St. Vincent in the next line, as efficacious in freeing from purgatorial fires—

*Omnibus hiis mox est de flammis tollere flammās.*

In the ring, No. 204, I would suggest ΚΙΡΙΩ, as the interpretation of the curious monogram apparently on the seal or gem; cp. No. 149, l. 10—

*Hic valas Kirio sacrata ut allaria Christo.*

In the later series, in No. 219 (an epitaph of Abbot Samson, aera 928), a note is wanted on the lines, which I would thus arrange—

*Cuius in urna manent hac sacra membra, inaula  
Personat esperio illius fame fota.*

Here *inaula*, which the MS. copy rightly writes as one word, *ināla*, is a superfluous compound, meaning "nave of a church," just like *inatrium* for *atrium*, *incurtis* for *curtis* ("court"), *indammum*, &c., though I am not aware that *inaula* is elsewhere found.

The curious poetical touch, such as not rarely shines out in the midst of many a very commonplace epitaph, seems to mean, "Though he here lies buried, the church still rings with the doctrine of his native (*Esperio* = *Hispanico*?) eloquence." A similar touch is found in the earlier and more metrical epitaph No. 165—

*Hunc cause mserum—hunc querunt vota dolentum  
quos aluit semper voce manu lacrimis.*

In No. 239, in the monastery of St. Stephen *de Riba de Sil*, a few miles from Orense, is a very barbarous epitaph to a bishop who had turned monk, which thus begins—

*En quem cernis cavea saxa—teget compago sacra  
Presul Isauri—per omnia inlustrissimi viri.*

*Cavea saxa* is merely a modified form, of no particular gender, of *cava saxa* (No. 123), or *saxea cava* (No. 130), signifying a sarcophagus; and *compago sacra* appears to do duty for an accusative, as we might say, "the sacred frame;" but *Presul Isauri* should surely be *Presulis Auri*, or *Aurie*, i.e. Bishop of Orense; for the line below—

*Sinens cathedra predicta—agglutinans se norma monastica*

shows that the name of his see has been mentioned. *Auria* is the mediaeval Latin name of Orense, the *Amphilochia* of Strabo, and the *Aquae Calidae Cilinorum* of Ptolemy. Curiously enough, no notice of this place is taken under any of these names in Dr. Smith's *Dictionary of Ancient Geography*, and it would seem not to have occurred to Prof. Hübner.

These remarks will show that there is still something to be done for the text. Our space will not allow us to give any extended criticism of their historical data. English readers familiar with Mr. Foulkes' recent essays will be interested in two inscriptions connected with the name of Reccared. The first is from Toletum (*Toledo*), No. 155:—

† *In nomine dni consecra | ta ecclesia scte Marie | in catolico die pridie | idus Aprilis anno feli | citer primo regni dni | nostri gloriosissimi Fl(avii) | Reccaredi regis era DCXXV [A.D. 587].*

It is worth while to observe the date of the consecration and the position of this church. We must, no doubt, consider *die pridie* a pleonasm, as it occurs not unfrequently, e.g. Nos. 45, 120, 121, &c., and in *catolico* will then designate the Catholic as opposed to the Arian quarter. As to the date, Reccared began to reign in the preceding year 586, and immediately proceeded to make vigorous profession of the faith for which his brother Hermenegild had been a martyr (see Milman, *Lat. Christ.* bk. iii. ch. vii.). The famous third synod of Toledo, in which Spain generally became Catholic, did not indeed take place till 589; but Gregory of Tours has preserved the memory of an earlier synod held in this very year 587, at which the king declared his personal conviction, grounded particularly on the fact that miracles were worked by the Catholics and not by the Arians (*Hist. Franc.* ix. 15; Hefele, *Councils*, § 286). An event like this, probably taking place also at Toledo, would

be a natural occasion for such an effort as the dedication of a new cathedral. A similar inscription from Granada records the consecration of three churches, the last of which runs thus—

*Item consecrata est ecclesia sci Vincentii | Martyris Valentin(i) a sco  
Lilliolo Accitano pontife | XI Kal. Feb. an. VIII gl. dni Reccaredi regis er.  
DCXXXII [A.D. 594].*

*Hec sca tria tabernacula in gloriam Trinitatis [indivise] cohoperantibus  
scis aedificata sunt ab inl. Gudiliu[va?...] | cum operarios vernolos et  
sumptu proprio.*

This is another not uninteresting evidence of the impetus given to the Catholic party under Reccared's rule. The word *indivise* (or *indivise*?), which Prof. Hübner has failed to conjecture, seems clearly suggested by the broken letters of his facsimile—a proof, if any were wanted, of the usefulness of such aids.

We must now take leave of this interesting volume. We cannot help hoping that in a future edition a verbal index will be added, and that some one learned in Spanish church history will take the trouble to collect whatever still remains unedited, and to add illustrations such as a detailed study of the martyrologies and histories of councils would abundantly supply.

JOHN WORDSWORTH.

**The Funeral Inscriptions of Attica.** [Ἀττικῆς ἐπιγραφῶν  
ἐπιτάφιοι ἐκδιδομεναι ὑπὸ Στεφάνου Ἀθ. Κουμανουδῆ.] Athens:  
1871.

PROFESSOR KUMANUDES has long been known as one of the most active and accurate of Athenian archæologists. The present work cannot be more suitably praised than by placing it in the same rank with Professor Michaelis' recent work, *Der Parthenon*, as a model of clear and compact arrangement of a large mass of material. Boeckh's *Corpus Inscr. Graec.* contained hardly 500 Attic funeral inscriptions, and very few of these had been seen by Boeckh himself: the present work contains nearly 4000, a large proportion of them (those marked by an asterisk) being edited from the personal examination of the writer. An introduction is prefixed, which, besides being a treatise on Athenian sepulchral monuments, contains also an explanation of the editor's aim and method. He tells us that in printing all the inscriptions in cursive Greek only his purpose is to render the book as inexpensive and accessible as may be. He considers no uncial text short of an actual facsimile of the stone to be worth the additional expenditure of space and of trouble: he urges the wider employment of facsimiles, which are of the highest importance, in works of a more sumptuous character, and for a different class of readers. One cannot but sympathise with this view; and yet the orthography of the old Attic alphabet can scarcely be represented without uncials: *τυχέν* (= *TYXEN* = *τυχεῖν*), *ἀνέπ* (= *ANEP* = *ἀνέπ*) are novelties to which the eye does not easily become reconciled. Moreover, uncial copies are useful in representing mis-spellings and other mistakes of the sculptor; and it is surely possible, as the work of MM. Le Bas and Waddington especially shows (*Voyage archéologique*), to employ such a variety of uncial type as shall fairly represent to the reader the successive changes and local peculiarities of Greek palaeography.

The number of inscriptions discovered of late years in Attica (to look no wider) is enormous, and it will take time to bring them all together in a new *Corpus*. As a contribution to that end, Prof. Kumanudes puts forth this collection of all known Attic funeral inscriptions. He arranges them in nine classes: (1) Epitaphs of soldiers slain in battle, and honoured with a public funeral; (2) Epitaphs

of Attic demesmen, arranged in the alphabetical order of the demes, and within each deme in the alphabetical order of the names of the dead; (3) Epitaphs of *ιστορεῖς*; (4) Boundary-marks (*ὄροι*) of tombs; (5) Epitaphs of foreigners resident in Attica; and (6) of persons whose nationality is not discoverable; (7) Metrical epitaphs wherein an injury to the monument has effaced the name of the dead; (8) Christian epitaphs, which curiously enough never mention the nationality of the departed, possibly in view of a heavenly citizenship; (9) Fragments; to which are added all the Latin funeral inscriptions as yet discovered in Attica, and their number is strikingly few as compared with other parts of the Graeco-Roman world. The editor's Prolegomena are very interesting. His remarks on the orthography, punctuation, and especially on the restoration of Greek inscriptions, are thoroughly sound: so are those on the present state of archaeology in Greece. It is gratifying to find a Greek telling his countrymen some home-truths, and confessing that even Lord Elgin's dismantling of the Parthenon has but been the means of multiplying a hundred-fold the lovers of Greek antiquities. The most valuable portion of the Prolegomena is an account of the various kinds of Attic tombstones—*στῆλαι*, slabs, pillars, &c. This is too full to be more than referred to here: enough to state that Prof. Kumanudes has made a valuable addition to what had already been done for this subject by Baron Stackelberg's splendid work (*Die Gräber der Hellenen*, Berlin, 1837); by Friedländer (*De Operibus anaglyphis in monumentis sepulchralibus Graecis*, Regium Bov. 1847); and by Pervanoglu's useful treatise (*Die Grabsteine der alten Griechen*, Leipzig, 1863).

Passing to the body of the work, we find that to each inscription is prefixed (wherever possible) a notice of the shape of the monument, of the kind of marble composing it, the place where it was discovered, the works in which the inscription has been published, its probable date, and the place where the monument at present may be found. Beyond these references there is but little in the way of commentary, excepting occasional foot-notes on matters of importance. Thus on p. 243 is a note confirming the opinion that the frequent occurrence of the graves of Milesians in Attica affords no ground for supposing a Milesian deme. The editor remarks of this class (1) that he scarcely finds 20 that are anterior to the Roman period; (2) that the epitaphs of females are far more numerous than of males (144 to 96); (3) that these monuments are found not only in the vicinity of Athens, but also in various more distant demes.

This general absence of commentary would be possible only in the case of funeral inscriptions, which present few occasions for individual remark: and the general conclusions which the editor has gathered from his extensive study of this class of monuments have been thrown by him into the Prolegomena. Such are his remarks (p. 17) on the disputed meaning of the vase often sculptured on Attic tombstones: we are gratified to find him establishing conclusively that this symbol does imply that the person buried below died unmarried. In a note on p. 18 he states that the common formulas *χρηστός* (*χρηστής*), *χαῖρε*, or *χρηστὲ χαῖρε*, are never found upon the graves of any Attic demesmen; and that even on those of strangers buried in Attica the expression (elsewhere so common) *χρηστὲ (χρηστή) καὶ ἄλκιε* (or *φιλόστοργε*) *χαῖρε*, never once occurs. On p. 17 various mis-statements are corrected respecting the manner in which the wives and daughters of Attic citizens are designated upon tombs; and again (p. 18) he demurs to the hasty opinions which have been ventured respecting the banquet-scenes so often represented in relief upon Greek funeral monuments. We are glad to see a

severe stricture upon M. Lenormant (pp. 48 and 99) recalled in the appendix (p. 446).

The type and paper are such as appear to be usual in Athenian publications, but they are scarcely worthy of the book. The printing is usually correct, but in No. 9, l. 2, the omission of the word *φίλην* spoils the hexameter. The alphabetical arrangement employed throughout renders reference easy: two useful indices, however, are appended, one of matters worthy of remark, the other of geographical names. Of the 174 demes (the number given by Strabo), 127 are here to be found mentioned; of the 47 which remain, at least 23 are known to us from other inscriptions or from ancient authors (p. 458). E. L. HICKS.

Demosthenes de Corona: with English Notes. By the Rev. Arthur Holmes, M.A. Rivingtons, 1871.

THIS edition of the masterpiece of Demosthenes reflects credit on the editor of the *Catena Classicorum*, and will be very useful to students, for whom a good commentary on the oration, within a reasonable compass, has long been wanted; in spite of the somewhat exaggerated compliments paid by Mr. Holmes to his predecessors. The plan of the book is good, embracing so much prefatory history as is necessary for the comprehension of the speech, with a clear and vigorous review of its general character, and notes long enough, as a rule, to make the orator's meaning clear without embarrassing the student by undue prolixity.

Mr. Holmes has a genuine admiration both for the character and the oratory of his author. Upholding the perfect honesty of his policy, he even defends him from the common charge of deviation from truth in the course of this speech, maintaining that it would have been absurd in Demosthenes to attempt to deceive his audience by palpable falsehoods. His theory is that both the antagonists, to suit the critical and artificial taste of their audience, had recourse to quibbles, but not to absolute falsehoods: Aeschines raking up clauses of laws practically if not actually obsolete; and Demosthenes answering him by quoting equally obsolete clauses of exceptions and exemptions. His occasional bad taste and coarseness Mr. Holmes very fairly attributes to the general decadence of the age, rendering it necessary that he should in some degree accommodate his style to the low calibre of the Athenian courts of justice.

The notes do not profess to deal with varieties of reading, except where they materially affect the sense of any passage; but such exceptions might with advantage have been a little multiplied. An instance of this is found in the well-known passage where Demosthenes protests against the general virulence and unfairness of Aeschines' proceedings (§§ 12-16): on which, however, Mr. Holmes' comment is on the whole deserving of the highest praise. He grasps its meaning, thoroughly explains the somewhat complicated connection, and translates vigorously and correctly; but in the last clause of § 13 he entirely ignores the variety of punctuation, *ἐπεὶ δ' εἴπερ ἐξελέγξεν ἐνόμιζεν, αὐτὸν οὐκ ἂν ἐγράψατο*, which, though probably wrong, is adopted by Dissen, and is the more worth noting as it entirely changes the meaning of a very difficult passage. On § 65 he is again silent as to a probable error of Dissen's, in defending the very weak interpolation of *οὐκ*, which Mr. Holmes says is supported by no editor but Reiske. In § 220 he adopts the reading *χώραν*, in spite of its acknowledged difficulty, without any mention either of the alternation *ᾠραν*, found in several MSS., or of Schäfer's conjecture, *ᾠραν*, which is supported by Dissen. In § 221 the reading *μηδὲν παραλείπων* might with advantage have been noticed; and in § 228 we miss all allusion to the old reading *ὑμᾶς ὑπάρχειν ἐγνωσμένους*,

which is found in almost all the MSS., though necessitating an unparalleled interpretation of ἐγνωσμένους.

In the explanatory notes some similar omissions are noticeable. In § 28 the expression ἐν τοῖν δυοῖν ὀβολοῖν is explained at almost unnecessary length, but no clue is given as to what is much more difficult to understand—the exact meaning of the clause in which it stands, and whether it is to be attributed to Demosthenes or his opponent; whether it expresses the insignificance of the whole question, or raises a supposed objection that Demosthenes was crippling the revenues of the state, by depriving it of the two obols which these ambassadors would each have paid for entrance. In § 130, οὐδὲ γὰρ ὦν ἔτυχεν ἦν, though rightly explained, is a sufficiently remarkable attraction to call for grammatical analysis. So in § 135, the genitive absolute, referring to the direct object of a transitive verb, seems worthy of a note; and in § 262 Schäfer is somewhat misrepresented as misinterpreting the passage, since his explanation, that Aeschines was thrashed for robbing orchards, really rests upon a different reading, which Mr. Holmes ignores, ὥσπερ ὀπωρώνης ἐκείνος ἐκ τῶν ἀλλοτρίων χωρίων; which entirely changes the force of the allusion. There are also several technical words on which a word or two of explanation would have been of use, such as χρηματίζειν, ἔτη καὶ νέα, βακτηρία, σύμβολον, while, considering the important bearing of the subject on the speech, a somewhat fuller account of the whole system of the trierarchy could not have been considered out of place.

Of actual mistakes very few instances have been detected. We cannot but think that in § 198 Mr. Holmes has missed the meaning of ἐνεδοκιμῆν, which may be compared with ἐνεδαίμονῃσαι and ἐντελευτῇσαι in Thuc. ii. 44; so that it should be rendered not “as regards reputation,” but “the man by whom the misfortunes of Athens were set apart as a field wherein to gain glory for himself.” In § 219 ἀναφορὰν is probably not “something to fall back upon,” but “room for throwing the blame on some one else.” And this would have been apparent from the parallel quoted by Mr. Holmes himself from Aeschines, had he given it in its integrity. In § 259 there seems no reason to suppose that νεβρίζων contains any idea of Aeschines’ wearing the fawn-skin himself, as that was a dignity (see below, § 265) to which he had scarcely attained. And on § 195 Mr. Holmes assigns no reason for rejecting Schäfer’s very adequate interpretation of ἃ γε μὴδὲ πείραν ἔδωκε, whereby ἃγε is made the subject: “Quae nec usum sui dederunt.” These, however, are but pardonable blots in a really good edition of the speech, and we may look with satisfaction on the other hand not only to a careful digest of previous commentaries, but to several new and valuable suggestions; such as that in γέρρα ἐνέπιμπρασαν in § 169 we may see a burning of the hurdles that fenced in the ordinary space for the popular assembly, as the speediest method of preparing for a monster meeting. It is also right to draw attention to the careful analysis of the meaning of the various particles throughout the speech.

J. R. KING.

**Maachberoth Ithiel**, by Jehudah ben Shelomoh Alcharizi. Edited from the MS. in the Bodleian Library, by Thomas Chenery, M.A. Williams and Norgate.

**Y’HUDAH EL-HARIZI** was the last of that splendid galaxy of Hebrew poets in Spain to which Gabirol, Y’hudah ha-Levy, and the two ben Ezras also belonged. He was the author of an imitation of the Maqâmat of el-Hariri, under the title of Tahk’moni, and previously to this of a Hebrew translation of the same work. Any one who has the slightest knowledge of *Hariri* in the original, or even of Rückert’s masterly German adaptation, will appreciate the difficulties encountered

by him in this translation. Professor Chenery, of Oxford, observes with great justice in the preface (p. ix):—

“The contest is not a fair one. The Hebrew language cannot rival the Arabic in the latter’s own dominion. That high-flown metaphorical diction, which has become so associated with Arabic composition that it does not offend even European scholars, educated to a more severe taste, surprises rather than gratifies when it is attempted in the language of the Bible. As a literary feat Alcharizi’s composition in this book is marvellous.”

The late Silvestre de Sacy, in his edition of *Hariri*, passed a high eulogium on *Harizi*’s translation, and published one of the chapters as a specimen. Only three other chapters have been published since his time. The present editor presents us with the twenty-seven Maqâmat contained in the Bodleian MS., in which, however, the commencement of the first is wanting. The MS. is written in rather careless Yemen characters, and is in many places pale and defective. Probably few scholars but Prof. Chenery, whose translation of the first part of the Maqâmat is well-known to Arabic students, would have attempted the delicate task of deciphering it. It is certainly not an easy piece of Hebrew composition. The poetical passages, and the abundant synonyms, may cause perplexity to the ordinary student, especially as the text is only pointed in a very few cases. Foot-notes, at least in the most difficult passages, would not have been out of place.

There are two prefaces, an English and a Hebrew. In the former, the editor gives a sketch of *Harizi*’s life and works, with references to the biographical authorities. In the latter, which is really a fine piece of style, an attempt is made to fix the period when Jewish writers adopted the Arabic metres. There is one passage in it (see p. 11) which sounds like an echo from the times of *Harizi*, where the editor chastises in severe terms “the rich men” (Jews?) of England, whose only aim is material pleasure, and who completely neglect a literature which cannot enrich them. May it not be a *vox clamantis in deserto*!

AD. NEUBAUER.

### Intelligence.

The notices of lectures to be given at the university of Strasburg in the term beginning on May 1 include one by Professor Max Müller, of Oxford, who “will be so kind as to lecture in the summer semester on the ‘Results of Comparative Philology.’” MM. E. Reuss and Heitz, of Strasburg, and Laqueur, of Lyons, have also consented to lecture, as well as some professors of the former Faculté de Médecine. Fifteen hundred students are said to have already inscribed their names.

The German Philological Congress is announced to take place at Leipzig at the latter end of May.

The Russian *Journal of Public Instruction* (*Journal Ministerstva Narodnago Prosvetshchenia*) is now publishing a critical study on Persius’ *Satires*, with the Latin text, a Russian translation, and a very complete commentary.

## General Literature.

## GOETHE AND HIS MOTHER.

W. Goethe. *Les Œuvres expliquées par la Vie. 1749-1795.* Par A. Mézières. Didier et C<sup>e</sup>, 1872.

Frau Rath. *Briefwechsel von Katharina Elisabeth Goethe.* Von Robert Keil. F. A. Brockhaus, 1871.

It cannot be said that either of these recent contributions to the mass of Goethe literature adds materially to our knowledge of the poet or his surroundings. M. Mézières' book is pleasant to read, clearly conceived, lucidly expressed, and touches with intelligent sympathy upon a variety of points which possess an inexhaustible interest for the students of Goethe's writings. But the main idea of the work, so far from being new, is one which English and German biographers have worn, if anything, rather too threadbare, and it would have been more original to collect the purely imaginary characters and episodes in Goethe's poems than to arrange once more his life and writings in parallel columns with the familiar passage from *Wahrheit und Dichtung* as a motto. The other publication is tantalizing in a different way; the writer has some valuable new matter to communicate, and there was useful work cut out for an editor in collecting and arranging all that had already been published in scattered and inaccessible periodicals, &c. relating to or from the hand of the most *genialisch* of women. Unfortunately Herr Keil has trusted to the inherent interest of his subject and to the fact that he had some new letters from and to Frau Goethe to communicate; and he has simply not edited the book at all. He has reprinted some of the letters which were already known, but not all; he has printed new ones without giving an account of how they came into his possession, though he must have been aware of the importance of an authentic pedigree for the MS. letters, since he denounces those published by Bettina Brentano as in the main presumable forgeries; and, finally, he has not been enabled to give his work the completeness which it is certainly time for it to receive, if ever, by incorporating all the letters of his heroine which are known to exist, as, for instance, her very interesting correspondence with Lavater.

About Goethe's childhood and youth, Margaret and the *Mitschuldigen*, Aennchen and *Die Launen der Verliebten*, M. Mézières does not attempt to say anything new, for the simple reason that there is nothing to be said. The Sesenheim episode—the desertion of Friederika and the reflection of Goethe's self-reproach in the picture of Marie and Weislingen in *Götz von Berlichingen*—naturally introduces his judgment on the degree of blame which attaches to the poet who so often "loved and rode away," and on what is called Goethe's egotism in general. M. Mézières compares the stoicism with which he closed his heart against Friederika's tears to that with which he compelled himself to ascend the

spire of Strasburg Cathedral and to witness surgical operations. "S'il paraît quelquefois très-dur pour ceux qui se sont attachés à lui, il a commencé par être plus dur encore pour lui-même." This side of his character is not exactly hard to understand, and yet it is almost a psychological paradox that, after going out of his way to suffer acute nervous pain of one kind in order to deaden his acutely painful sensibility, he should yet be able at once and without practice to face the immediate moral suffering of a separation from Friederika, when he had but to be faithful to her to secure the quiet mind which he started by preferring to the ease and comfort of the moment. In fact Goethe's stoical conduct was the logical consequence of his Epicurean tastes. He would bear pain for the sake of learning not to mind it, or in order to escape the danger of it at a future time; Kästner wrote of him a little later: "He has strong affections, but great command over them;" and it is by the strength of his affections only that the degree of his self-command is measured when that self-command is alleged as a proof of his coldness of heart. M. Mézières, who, like most of his biographers, has rather a *tendre* for Friederika, does not excuse his treatment of her, but he thinks a prophetic instinct made her lover choose rather to be true to his real and stable self, to the Goethe of the Memoirs, than to any of the charming girls towards whom, as has often been pointed out, the Goethe of the Memoirs is really as cold as the youth of Frankfort and Strasburg tried to be. The story of the real and the ideal Lotte is pleasingly told, and the artistic merits of *Werther* as a romance appreciatively set forth: it is also plausibly suggested that as much of the relations between Albert and Lotte as is unjust to Kästner may be borrowed from Goethe's experience of another *ménage*, that of Maximiliane de la Roche (Bettina's mother) and Brentano, in which he also played the dangerous part of supernumerary in a matrimonial duet.

In explaining his works from his life there is a certain temptation to give undue prominence to the works which can over those which cannot be so explained; and it may be thought that M. Mézières dwells in consequence too long upon both Clavijo and Stella; the former from the autobiographical point of view is only a replica of Weislingen with another Marie very like the first, but the poet seems to be more nearly reconciled to himself, as he allows Carlos to make out a very strong case in favour of prudential selfishness. In *Stella*, where Mr. Lewes failed to discover any biographical element, M. Mézières detects an exposition of the drawbacks to marriage in the abstract suggested by the author's proposed marriage with Fräulein Schönemann (Lili). Again, unlike Mr. Lewes, he believes Lili to have been the object of a serious passion, and all the more on that account is he obliged to magnify Goethe's reluctance to make a final sacrifice of his liberty. He treats the extremely accommodating principles of all the ladies in the play and some of their remarks, which are unmotivated, if not actually out of character, as expressing or illustrating the writer's own view that constancy was a virtue—in women. But taken in connection with the poet's actual personal experience, there is another view possible. The husband in *Stella* is the same as Weislingen and Clavijo, only his desertion takes place after marriage instead of before, and the piece may almost be read as a justification of Goethe and his other heroes for refusing to put themselves in a position where the temptation to a worse offence than their own might have become irresistible. In *Iphigenia* and *Tasso*, M. Mézières tries, but without much success, to recognise the portraiture of Frau von Stein, the ruling influence in Goethe's life when they were commenced. In the latter work alone something of Goethe's surroundings may be

traced; the court of Weimar has lent some of its features to that of Ferrara, but Goethe's relationship to it at a time when he writes calmly to his mother that the best proof of his contentment with his situation is that he cannot even imagine one for which he would exchange it, is very unlike that of his melancholic hero; and though Frau von Stein was obdurate, she was not, like Eleonora, on a pinnacle of earthly greatness beyond his reach. Of course just then Goethe and Tasso made love in similar language, and before his flight into Italy Goethe was in a depressed, agitated mood which could be idealised into something befitting real misfortunes, but something more than this is meant in the cases where his works are manifestly "parts of a long confession," and if *Torquato Tasso* in any sense represents the emotions of the first Weimar period, it is not Goethe's love for Frau von Stein, but his love and longing for Italy, for art, for more light and harmony in his self-consciousness, that are shadowed forth in his hero's sighs.

M. Mézières very wisely declines to enter into unprofitable speculations as to what would have been the effect on Goethe's writings if he had not gone to Weimar, but the natural order of his book calls attention to the comparative cessation of the productive impulse before the Italian journey, and to its altered direction immediately afterwards, both of which facts it would have been within his province to explain; the rather that his conception of Goethe's character does not exclude a regret—the only regret possible in the face of his colossal achievements—that the fixed convictions and principles of art which he brought back from Italy had not been reached before the wild inspired madness of the young man "Goethe or the Devil" had burnt away half its strength. *Wilhelm Meister* and *Faust*, in which the two Goethes are most nearly one, do not come into the present volume, a sacrifice in some ways to chronological method, for their biographical interest is of course connected with the date when separate passages were composed, not when the complete work was published. Amongst the poems inspired by Christiane Vulpius, M. Mézières omits to mention *Der neue Pausias*, a graceful tribute to her original profession; and he is perhaps rather inclined to over-estimate the depth of the passion with which she inspired Goethe, for the unusual tone of sincerity and *abandon* in the poems of this date may be explained as showing, not that the feeling to be expressed was stronger than before, but that the poet was no longer afraid of being mastered by it if he admitted its strength. Of the subsequent marriage, M. Mézières, who is always on the side of morality, simply says, "Il aurait mieux fait de commencer par là."

The Frau Râthin, Goethe's mother—Frau Aja, as her correspondents prefer to call her—occupied a larger space in the German literary world than is generally recognised. She was not merely the mother of her son, she was the woman who explained to his admirers how such a man could come into being; her house is the place of pilgrimage—*Casa Santa* is its regular name in the letters—for all that is illustrious, by birth or intelligence, throughout Germany. No man, woman, or child has ever left her presence with a discontented face; and many a celebrity who had been gradually repelled from the more exacting personality of the son remained through life on a footing of filial friendship and devotion to the mother. The writing-desk which she clears out once a month, and never without laughing, is "like heaven, all class distinctions are done away with in it; high and low, the pious and publicans and sinners, all form one heap. The good Lavater's letter lies quite peaceably by the actor Grossmann's, and so on." She has a certain round table, of which the fame seems to show that she neglected none of the material aids to social success;

and her phrase, the "tyrant's blood," for the good Rhenish vintages shed for her guests, met with a wide acceptance equally flattering to her invention and its subject. She seems to have possessed at once and by nature the Olympian serenity of mind which Wolfgang only conquered after many struggles and conflicts, in which, perhaps, just the tenderest bloom was knocked off his moral sensibility. Both were resolved to make whatever sacrifices were necessary to keep their minds clear and their imaginations untroubled by ugly visions, but Frau Aja somehow never found it necessary to sacrifice anything that even looked like a duty to a friend to this paramount duty to herself. The characteristic trait noticed by Mr. Lewes, that her servants were forbidden to tell her bad news, even if it were true, for she was sure to hear of it soon enough, is remarkable as the exact opposite of the animal curiosity which develops into the *Schadenfreude* of (generally feminine) gossips; and the remarks that follow on the danger of *coddling* the mind are a degree further from being applicable to the mother than to the son; there was a degree less of conscious effort in her conduct, though the object kept in view by both was identical, viz. to avoid mental suffering as a simply unprofitable distraction.

There are many signs in the correspondence that Frau Aja's intellectual gifts were held in as high esteem as her unalterable good humour. The Grand-duchess Amalia of Weimar writes with a packet of journals published "for private circulation" during a summer holiday:—"The authors are Hätschelhans" (the name generally given to Wolfgang in the confidential letters), "Wieland, Herder, Knebel, Seckendorff, and Einsiedel. Frau Râthin's world-renowned connoisseurship will easily enable her to identify the author of each piece." And Wieland (who, like Merck and all who had been admitted within the charmed circle of intimacy at *Casa Santa*, addresses Frau Aja as an adopted son), besides asking her opinion on his own works, entrusts her with a delicate editorial commission. Klinger, one of the *Sturm und Drang* brotherhood (of whom Wieland asks, "Is it better with the youth, or does he still swill lion's blood?"), offers to send a tragical tale for insertion in the *Mercur*, of which Wieland is editor, who, anxious not to incur the odium of rejecting the work, begs his correspondent to look at it first and tell him if it is good for nothing, that he may make an excuse to the author if so. Besides all tributes from without, and besides the fact that a sufficiently comprehensive culture is required in order to appreciate *all* Goethe's writings, as we cannot doubt his mother did; her own letters, heedlessly composed and spelt pretty much as Providence pleased, would of themselves go a long way to explain the dictum of Duke George of Mecklenburg: "It has never surprised me that such a woman should give birth to a Goethe."

The letters are generally short, homely in style and language, and absolutely free from literary pretensions:—"What does the woman want with me?" she exclaims, when Madame de Staël is in Frankfurt; "I have never written an A-B-C-book in my life, and my good genius will preserve me from doing so in future." And yet Goethe himself could not be more sublimely superior to the chatter of the clever Frenchwoman: "I felt as if I had a millstone round my neck." "It was all very nice so long as they would let me stay away." Even her denunciations of wit are amusing: "Wit, wit! it always reminds me of a draught; it's cooling, but it gives one a stiff neck." Is this Frau Aja or George Eliot? Unfortunately none of Frau Goethe's letters to Wieland seem to have been preserved, but one is not inclined to quarrel with the editor for having nevertheless printed as many of the answers as he could procure; they are amusing in themselves, and they help to complete our

idea of the person addressed. Some letters from and to the Grand-duchess Amalia are new, and they help to establish still more firmly the strange and edifying truth, that all through the relations between the grand-ducal family and the house of Goethe, the former never ceased to feel themselves the party obliged and benefited. Of course it is lucky for the ghost of Karl August that this was so; posterity would have torn him limb from limb if he had failed in any one particular of the respect due to the genius that deigned to harbour at his court; but the fame of a Maecenas is always so modest that one has to be careful not to under-rate the merits of the duke. M. Mézières expatiates very judiciously on all that his character gained under the influence of intercourse with his illustrious mentor; but the fact remains that he chose Goethe for his friend in defiance of all Weimar when a boy of eighteen, a conclusive proof that it was not from Goethe he acquired the gift for which Goethe praised him fifty years later, "of discerning men's talents and characters, and assigning his right place to each." One or two of his letters to Frau Rath are printed in this volume, downright and rugged in tone, but thoroughly affectionate. Two very interesting letters from Goethe himself refer to their visit to Frankfort, just before the *genius-journey* to Switzerland in 1779. He gives his mother the minutest instructions for her domestic preparations; the attendants and servants are to have mattress-beds, but for the duke and Goethe only a *Strohsack* each; no lustrus in the duke's room, he would laugh at them; four courses, neither more nor less, for dinner; and so on. The letters of Frau Rath to her grandchildren, to Friedrich von Stein, the boy whom Goethe almost adopted, and to her friend Unzelmann the actor, have been already published in different places, but there are four rhyming epistles to Fräulein von Göchhausen, for the sake of which all the editor's sins of omission and commission may be forgiven him. The writer declares:—

"Aber als mich meine Mutter gebar,  
Kein Poetengestirn am Himmel war;"

but all the pieces show a remarkable facility of composition, and on p. 231 there are some lines—if we had space to quote them—that have a maternal likeness to some of Mephistopheles' tirades.

If the collection of Frau Goethe's letters had been complete, we should have earnestly recommended the work to the consideration of translators, though it must be admitted that the language of the free-spoken Frankfort dame might present some difficulties; the English, for instance, for *Potschickermant* has still to be invented. H. LAWRENNY.

**Dante's Divine Comedy.** [*Dante's Göttliche Komödie nach Inhalt und Gedankengang übersichtlich dargestellt.* Mit biographischer Einleitung. Von Dr. Rudolf Pfeiderer.] Stuttgart: 1871.

THE object of this book, like that of Miss Rossetti's *Shadow of Dante*, reviewed in the *Academy* of December 15, 1871 (vol. ii. p. 551), is to give educated persons a more accurate knowledge of the *Divine Comedy*, and thus to extend its popularity, and increase the number of its readers. The difference between the two mainly arises from their being intended for different classes of persons, Miss Rossetti's being rather suited to beginners, while that of Dr. Pfeiderer presupposes a knowledge of, and interest in, many of the questions which arise from a study of the poem, and aims at establishing certain views of his own. Thus, while the method of both is nearly the same—to give a brief life of the poet, general prefatory remarks to the whole poem, and an analysis of its three sections, with special introductions to each—the English volume is the more readily intelligible,

owing to its simplicity and the useful diagrams that accompany it, and the German, on the other hand, is far fuller and more exhaustive. Both introduce numerous quotations from the poem itself, for which purpose, as Miss Rossetti has made use of the translations of Mr. W. M. Rossetti and Mr. Longfellow, so Dr. Pfeiderer has availed himself of that of Streckfuss, and in one or two passages of those of Schlegel and Philalethes (the king of Saxony). The first of these, which is in rhyme, is admirably suited for the purpose from its spirit and vigour; and its weak point, that it is in imperfect *tersa rima*, is less noticed in isolated passages: a complete reproduction of the rhyme of the original has not yet been accomplished in German, as it has in English by Mr. Cayley and Mr. Ford, though we are glad to see that such a translation, from the pen of Herr Notter, is in course of publication.

In his sketch of Dante's life, the writer has excellently pointed out what distinguishes Dante from all other great poets: the combination in his person of the character of idealist and artist with that of practical man of the world. Had he not been the sweet singer of the *Vita Nuova*, absorbed in his romantic love for Beatrice Portinari, and at the same time the Florentine patriot, deeply involved in all the struggles of his country, the *Divine Comedy* could never have been produced, or, at least, would have wanted that universality and that union of the real and the ideal in which its greatness largely consists. And, in like manner, his relation to his age is a twofold one, which only a man of the highest genius could occupy; that age itself wearing a twofold aspect, checkered with strange contrasts of light and darkness, marked by examples of extraordinary piety and extravagant crime, and, in the midst of profound ignorance and wild confusion, producing vigorous growths in art and literature, and developing the germs of political organization. In the midst of these discordant elements we see the figure of Dante, "facing, like a Janus, at once backwards and forwards." The representative of his time, in all its beliefs and conceptions of things, he is at the same time the prophet of the coming age. He is a sincere and orthodox Catholic, but, not the less, half a reformer. His political views are both limited by and pass far beyond the circumstances which surround him. Like the seers of the Old Testament, he finds in the present the means of embodying and representing laws of permanent application.

Towards the end of the volume, Dr. Pfeiderer has given an excellent *résumé* of the various views that have been taken of the purpose and meaning of Dante's great poem—a survey from which we may learn how immense has been its influence on the intellectual life of succeeding generations. With the earlier interpreters the moral and theological aspect is almost exclusively predominant, even to the ignoring of the literal meaning. In later times another one-sided mode of interpretation has also sprung up in Italy, and for the most part found its home there, according to which the political side of the poem assumes overwhelming importance. It is in Germany, during the last half-century, that a less exclusive and more qualified view has arisen, admitting at once three elements, the personal, the moral, and the political; though here again two schools are to be found, according as the greater prominence among these is assigned to the moral and religious significance—on which side are to be found the great names of Witte and Philalethes—or to the political, which is ably represented by Wegele. Our author claims to be himself the first to place the three in a co-ordinate position, and to put clearly forth the unity of purpose in the poem, by finding a common point in which the three may be combined. This is the person of Dante; so that the poem is to be regarded as the mirror of his

experience in life and thought ; and its outline, in particular, represents the history of his sin, his conversion, and the mode of his renewal. But beyond this he sees in himself human nature personified, and finds in his own struggles the representation of their struggles, and in his own progress towards salvation the way which they also have to follow ; thus excluding the didactic tendency, which is essentially unpoetical. In the first instance, it is the men of his time of whom he stands forth as the embodiment ; and thus the politico-historical side of the poem is introduced, explaining the means of their temporal renovation ; afterwards, in a still wider application, it is mankind at large, whose eternal restitution is to be brought about in the same way as his own was ; and the consideration of this involves in its universal aspect the moral and theological significance of the story. Therefore it is that he relates his vision for the instruction of men, in accordance with the injunction laid upon him by his forefather Cacciaguida in the *Paradiso* (canto xvii.)—

“ Rimossa ogni menzogna,  
Tutta tua vision fa manifesta,  
E lascia pur grattar dov'è la rogna ;  
Che, se la voce tua sarà molesta  
Nel primo gusto, vital nutrimento  
Lascerà poi quando sarà digesta.”

In this way the poem in every sense deserves the appellation of “The Soul's Epic.” At the same time, in the course of its development, we must expect to find that now one, now another, of these meanings will take the most prominent position, and not unfrequently one will overlie the other : it is from the latter of these results that the manifold application of certain passages arises.

This view of the *Divine Comedy*, Dr. Pfeiderer proceeds to apply to that most difficult subject, the allegory which it embodies. In this likewise he finds a corresponding three-fold character. Thus, in interpreting the *Selva*, he applies it, first, to Dante's own youthful errors ; next, to the sinfulness of mankind ; finally, to the confusion of his own time, arising from political aberrations and false relations of Church and State. Similarly, when he defines the position of Dante's two guides, Virgil and Beatrice, these characters are made to represent respectively—first, his favourite poet and master in the poetic art, and his first love, the thought of whom had led him to heavenly things : secondly, reason and revelation—Virgil being described as saying of his own function (*Purg.* xviii.), “quanto ragion qui vede, dirti poss'io ;” while some things which are attributed to Beatrice, especially the circumstances of her appearance in the Terrestrial Paradise, are not less than blasphemous, if she is to be regarded as a mere woman, however glorified : thirdly, the temporal institutions necessary to human welfare, and especially the Empire—Virgil, as the author of the *Aeneid*, being the poet of the origin of the Roman empire, and consequently being constantly represented in the *Inferno* as laying special stress on offences against the state ; and, the primary means of man's eternal welfare, divine grace, quickening the soul. Now in estimating this and every other view of the allegory in Dante, we ought always to bear in mind two things—on the one hand, that from the character of the poet's mind, and from what we find in his prose writings, we have reason to expect every kind of refinement of meaning in his poem ; to which it should be added that in his epistle dedicatory to the *Paradiso*, addressed to Can Grande della Scala, he expressly attributes to the poem a moral and allegorical meaning : on the other hand, that it is easy to find a recondite meaning where there is none, and to engraft theories of our own on Dante's writings. In the present case, making all allowance for the former of these, we cannot help feeling that Dr. Pfeiderer, notwithstanding the completeness of his scheme, has erred too much on the side of ingenuity in assigning to Virgil a political

character ; in fact, in one place (p. 179) he seems somewhat to be sensible of the difficulty of it, because he is forced to include under the temporal institutions of which Virgil is the representative, the outward and visible functions of the Church, which he has not mentioned elsewhere. Still, we think that in this portion of his work, as well as elsewhere, Dr. Pfeiderer has done good service to the study of Dante ; and we regret that he has not given us his views on the intricate allegory of the exceedingly difficult 32nd canto of the *Purgatorio*, which, strange to say, has been passed over entirely unnoticed.

H. F. TOZER.

Varnhagen von Ense's Biographische Portraits. Leipzig :  
Brockhaus.

LUDMILLA ASSING, opening once more the inexhaustible Pandora box in which her late uncle's manuscripts are contained, has presented us with a new series of biographical essays written by Herr Varnhagen at different periods of his life. For students of a certain phase of North German literature and society, the representatives of which were attracted by Rahel's sentimental *esprit* and her husband's birth and position, the opinions and troubles of Thoreff, the great physician or quack as the reader may take it, and of Caroline von Fouqué, the wife of the author of *Undine*, and herself a popular novelist, may be of some importance. The only portrait of general interest, however, which the volume contains is that of Clemens Brentano, one of the leaders, and, as far as mere poetical power is concerned, decidedly the most gifted representative of the romantic movement in Germany. The material afforded in the sketch of his professorial character, and several of his letters addressed to Rahel, is the more valuable, as our sources for the knowledge of his character and literary career have hitherto been so extremely scanty. Besides the contrast between the characters of the diplomatic man of the world and the eccentric poet, as it became soon but too evident when they met at Toplitz in 1811, and which is still recognisable in every line of Varnhagen's account, is highly amusing and equally characteristic of both parties concerned. Varnhagen, in his capacity as literary amateur, had seen enough of the “Sturm and Drang” of contemporary poets not to be shocked by a moderate amount of extravagance and quaintness of manner. Still the childish braggadocio and sometimes heartless vein of freak and foul-mouthed gossip, which in Brentano subsist together with the most high-minded enthusiasm for the beautiful, were quite a puzzle to the experienced diplomatist. After relating a particularly unpleasant trick played him by the poet, our author adds in despair : “I observed this sudden transmutation with amazement, and began to see what an unsafe customer I had to deal with.” This same whimsicality, systematized and thoroughly affected as it was in most cases, contained at the same time the fatal germ of destruction for the noblest aspirations of Brentano's life and works. Occasionally it intruded even into the sanctissimum of his catholic mysticism, the sincerity of which it displays in a rather dubious light. Varnhagen relates the following amusing anecdote :—Brentano's sister Bettina discovered in a picture of St. Peter, which he pretended was drawn by himself exactly after the vision of the well-known stigmatized “Nun of Dutmar,” an old tobacco-pouch, which was connected with various jokes of former times, and which now served as a wallet to the saint. When he found himself discovered, the poet heartily joined in the merriment of his sister. This fickleness of character, although not impairing our admiration for his genius, must have made personal intercourse with the poet a matter of extreme difficulty. Once Varnhagen was obliged to resort to personal chastisement, which had at once the desired

effect; the poet replying to this severe treatment with great meekness: "You will be my best friend, like Görres, who has also boxed my ears." The letters to Rahel form a sort of commentary to Varnhagen's sketch, and are quite in the character of their writer, a mixture of sensual religious mysticism and childish silliness, interrupted by passages full of deep poetical beauty, and a kind of melancholy humour to be met with only in the works of German romantic poets, and which might be expected from the creator of Ponce de Leon and the "schöne Annerl." F. HÜFFER.

### NOTES ON LITERATURE AND ART.

The controversy respecting the Polish or German extraction of Copernicus seems to be very nearly decided, in an anonymous and temperate pamphlet on the former side of the question, reviewed in the *Allgemeine Zeitung* for April 5. As the name of a village in Upper Silesia in the thirteenth century, and as a family name at the present day, Copernik, sometimes spelt Kopernik, Kopernak, Kopiernicki, is not infrequently met with, and referred etymologically to the Slavonic Kopr, Koper, *anethum graveolens* with the common termination *ik*. It was always known that the astronomer's father resided at Cracow before moving to Thorn, and the evidence, all presumptive, in favour of his having been a German immigrant counts for very little against the un-Teutonic sound of his name. His wife, Barbara Watzelrode, it is admitted, was of German parentage, and the only point still undecided is whether Barbara's mother was of the same stock as her husband, since otherwise a trifling advantage would rest with the Polish patriots.

J. Frohschammer writes to the *Allgemeine Zeitung* (April 8) on "Philosophy and Darwinism," objecting to the latter its want of a sound speculative foundation and its compatibility with the common theory of creation, and hinting at the superiority of the abstruser German philosophy with its promise of a transcendental Pantheism.

The German papers have been commenting on the supposed inaccuracy of a statement relating to the manuscript of Humboldt's *Kosmos* which appeared in a French publication; such a MS. had been presented by Professor Buschmann to the King of Prussia for the Royal Library at Berlin, with a very dutiful letter; and it was not generally known that the second MS., a fair copy, with the last corrections of the great author, had also been presented by the same person to Napoleon III. (with a still more dutiful letter, explaining that Humboldt's "heart was ever French"), and accordingly is still to be found at the National Library of Paris. Humboldt wrote in the Italian hand, and with lines that slanted so much from left to right that, to keep them straight, as he grew older, he gradually shortened them almost to a single word, so that each page of the white quarto paper on which he wrote was divided into a number of slender columns.

In an article by W. Lang in a recent number of *Im Neuen Reich*, on "Danteliteratur in Deutschland," it is remarked that notwithstanding the numerous contributions to the subject, and especially the translations of the poem which are constantly appearing in Germany, the *Divine Comedy* is not, nor is likely to be, a popular book in that country. Dante holds a very different position in respect of German culture from Homer and Shakespeare. This, the writer remarks, is not wonderful, because of the antiquarian research required to understand the poem, and the need of the reader's throwing himself into a point of view essentially different from his own. It is also suggested that the multiplicity of ideas and interests which Virgil and Beatrice represent detracts from their reality, and causes us to follow their guidance with less confidence. The fact that modern Italians have found no difficulty in making Dante their great political poet, notwithstanding the apparently anti-national tendency of his views, is explained by pointing out that the circumstance of the princes, who would preside over the empire in Dante's scheme, being German is a mere accident to him; he only regards them as Roman; and though they have their

relation and their duties to the whole world, yet the care of Italy is their especial function.

M. Didier has just brought together in one volume the articles on Prudhon which M. Charles Clément has contributed at different times to the *Gazette des Beaux-Arts*. The work has been fully completed by the author, and is accompanied by thirty fine engravings, reproducing the painter's most capital works, several rare etchings by him, and some of his principal drawings. M. Charles Clément is continuing his study of modern French painters; and the *Gazette* will publish in its next number the commencement of an important work on Léopold Robert. M. Clément was the intimate friend of the late Aurèle Robert, and has had the opportunity of acquiring from him much private and valuable information concerning the life of his brother Léopold.

The portrait of M. Thiers, on which Mlle. Jacquemart has been for some months past engaged, will be exhibited at the coming Salon.

M. Émile Vernier was entrusted by M. Corot, some time back, with the task of reproducing several of his paintings, in a set of lithographs published by M. Marion, the director of the *Librairie artistique*. These are now exhausted, and M. Vernier has just completed a second and more important series, in which will figure "Le Matin," "Le Soir," "Sodome," "Le Marais," "Le Berger," "La Toilette." The new issue will thus represent the genius of Corot in each of its various forms.

The Archaeological Congress of France will be held this year at Vendôme, and will commence June 18. A statue of Ronsard will be inaugurated during the sitting of the congress. A retrospective exhibition of the art-work of the Vendômois is in course of organization, and will be opened at the same time.

The Italian papers announce an open competition for a statue in white marble representing Joseph Mazzini in proportions somewhat larger than life. This statue is intended to replace the bust which was deposited at the Capitol on the 17th March, 1872. The competition will close on the 18th June this year. Designs are to be sent to 81, Via della Croce, Roma.

Three terracottas, once in the Praun'sche collection at Nürnberg, and now the property of Professor Hähnel, of Dresden, have been offered for purchase to the British Museum. They are said to be from the hand of Michelangelo. The sum asked is 3000*l*. The subjects are Morning, Day, and Night. It is not possible to speak positively as to their merits or authenticity from a brief inspection of the photographs which have been forwarded to England. If they are really the first thoughts for the figures of the Medici tomb, they should undoubtedly be secured.

*Im Neuen Reich* (No. 14) contains four hitherto unpublished letters of Niebuhr's, written from Rome, 1816-19, to the Minister v. Altenstein. They are valuable, as showing the impression made on him by the movement then inaugurated by the young German artists in Rome. The paintings of Cornelius, Philip Veit, Overbeck, and Wilhelm Schadow, in the Casa Bartholdy, excite his eager hopes, and he earnestly urges their claims to encouragement and aid from the government. He succeeded in obtaining some small sums for them, and even helped them himself as far as his means allowed. He urged the appointment of Cornelius in 1817, as the fitting person to start afresh the Düsseldorf Academy of Art, and eventually obtained for him (1819) an invitation to Berlin with the commission to decorate the theatre in fresco. But the letter reached Rome a month too late; Cornelius had already departed for Munich, and had there engaged to carry out the works of the Glyptothek. The letter from Cornelius to Reimer, appended at the end, contains nothing specially worth notice.

The well-known art-student and collector Baron R. v. Retberg, of Munich, has recently brought out a catalogue of Dürer's etchings and engravings chronologically arranged. This book,

which is the result of many years' labour, is a most valuable contribution to Dürer literature. It offers not only a completely new arrangement of the known materials (Bartsch and Heller are arranged according to technic or subject), but in every instance where written date fails us, carefully stated critical proof is given. The catalogue is prefaced by a sketch of the life of the master, in the form of a convenient summarised table. It had been intended to bring out the volume in time for the Dürer exhibition, which was projected at Nürnberg in 1871, but the war delayed its publication, and also deprived the exhibition of much of its contemplated importance. The *Germanische Museum* is at this moment busied in the endeavour to bring together a collection of all Dürer's known works, either in originals or in accurate copies.

A third edition of Karl Heideloff's *Die Ornamentik des Mittelalters* has just been brought out with a critical, revised text by Professor Bergau.

The number of sales which are taking place in every direction, and which are too important to be left without comment, is almost unprecedented. At the end of March the sale of the Gsell collection at Vienna realised about 2,500,000 frs. French pictures came well to the front. The "Troubadour" of Couture went for 46,000 frs., little bits by Diaz fetching 4000 and 6000 frs. a piece. It is said that a well-known London dealer bought up a lot of canvasses of "all sorts," and the Viennese are delighting themselves with the thought of the number of copies the English are going to swallow.—M. Riocreux's collection of porcelain and faïence, which was sold by auction on March 30, also merits notice. One of the principal pieces was a dish signed on the reverse, "1530, M. G. da Gubbio." The subject in the centre was "Romulus and Remus suckled by the Wolf." The colouring is polychrome with metallic ruby reflections. This went for 700 frs.; an Urbino bowl from the Pasolini collection for 112 frs. The specimens of Nevers and Rouen pottery went comparatively low. For example, a "Flambeau appliqué" (an arm issuing from the mouth of a mask), which was an extremely rare example of Nevers, obtained but 36 frs.—A large portion of the work of Androuet Ducerceau came to the hammer in the second week of April, at the Hôtel Drouot, amongst the effects of the late M. Yaudoyer, the well-known architect. This excessively rare collection was secured for the Berlin Museum, in spite of the zeal of a French amateur, who ran the biddings up to about 5000 frs.—The apparently low prices given at the Persigny sale are now explained by the fact that many of the attributions were incorrect, and a considerable portion of the paintings were either damaged or repainted. The consequence was that a few good things went for less than their real value, so disastrous was the impression produced on amateurs by the close neighbourhood of more than doubtful work. Amongst others may be cited "The Fool," attributed to Velasquez, but probably by the hand of some follower or pupil. This picture, really remarkable in itself, fetched but 750 frs., and was certainly worth more. It became the property, together with the Reynolds ("Prince of Wales"), of M. Maurice Cottier.—The Regnault sale, paintings (19), water-colours (20), drawings (83), studies, sketches, &c. (42), realised 141,031 frs. The principal sums were: for a "Panneau décoratif," 25,000 frs.; "Sortie du Pacha à Tanger," bought by M. Haro, 10,000 frs.; a water-colour drawing, "Cour mauresque avec laurier-rose," 6300 frs.—The two first days of the Gillott sale at Christie and Manson's produced 73,236*l*. Some of the highest prices were as follows: "Hampstead Heath," by Linnell, 1660 guineas; the "Woodlands," Linnell, 2500 guineas; "Roast Pig," by Webber, 3500 guineas; "The Wooden Walls of Old England," Stanfield, 2700 guineas; "The Bay of Naples," by W. Müller, 2000 guineas; "The Chess-players," W. Müller, 3950 guineas. This picture, which is perhaps the artist's *chef-d'œuvre*, excited a keen competition between Mr. Addington and Mr. Agnew, who eventually carried it off. Turner's "Going to the Ball" and "Coming from the Ball, San Martino, Naples," fetched respectively 1700 and 1500 guineas. These pictures are in his later manner. "Checkmate Next Move," by Mr. Horsley, was knocked down to Mr. Cox for 1600 guineas. That portion of Mr. Gillott's collection which represents the early English school came to the hammer on the 26th and 27th April; and the third part, including the old masters and watercolours, will be sold on the 3rd and 4th May.

A remarkably fine specimen of Fortuny's work is now on view at M'Lean's gallery in the Haymarket. The subject is the interior of a Moorish court of vast size. Two culprits lie already in the stocks, while a third is struggling hopelessly with the executioner, and from an inner recess a solemn assemblage look down on the proceedings. The foreshortening is very fine; and in spite of the small size of the figures, the character of Eastern attitude is given with that simple truth which is most unapproachable. A ray of light, clear as day, streams across the picture; and every shadow is full of the most subtle pulsations of colour, the key-note of which is given in the blue-green edge of a motionless pool of water which sleeps, full of glassy reflections, to the left in front. There is no touch of poetry or sentiment, but an air of brilliant and absolute certainty characterizes the whole with a daring charm.

### Theology.

*The Book of Job*. [*Das Gedicht von Hiob*. Hebräischer Text, kritisch bearbeitet u. übersetzt, nebst sachlicher u. kritischer Einleitung, von Adalbert Merx.] Jena: 1871.

THIS volume, as its title indicates, is not a commentary. The author, who has already distinguished himself in other departments of Semitic study, does not appear ambitious to add to his already well-earned reputation, that of a Biblical commentator; though, if there is one book of Scripture which more than another stands in need of detailed treatment, it is the Book of Job. Dr. Merx, however, has undertaken a task which is even more difficult and important than a commentary. He has endeavoured, with the aid of the ancient versions, and in particular of the LXX, to present the original text of Job in a revised and amended form, and certainly no more acceptable service could be rendered to the student of the Hebrew Scriptures than a successful attempt to do so.

The revised text, which, with a translation, forms the principal part of the volume, is preceded by an introduction, in which the author discusses, with distinctness and brevity, the usual questions as to the subject-matter, form of composition, age, &c. of the poem, on which so many conflicting opinions have been expressed. It must suffice to remark here that he considers the Book of Job to be an ideal history, in which the chief personage (*Ijjob* = "the antagonist") is the embodiment of the writer's doubts and antagonism to the received faith, while his three friends are the representatives of that faith, and of the writer's efforts to cling to it and overmaster his sceptical thoughts. A sublime and overpowering revelation of Jehovah brings the conflict to a close. With regard to the revision of the text, the author endeavours (1) to show its necessity, and (2) to point out the principles on which it should proceed. He by no means withholds from the Jewish doctors the due meed of applause for the singular care with which the sacred text has been handed down through so many generations; but at the same time he most justly observes that, besides the question whether the Jewish doctors have faithfully transmitted the text anciently received by them, there is

another of still greater moment, viz. : What was the state of the text when they received it? It is not sufficiently considered that the extraordinary precautions which they adopted for the purpose of preserving the text unchanged must have had the effect of perpetuating old errors, as well as preventing the intrusion of new ones. Unquestionably all the books must have suffered, some to a greater, some to a less extent, between the time of their original composition and the age when their transmission began to be an object of anxious care to the Jews. This is evident not only from a comparison of the traditional text with the most ancient versions, but also from a comparison of various parts of that text with one another, as, for example, the corresponding sections of Chronicles with the text of Samuel and Kings. When, therefore, in our study of the Hebrew Scriptures, we stumble, as we not unfrequently do, on passages from which it is impossible to extract any suitable or even intelligible meaning without having recourse to the most arbitrary treatment, we ought not to keep out of view the possibility of our embarrassment being occasioned by a corruption of the original text, though, indeed, there are scholars who seem prepared to take all sorts of liberties with the grammar and lexicography of the language, rather than sanction the slightest deviation from the Masoretic tradition. Dr. Merx gives examples from Job and elsewhere of textual errors arising from the interchange, the repetition, and the omission of letters. Under the last head he adduces Job xxvii. 18, "He buildeth his house as a moth," עֲבָבָה, for which he would read, on the authority of the Greek and Syriac, עֲבָבָה, as a spider (comp. viii. 14); and he accounts for the change to the present text by supposing the existence of a blemish in the original MS., thus—שׁ עֲבָבָה.

The principles of revision on which Dr. Merx proceeds are in theory extremely simple. First of all, by comparison of extant MSS. he would endeavour to reach as close an approximation as possible to the text of the archetypal MS., from which they have all been derived. The text thus obtained he would set down as one codex. Then, from the ancient versions, chiefly the LXX and Peshito, he would do his best, by the careful study of their language and spirit, to reproduce, in the case of each disputed or difficult passage, the consonantal texts which lay before their translators. To these texts, also, he would assign the rank of ancient codices. And by comparison of the codices thus obtained from the versions with that obtained from the MSS. he would restore the true text. To purely conjectural readings he would have recourse only in extreme cases, when all other means of emendation have failed. With regard to the relative importance of the codices just mentioned, he assigns the first place to that derived from the LXX, as being, in his opinion, more ancient than the others. To the old Syriac version he assigns a middle place, both chronologically and with respect to the character of its readings, between the LXX and Masoretic texts; and for its use in textual emendation he lays down the following rules:—(1) The reading, in which the LXX and Syriac concur, is the more ancient. (2) The LXX is to have the preference, but not very decidedly, even though the Masoretic reading is confirmed by the Syriac. (3) If the Masoretic and LXX concur against the Syriac, the latter is at once to be rejected, unless the internal evidence in its favour is very decisive. The Vulgate and Targum, being both founded on the traditional text, are naturally of inferior value as aids in its reconstruction, except in those cases in which they depart from it and agree with the LXX and Syriac.

It will thus be seen that the main principle on which the author proceeds in his revision of the text of Job is that the LXX represents an older and better text than the Maso-

retic. We believe very few indeed will be found to concur with him in this opinion. In fact, he does not himself venture to carry out the principle to its legitimate results; for it is usually to the emendation of the text only in vexed passages, and not always even in these, that he applies it. Everywhere else he adheres to the traditional Hebrew text against the LXX. But if the LXX text be older and more reliable than the Masoretic in obscure passages, must it not also be so in passages which are not obscure, but in which nevertheless it deviates from the Hebrew? One would imagine it must be so. And, therefore, if the Masoretic text is accepted as a general basis for the revised text (and the author does so accept it, usually following it even where it differs from the LXX), consistency requires that it should have the preference throughout, except in those cases in which it can be shown that the readings suggested by the LXX are superior, not as LXX readings merely, but on other grounds.

Independently, therefore, of the practical difficulties which must be encountered in making the attempt to revise the text of Job on the author's principles, and of which no one is better aware than the author himself, we must express our conviction that the principles themselves are erroneous, and that the adoption and application of them cannot be expected to lead to a satisfactory result. This conviction, we must add, has been quite confirmed by an examination in detail of the author's revised text, which we can by no means accept as a nearer approach to the original form of the text than that of our Hebrew Bibles. We fear that the chief blemishes in the present text date from a period anterior to the age of the earliest version, and cannot now be amended otherwise than by critical conjecture. At the same time we heartily commend the spirit in which the author has undertaken so difficult a task, and the praiseworthy modesty with which he speaks of the result of his labours.

Our space does not permit us to examine Dr. Merx's views of the so-called strophical arrangement of the poem, which also bear (somewhat unfortunately, we think) upon his reconstruction of the text.

D. H. WEIR.

### Intelligence.

Mr. Sanday, of Trinity College, Oxford, well known to our readers by his articles on Keim's *History*, has published the first-fruits of his researches into *The Authorship and Historical Character of the Fourth Gospel*. Those who are best prepared to agree with his conclusions will appreciate the fairness and simplicity with which they are defended. The work is, in fact, remarkable for more reasons than one. First, on account of the thoroughness with which the author has examined the most recent works on the subject, whether English or German, conservative or liberal in tendency. We almost fear that he has carried his laudable desire to be abreast with the latest investigations to an extreme, and that he has injured the effect of his book by too exclusive a consideration of Keim and Sir R. Hanson. Secondly, because of his frank acceptance of the fact that the external evidence is insufficient to decide the question at issue, and his consequent limitation of the enquiry to the evidence supplied by the Gospel itself. Chapter after chapter is analysed, and the psychological verisimilitude of the details brought into bold relief. The circumstantial precision of the narrative is thus found to be so great that "Shakespeare himself, if he had been born after the taking of Jerusalem, could not have written the fourth Gospel as it is" (p. 295). The assumptions of the work are those of a sober orthodoxy. Inspiration is a (supernatural) "heightening of natural faculties;" the miracles of the Gospels are accepted as in the gross "historical," without enquiring too closely into the quality of the evidence. It seemed desirable to address this warning to the reader, in his own interest as well as that of the author. It would be unfair to Mr. Sanday to infer from the studied moderation of the title of his work, and from his adoption—at least in part—of the method of "liberal" criticism, that he is without an opinion on the graver matters which underlie such researches as the present. And it would be unfair to his readers to allow them to suppose that he has done more than touch the outskirts of the question at issue. To be complete, the book should

contain an examination into the antecedent probability that the biographies of the founder of the Christian religion contain a legendary accretion. Mr. Sanday not only ascribes the fourth Gospel to St. John, but implicitly denies that it contains any legendary matter (p. 273). This involves a similar denial with regard to the other Gospels, which no antagonist could accept without demanding a proof. Objection may and doubtless will be offered to many of Mr. Sanday's "psychological" arguments, some of which have a strong likeness to the century, and might possibly have been modified by a more special knowledge of Old Testament criticism. We notice, however, that he accepts "the second Isaiah" (p. 40) as a distinct part of the Old Testament Scriptures. This implies some thoughtful study of the subject, though it follows naturally from the psychological point of view at which the author has placed himself. A review of the work will follow.

A valuable discovery has been made, in the episcopal archives at Coire (Grisons), of two fragments of an old Latin version of St. Luke, which had been stuck on the inside of the cover of a book. They contain Luke xi. 11-29, xiii. 16-34. In the new number of the *Studien und Kritiken*, Prof. Ranke gives the two most important columns, containing Luke xiii. 16-25 ("alligavit Satanas—foris stare dice[n]tes"). He remarks that the text agrees most closely, especially in its omissions, with that of the Codex Vercellensis (sæc. iv.). Either the MS. from which it is taken was a copy of that codex or else both MSS. were derived from one and the same source. Vercelli is only thirty (German) miles from Coire.

The Society for Biblical Archaeology has lately received a rich present for its library, in the shape of an ancient Pentateuch-roll, dating apparently from the tenth century. This MS. is the only copy of the Pentateuch as used by the Aden Jews, descendants of the pre-Mahometan inhabitants, which has yet reached this country. The council of the society hope soon to exhibit the roll to the public, with a detailed examination of its philological and archaeological peculiarities.

### Contents of the Journals.

*Zeitsch. f. wiss. Theologie*, vol. xv. No. 3.—Justin's Relation to the Acts of the Apostles, by Fr. Overbeck. [Seeks to show that Justin, like the Acts, belongs to a stage in post-apostolic gentile Christianity when the genuine Pauline doctrine had lost much of its purity.]—Peter in Rome and John in Asia Minor, by A. Hilgenfeld. [Conservative; against Lipsius on the one hand, and Scholten on the other.]—On the Contradiction between 2 Tim. iv. 20 and Acts xxi. 29; or, On the Imprisonment of the Apostle Paul, by H. Lucht.—Luther's Birth-year again, by H. Holtzmann.—Notices of books.

*Theological Review*, April.—On the Development of Opinion in the Early Christian Church, as indicated by a comparison of the different books of the New Testament. Part II. By the late J. J. Tayler. [A charmingly written popular, but not at all superficial, essay.]—Theism, Atheism, and the Problem of Evil, by Moncure D. Conway.—St. Paul and the Nero-Legend, by C. J. Monro. [Nero the veiled, and Vespasian the unveiled Man of Lawlessness; Vitellius "the restraining agent."]

*Journal of Philology*, No. 7.—Notes on three passages of Exodus, by W. A. Wright. [1. Ex. iii. 14, "I AM, because I am." 2. Ex. xxii. 4 (5). Read *וְהָיָה כְּאֵשׁ*, and render, "If a man shall set on fire . . . and shall put the burning fuel so that he burn up the field," &c. 3. Ex. xx. 4, 5; *וְהָיָה כְּאֵשׁ*, not "likeness," but "shape," or "form." Render, "And as to any form . . . thou shalt not bow down to them."]

*Exotic Butterflies*; being Illustrations of New Species. Parts 1-80. By W. C. Hewitson. Van Voorst.

*Equatorial Lepidoptera*, described by W. C. Hewitson. Van Voorst. *Lepidoptera Exotica*; or, Descriptions and Illustrations of Exotic Lepidoptera. By A. G. Butler. Parts 1-11. Janson.

*Cistula Entomologica*. Parts 1-4. By A. G. Butler. Janson.

*A Synonymic Catalogue of Diurnal Lepidoptera*. By W. F. Kirby. Van Voorst, 1871.

*Catalog der Lepidopteren des Europäischen Faunengebiets*. Von Dr. O. Staudinger und Dr. M. Wocke. Dresden: 1871.

WE have here strung together several recently published works upon the beautiful insects constituting the order Lepidoptera, commonly known under the names of butterflies and moths, with the view of calling attention to the wonderful increase in our knowledge of those tribes which has been made during the last quarter of a century. Looking still further back, we remember the time when exotic Lepidoptera were almost entirely neglected by our entomologists. The great collectors of the last century, especially Drury and Francilone, had passed away, and Mr. Haworth's collection may be said to have been the sole accessible private depository of the traditions which Fabricius had left behind him. McLeay's famous collection was locked up, and it was in Mr. Haworth's cabinet that we were able to find references to the wonderful volumes (seven in number) of drawings of exotic butterflies made during the last quarter of the eighteenth century by Mr. Jones, so constantly referred to by Fabricius, from which, indeed, from time to time, Donovan professed to publish copies of rare species only to be found represented in those delineations. After the death of Samouelle, Edward Doubleday was appointed one of the entomological assistants at the British Museum, and his strong bias for Lepidoptera led to the arrangement and increase of the national collection in a very marked degree, whilst the publication of the fine work on the genera of diurnal Lepidoptera which he commenced, the plates of which were drawn by Mr. Hewitson, extended the taste for these beautiful objects far and wide, which has been further fostered by the publication by the latter of these gentlemen of a series of volumes, of which the title is given at the head of our list, containing most admirable representations of new exotic species. Hence, at the present day, the number of amateurs of exotic butterflies is so greatly increased that many collectors have been despatched to different quarters of the globe to search for specimens. The gigantic collections formed on the Amazons by Mr. Bates and in the Malayan Archipelago by Mr. Wallace have also contributed to swell the lists to a great extent; but still so endless are the productions of nature that even within the last two or three years Mr. Buckley, after less than a twelve months' visit to the eastern slopes of the northern portion of the Andes, brought home a collection of butterflies in which from 150 to 200 new species were contained, most of which have been described by Mr. Hewitson in the second work on our list. In like manner a collection of butterflies, amounting in number to about 50,000 specimens, has recently arrived from Costa Rica, formed by Dr. van Patten, containing about 50 new species, of which the descriptions have been partially published by Mr. Butler in his little periodical work, the *Cistula Entomologica*; the same author having also contributed materially to our knowledge of new exotic species by his work *Lepidoptera Exotica*, in which figures are given which, considering that they are printed in chromo-lithography, in many instances give very characteristic representations of the various objects they are intended to delineate. Many other entomologists, both at home and abroad, are engaged in the

delineation and description of new species, both British and exotic, of butterflies and moths, so that scarcely a periodical devoted to zoological subjects now appears without containing fresh materials towards our knowledge of these tribes.

The fifth work on our list has been already (although too shortly) noticed in our pages. It is a most carefully compiled catalogue of all the species of butterflies of which descriptions had been published almost to the date of its own appearance. It consequently contains the most recent summary of the diurnal portion of the order, being confined to the butterflies, of which it enumerates 7,700 species, not including many named varieties which have been considered as distinct by different authors. In the British islands we possess only 66 species of butterflies; but in Staudinger and Wocke's catalogue (the sixth work on our list) we find that the number of species of butterflies belonging to the European fauna amounts to 456, whilst the number of nocturnal Lepidoptera or moths amounts to about 2800. In this work these authors consider it to be "une erreur, conduisant même à des conséquences absolument fausses, de prendre les limites de la géographie politique pour cadre quand on veut considérer un certain ensemble en histoire naturelle." Their catalogue consequently contains species found in a great part of the north of Asia as well as the Holy Land and north of Persia, and also the mountainous regions of the north-west of Africa, and the Madeira and Canary islands; but it is in the tropical and subtropical regions, especially of the New World, that the great mass of diurnal Lepidoptera is found.

The great additions to our collections of exotic species to which we have already alluded have made us acquainted with the peculiar fact, that certain species common and quite uniform in their appearance and characters in certain given localities, are found in a slightly modified, but persistent, form in other regions, and this peculiarity has given rise to great uncertainty in the nomenclature of the species, some authors contending that these local forms are to be treated as absolutely distinct, whilst others maintain them to be only varieties of the previously known types or races. Let us take, for instance, the gigantic types of the sub-order which, from their size, have well been named *Ornithopterus* (bird-winged), and which are natives of the East; of these we find *Papilio Priamus* made up in Mr. Kirby's catalogue of not fewer than seventeen local forms, which have been named *Priamus*, Linn.; *Panthous*, Linn.; *Richmondia*, Gray; *Cassandra*, Scott; *Euphorion*, Gray; *Pronomus*, Gray; *Poseidon*, Doubleday; *Cronius*, Felder; *Boisdualii*, Montrouze; *Oceanus*, Felder; *Arruana*, Felder; *Urvilliana*, Guérin; *Triton*, Felder; *Pegasus*, Felder; *Archideus*, Felder; *Lydias*, Felder; and *Croesus*, Wallace. (The last-named insect is the one which is described by Mr. Wallace in his *Travels* as having so greatly excited him when he first observed it—and which was sold at 10*l.* per pair when first received in England—that it threw him into a fever for several days.) There is also in India and the adjacent districts and islands a series of very elegant butterflies, of which *Pap. Paris* is the type, distinguished by having their wings powdered with golden-green atoms; they in like manner exhibit permanent variations of no higher specific rank than those of the *Priamus* group in their respective districts, and yet we find each of them in Mr. Kirby's catalogue given as distinct species. So, again, looking at the genus *Papilio* in Staudinger and Wocke's catalogue, consisting only of seven species, we find *Papilio Xuthulus* of Bremer given as a variety of *P. Xuthus* in the text, but in the appendix we are told "bona est species, sec. Felder," whilst the Syrian *P. virgatus* of Butler is doubtfully considered as a variety of *P. Podalirius*.

This diversity of opinion, leading, as may easily be conceived, to endless disputes as to the specific names to be given to this or that presumed species or geographical variety, or sub-species or race, as it has been variously called, may at first sight appear of a trifling character, but very little reflection will show that it involves problems of very wide application, amongst which the modification of form, the evolution of species, and even the question of the unity of the human race, may be mentioned.

"Von viel grösserer Bedeutung sind die Localvarietäten oder Racen, von mir mit *v.* (varietas) bezeichnet. Manche derselben werden sogar als eigene Arten betrachtet, und lässt sich hierüber gar nicht streiten, da dies ganz von den mehr oder minder Darwinistischen Ansichten des Einzelnen abhängt."

Hence it may be safely inferred that the careful investigation of the extent of variation exhibited by the individuals of these sub-species, the modes in which they differ, *inter se*, the possibility of their effecting prolific breeds when crossed together, and other such enquiries, upon the spot where the insects occur, must be made before we can arrive at a satisfactory conclusion (even if then) as to the extent and limits of each species. In the meantime it may be suggested not only that, until such result has been obtained, each clearly distinct local and permanent variety should be named, but that, wherever possible, names should be given which should indicate in some way or other the connection of the local form with the type of the species. This has, indeed, been partially attempted by using prefixes, as in the case of *Charaxes Jasius* and *Epijasius*, or identical terminations, as in *Papilio Protesilaus*, *Autosilaus*, *Agesilaus*, *Macrosilaus*, *Telesilaus*, *Penthesilaus*, &c., or by forming anagrams from the name of the type species.

And this brings us to the consideration of another difficulty which threatens, at the present day, to become a very serious stumbling block in the way of science, namely, the perpetual change in the names, not only generical (as might more reasonably be expected), but also specific, even in the case of species well defined and universally admitted as such. The binomial system of nomenclature, introduced by Linnaeus, is now adopted throughout the animal and vegetable kingdom by nearly every naturalist, and the rule recognised is that the first name given (with a satisfactory description) to a species shall thenceforth be its permanent designation. Now this at first sight seems to be a very simple rule, but its working is not so. For instance, a description of an insect may be a very good one, taken, however, from an extreme variety, and which, not agreeing with the ordinary type of the species, has misled a subsequent writer into describing the type under a different name; when, however, the previous description of an accidental variety is found, it is immediately said that it must supersede the latter. So, when a description is found in some obscure work of a species which has for half a century or more been universally known under a name published subsequently by some well known writer, we are now told that we must take up the first name, and in this manner the nomenclature of the science is perpetually shifting. As examples: the two common European swallow-tailed butterflies of Europe are known throughout the scientific world under the names of *Papilio Machaon* and *Podalirius*, but Rennie, having discovered that Retzius (as he fancied, previous to Linnaeus), had given to the former the name of *Papilio Reginae*, resuscitated the latter name, whilst even Staudinger and Wocke in their catalogue before us have given the name of *Papilio Sinon* to *P. Podalirius*, Poda in 1761 having described it under the former name, before Linnaeus first gave it, as they thought,

\* Staudinger, pref. p. xxii.

in 1763, the latter. This is a striking instance of this system of *resurrection*, as it has been termed, holding, as the species does in their system, the conspicuous position of the head of the whole of the Lepidoptera. Mr. Kirby, who has adopted this system of hunting out old names to a greater extent than any previous author, quotes these dates (or rather he quotes Linnaeus under the year 1764), and consequently he ought to have given *Podalirius* under the name of *Sinon*, which he has not done, and ludicrously enough Staudinger and Wocke subsequently discovered that Linnaeus in fact employed the name of *Podalirius* in the 10th edition of the *Systema Naturae* in 1758, and have, consequently, in their appendix been obliged to restore the latter name. Now the use of names is but supplementary to a knowledge of the objects designated, and although it may be true that "Nomina si periant, perit et cognitio rerum," the laws of nomenclature have their limits as well as the laws of any other kind of property, and as undisturbed possession of an estate for a certain number of years is held to bar all previous claimants so I do not hesitate in suggesting that, where a name has been universally adopted for a species for a certain number of years (say 25), no previous name may be restored. In fact, in such case I entirely agree with the dictum quoted by Mr. Lewes, that "Communis error facit jus."

I. O. WESTWOOD.

### Scientific Notes.

#### Physiology.

**The Action of Galvanic Currents on Nerve and Muscle.**—Professor L. Hermann contributes a long paper on this subject to the 6th part of *Pflüger's Archiv*, in the course of which he shows that living muscle offers very much greater resistance to an electric current passing in a direction across the fibres than to one transmitted along them, the average difference being as 7:1. In muscles which have passed into the condition of *rigor mortis*, this difference almost entirely disappears. In living muscle the specific resistance in the longitudinal direction (taking that offered by mercury as unity) is about 2,330,000, and in the transverse direction about 15,134,000. A similar difference in the amount of resistance offered to the passage of a current in these directions is noticed in the case of the nerves, the ratio here however being somewhat less, namely about 5:1. The absolute specific resistance of nerve in the longitudinal direction is 2,554,000, and in the transverse direction 12,586,000, that of mercury being taken as 1. The longitudinal resistance of the nerve is augmented by heating it to 50° C. (122° Fahr.), the transverse resistance simultaneously diminishing. At the boiling temperature, however, the longitudinal resistance rises to that possessed by the living nerve. Professor Hermann connects these differences in the resistances offered by the longitudinal and transverse section of the nerves with the different polarizability of the sheath and nucleus of the fibres, and gives numerous and elaborate mathematical formulae bearing upon the subject. He also describes a new universal commutator.

**The Relation of Uric Acid to Muscular Action.**—M. A. Sawicki gives the details of a series of experiments on man, which show that the quantity of the acids excreted by the kidneys depends to a far greater extent upon the quantity and quality of the food ingested than upon the amount of exercise taken (*Pflüger's Archiv*, part vi.).

**The Vagus, the Sensory Nerve of the Heart.**—K. Gurboki (*Pflüger's Archiv*, part vi.) shows that in the frog the vagus is the sensory nerve of the heart, by the following experiment:—The vessels of one or both lower extremities of a frog are first ligatured, and the animal is then poisoned with woorara, the thorax and pericardium are opened, and the posterior surface of the auricle irritated with a sponge dipped in acetic or, still better, in sulphuric acid. Each time that the spot in question is irritated, reflex contractions occur in the posterior extremities. If, however, the vagi have been divided, no contraction occurs, showing that these nerves constitute the paths along which the sensory impulses exciting the contractions are transmitted.

**Peripheral Distribution of Non-Medullated Nerve-Fibres.**—Dr. Klein, of the Brown Institution, continues the publication of his researches on this subject in the April number of the *Quarterly Journal of Microscopical Science*. He calls in question the correctness of Dr. Beale's statements regarding the "ultimate nerve-fibres," maintaining that such fibres correspond to the *coarser* non-medullated fibres, which are rendered visible by the mode of preparation that he, Dr. Klein, has

employed. From this *coarser* plexus spring a number of finer nerve-fibres, still provided at rare intervals with nuclei, forming a rather dense plexus, that in the case of the arteries resembles a perivascular sheath. From these fibres, again, still finer ones may be traced, which no longer exhibit nuclei, and enter the wall of the vessel itself.

**Histology of the Nerves.**—M. Ranvier, in a paper in Brown-Séquard's *Archives de Physiologie*, describes a peculiar feature in the microscopical character of the nerves, which, he says, has hitherto been entirely overlooked, or has only been very imperfectly recognised. On examining very fresh nerves, he finds that they present a series of annular constrictions placed at regular distances about a millimetre apart. As it is almost impossible to tease out perfectly fresh nerves into thin constituent fibres, he macerates them for a very short time in picrocarmine of ammonia, osmic acid, or nitrate of silver; the cylinder-axis of the nerves becomes stained with picrocarmine of ammonia or nitrate of silver, whilst the white substance of Schwann remains uncoloured. When a nerve-fibre is exposed to the action of these agents, it becomes stained at each constriction, showing that the white substance of Schwann is absent at these points. With perosmic acid, on the contrary, the white substance of Schwann blackens, whilst the cylinder-axis remains for a time unchanged: a nerve-fibre macerated in this acid exhibits a clear part at each constriction, but is blackened elsewhere, giving therefore confirmatory evidence that the white substance is not present at these points. It appears, then, that the nerve is divided into a series of segments by the presence of regularly disposed constrictions, and that at these constrictions the sheath of Schwann is either absent or reduced to an extremely thin layer, the cylinder-axis coming into proximity, if not immediate contact, with the external sheath. A small mass of protoplasm or nucleus is found at some point along the length of each internode, and usually at an equal distance between two adjacent constrictions. This has led M. Ranvier to suggest that each node was originally a cell, and that the fibres are composed of nerve-cells placed end to end and attached to one another by a thin cementing layer.

**The Nerves of Taste.**—M. Lussana, in the journal where the foregoing observations occur, contributes a paper on the nerves of taste, in which he shows, from pathological cases, that the sense of taste in the forepart of the tongue is not derived, as has always been supposed, from the fifth nerve, since the branches of this nerve may be entirely paralysed, and yet the taste be perfectly preserved. He likewise refers to cases in which the taste was entirely lost, while the sensitiveness to tactile impressions was undiminished in all the parts supplied by the fifth nerve; on the other hand, the sense of taste in the forepart of the tongue is lost after section of the facial nerve near its origin. M. Lussana therefore considers that the gustatory nerves of this part are due to the fibres from the facial contained in the *chorda tympani* which joins the gustatory branch of the fifth nerve, and not to the fifth itself.

**Transversely Striated Muscular Tissue in Acanthamoeba.**—J. H. L. Flögel states that he has been able to determine the presence of transversely striated muscle in a species of *Trombidium*, by placing the whole animal for an hour or two in a one per cent. solution of perosmic acid, washing it in water, and then dissecting it in a very weak solution of glycerine. The transverse striae are very wide apart; each fibre appears to be composed of a semifluid substance, which remains uncoloured in perosmic acid, and is filled with denser columns, the fibrils.

**Germination of Cryptococcus.**—Hallier complains, in the last part of his *Zeitschrift für Parasitenkunde*, of the unreasoning opposition that has been offered to his views on the germination of the lowest forms of fungi. His present paper is devoted to the proof of the capability of germination of cryptococcus, and he considers the following propositions to have been satisfactorily demonstrated. 1. The yeast of beer germinates whenever it is placed under favourable conditions. 2. As long as the germ-tubes and their branches grow in a moist place, rod-like germ-cells are constricted off at their extremities. 3. Beer-yeast consequently belongs to the mould fungi (*Schimmelpilze*), of which it constitutes a one-celled form, and is in no way connected with the *Ascomycetae* of Reess, on which point Dr. Reess has fallen into an error, pardonable enough considering the difficulty of the investigation. 4. Smut (*Ustilago carbo*, Tulasne), when its germ-tube grows in spots moistened with distilled water, behaves itself exactly like the germ-tube of yeast, that is, rod-like cells are constricted off from the extremity of every fibre. 5. The parasite found in the urine of typhus patients, when placed in a nitrogenized solution of sugar and other fluids capable of undergoing fermentation, buds like cryptococcus, and increases in the same manner. 6. Moreover, cryptococcus cells germinate under favourable conditions, and their germs comport themselves like beer-yeast when placed on a moist bed. 6. The germ-cells of Haubner's skin-fungus of the horse behave like those of yeast under similar conditions, that is, in fermentable fluids they develop cryptococcus-cells, which, under favourable circumstances, germinate and constrict off elongated cells from the ends of the fibres.

**On Epilepsy artificially produced.**—It is well known that M. Brown-Séquard has performed experiments which prove that by sec-

tion of certain columns of the spinal cord of the guinea-pig, and of certain of its nerves, as the sciatic, zones or regions of the skin are so affected that on causing an irritation of these parts by pinching or pricking the animal is thrown into an epileptiform state. These experiments have lately been repeated and varied by M. Westphal, who finds that a slight tap on the head of a guinea-pig causes an attack of epilepsy either immediately or after the lapse of a minute. The blow, it should be mentioned, must not be a severe one, or the animal will die, either with or without convulsions, from arrest of the respiratory movements, the heart continuing to beat for some minutes. After a little time an epileptogenic zone is developed on the head. The duration of the epilepsy thus produced is from six weeks to six months. The two young ones of a female thus rendered epileptic also presented a zone the excitation of which was followed by epileptic attacks. If the skin of the head is divided, and the exposed bone percussed, an immediate attack is the result; the attacks therefore are not occasioned by any irritation or excitation of the integuments. M. Westphal attaches much importance, in a pathogenic point of view, to the little hæmorrhages that occur in the white substance of the *medulla oblongata* and of the spinal cord, especially to the latter, because, according to Brown-Séquard, lesions of the cervical portion of the spinal cord are always followed by epilepsy in the guinea-pig, while lesions of the *medulla oblongata* do not produce this disease in such animals as survive the injury. At the conclusion of his work, M. Westphal mentions two cases of non-traumatic epilepsy in men in whom an epileptiform zone was formed. (Brown-Séquard's *Archives de Physiologie*, March 1872.)

### Geology.

**The Geology of East Greenland between 73° and 76° Northern Latitude.**—The valuable collections of rocks and fossils brought home by the German Polar Expedition of 1870 have been examined by F. Toulou and Dr. Lenz, of Vienna, who have just published their report (*Verh. der geol. Reichsanstalt*, No. 4, 1872, p. 71). It appears that that portion of the continent of Greenland lying between 73° and 76° 30' is formed of crystalline rocks; the islands along the coast consist in part only of the primary rocks, being covered in places with others of the Mesozoic or Cainozoic period. Some of these islands, like Shannon, are in part only of volcanic origin; the majority, however, Pendulum and Sabine islands, for instance, are chiefly composed of dolerites, anamesites, and basalt-tufas. The basalt stretches from N.E. to S.W., begins at Shannon, and, crossing Pendulum and Sabine islands, forms the important peninsula between False Bay and Tyrol Fjord, traverses Jackson Island, and proceeds thence to the east coast of Greenland. The basalt covers vast areas, but real eruption cones are nowhere observed. The anamesite exhibits the characteristic columnar structure. Miocene beds are met with in several districts; between the southernmost point of Hochstetter promontory and Cape Seebach it forms a low hilly country, at the base of a ridge of crystalline rocks, and consists of a yellow sandstone with casts of a *Cytherea*-like bivalve; on the south-eastern side of Sabine Island it occurs as quartzose sandstone with *Taxodium distichum miocenium*, *Populus arctica*, and *Diospyros brachysepalis*. These beds evidently belong to the same horizon as the Miocene strata of Western Greenland, Iceland, and Spitzbergen. The Miocene beds between Cape Albrecht and Cape Borlace Warren contain lignite. Mesozoic rocks are met with on the eastern and southern shores of Kuhn Island; the Jurassic deposits of this locality are composed partly of marls and sandstones, and greatly resemble those in Russia. The coarse sandstones and breccias of the southern shores of the island, which contain coal, belong to the middle Dogger (inferior polite). The Jura of Kuhn Island rests on the crystalline rocks of a lofty mountain-ridge, which, capped with ice and snow, separates the two groups of Jurassic beds. The marl of the eastern portion of Kuhn Island is partly formed of the *Amella concentrica*, Fisch., which characterizes the Russian Jura, as well as casts of *Cyprina*, three species of belemnites, and two of ammonites, all of which have allied forms in the Russian Jura. The Dogger beds (lower oolite) containing coal, on the south coast of Kuhn Island, perhaps belong to the same horizon as the coal-bearing Jura of Brora and of the islands of Mull and Skye; *Goniomya Vscripta*, Sov. sp., a *Myacites modiola*, *Avicula Munsteri*, Gdf. sp., were obtained from this deposit. The occurrence of Rhaetic beds on the south coast of False Bay is of very great interest; they were identified by *Rhynchonella fissicostata*, Suess, and other characteristic fossils. Palaeozoic rocks are in all probability represented by a series of red, brown, bluish, and greenish calcareous shales and veined limestones on the north side of the Kaiser Francis Josef Fjord. Among the more prominent of the crystalline rocks are various kinds of gneiss, at several places showing stratification. Another deposit worthy of notice is a dolomite with traces of graphite, which occurs in gneiss in False Bay.

**The Purbeck Beds of Southern France.**—At a recent meeting of the Société géologique de France, M. Hébert stated that in the Mediterranean Jura of France, between Grenoble and Yenne, in Savoy,

M. Lory had found vast deposits of limestone, overlying the white limestone with *Terebratula moravica*, which contain freshwater deposits exhibiting the characters of the Purbeck beds. This confirms what Zittel said some time ago, that the Purbeck beds and the upper Tithonian were formed during the same epoch.

**The Origin of the Wealden Formation.**—At the meeting of the Geological Society of London, held on the 20th March, Mr. C. J. A. Meyer directed attention to the probable origin of the Wealden beds of the south-east of England. He doubted the correctness of the view which derives them from the delta of a single river, regards them as a fluvio-lacustrine rather than a fluvio-marine deposit, and attributes their accumulation to the combined effect of several rivers flowing into a wide but shallow lake or inland sea. The evidence adduced in favour of this theory is mainly as follows: the quiet deposition of most of the sedimentary strata, the almost total absence of shingle, the prevalence of such species of Mollusca as live in nearly quiet waters, the comparative absence of broken shells such as usually abound in tidal rivers, and the total absence of drift wood perforated by Mollusca in either the Purbeck or Wealden strata.

**The Habitat of Brachiopoda in Former Epochs.**—J. Fuchs, of Vienna, in the columns of the *Verhandl. der k. k. geol. Reichsanstalt*. (No. 6, p. 1), calls attention to the fact that, contrary to the habits of existing kinds of Brachiopoda, now found at great depths, the extinct species of former epochs lived on shallows and shores. He illustrates this remarkable fact in the Pliocene of Sicily and Calabria, consisting of two deposits, a chalky marl with an abundant fauna, identical with the present Mediterranean fauna, and a littoral deposit with oysters, *Pecten*, *Balanus*, &c., as well as enormous numbers of Brachiopoda, which are collected in vast banks, and which are entirely wanting in the deep-sea deposit. The same phenomenon is observed in the basin of Vienna, where the large *Terebratula* occurs, not in the deep-sea deposits, but invariably in the littoral zone, associated with *Balanus*, *Patella*, *Clypeaster*, &c.; the same feature presents itself in the Crag of England and the Tertiary of Dober, near Bünde. Deposits of Mesozoic and Palaeozoic periods no less strikingly illustrate this fact. We may mention the Brachiopoda deposits of the Quader sandstone, the Stramberg coralline limestone, the Nattheim coral Rag, the middle Lias of Fontains-Étoupefour, the Hierlatz beds, and the Cassian bed, and, among the Palaeozoic rocks, the *Stringocephalus* limestone, Wenlock rocks, &c. In all these strata we find Brachiopoda associated with large corals, bivalves with thick shells, and phytophagous Gasteropoda, and rarely, if ever, do we meet with them in the deep-sea deposits of these formations.

**Age of the Rock-Salt and Sulphur Deposits of Sicily.**—By the researches of S. Mattura (*Memorie per servire alla descrizione della carta geologica d'Italia*, publ. del R. Comitato geologico del Regno, vol. i. p. 53, 1871) it appears that these beds belong to two different horizons, the first being most probably of Oligocene age ("Miocene inferiore" of the author), and the latter belonging to the true Miocene. It is, moreover, probable that the marine deposits of the Miocene were separated into two portions by a freshwater deposit and a stratum bearing gypsum and sulphur.

**Corundum of North Carolina.**—Corundum has long been known to occur in Franklin Macon Co., N. C., in large loose masses. Through the energy of Colonel C. W. Jenks the masses have been traced to their source in veins in the Blue Ridge about 2500 feet above the sea-level. The chief vein, four feet in width, is made up of crystalline masses or isolated crystals of corundum, of a fine blue, greyish-white, or red colour, mixed more or less with the crystallized chlorite occurring with it. (*Am. Jour. Sc.* April, p. 301.)

**Two New Ornithosaurians from the Cretaceous of Kansas.**—In the *American Philosophical Society's Journal* for March, D. Cope describes two new species of Ornithosaurian, which resemble in their vast dimensions the pterodactyles of the English chalk and greensand. The specimens consist chiefly of portions of the anterior limb, of metacarpals and phalanges. Some of the phalanges of the claw-bearing digits are remarkable for their comparatively large diameter, a peculiarity stated by Seeley to characterize the species of his genus *Ornithochirus*.

**The Cretaceous Fishes of Kansas.**—The same author, in the January number of the above journal, gives a list of all the fishes of the Cretaceous period of Kansas, which shows the remarkable synchronism existing between the chalk formations of Kansas and England. Out of twenty-five genera of fishes only three are peculiar to Kansas.

**A New Fossil Butterfly.**—According to the *American Naturalist* for March 1872, p. 179, S. H. Scudder has discovered a new species (and genus) of butterfly from Aix. It is preserved in the Marseilles Museum, and has been named *Satyrus Keynesi*, after the director. The specimen mainly consists of the two fore-wings, the venation of which is very perfectly preserved. Though nearest to the East Indian *Debis*, it has the form and general appearance of *Portlandia*.

**A Giant Trilobite.**—At a recent meeting of the Geological Society of France (*Revue scientifique*, March 30, 1872) M. Bayan showed a trilo-

bite from Angers, which has a length of not less than from 70 to 80 centimetres, or a size nearly double that of the largest known specimens. M. Bayan believes it to be allied to the genus *Lichas* and the species *L. Heberti*.

### Chemistry.

**Oxidation of Gases with Chromic Acid.**—E. Ludwig (*Ann. der Chem.*, April 1872, 47) has published the results of his investigation of the oxidizing action of this acid of some of the gases. The gas to be examined was collected in a eudiometer over mercury, and the concentrated acid introduced in a ball of dried plaster of Paris. Carbonic oxide is converted at ordinary temperatures into carbonic acid, and can subsequently be determined by absorption with potash; the author suggests the employment of this reaction for the detection of carbonic oxide in gaseous mixtures. 20 cc. of the oxide were converted into acid in from eight to ten hours at ordinary temperatures, and in three hours at 35° C. Hydrogen will take oxygen from chromic acid: 35.8 cc. of this gas in contact with the acid were reduced to 16.5 cc. in forty hours at 17° C., and in eighty-six hours had been completely converted into water. Marsh-gas undergoes no change, not a trace of carbonic acid being detected in it after a week's exposure to the concentrated acid. Chapman and Thorp have previously shown that at higher temperatures chromic acid converts ethylene into carbonic acid and water; at ordinary temperatures, however, formic and probably acetic acid are also produced. When the reaction is complete, the gas will have expanded one-third of its bulk, and be found to consist of carbonic acid only. Had all the carbon of the ethylene been oxidized to carbonic acid, the volume of the gas would have been doubled.

**Conversion of Albuminoids into Urea by Potassium Permanganate.**—The accuracy of the results of Béchamp's observations on this question having recently been doubted, E. Ritter (*Comp. rend.* 73, 1219) repeated Béchamp's experiments, and has arrived at the same conclusions as that observer. Albumen, fibrin, and gluten were in part converted into urea; 30 grammes of albumen gave 0.09 gramme of urea, the same amount of fibrin only 0.07 gramme; while the like quantity of gluten furnished about 0.3 gramme; in the last case Ritter observed a second crystallized product, which he is now investigating. During these operations of oxidation a moment arrives when heat should be applied and permanganate added with great caution, lest the reaction go too far.

**Conversion of Cane Sugar into Grape Sugar by the Action of Light.**—Early last year E. M. Raoult (*Compt. rend.* 73, 1049) placed equal volumes of a solution of 10 grammes of white cane sugar in 50 grammes of water in two tubes, which were sealed after their contents had been boiled for a short time. They were both exposed to the same temperature for five months, one in darkness, the other in the light. At the end of this period both solutions were perfectly clear and free from germs; the contents of the former tube gave no turbidity with alkaline copper solution, the liquid in the latter a strong reaction, one half the sugar having been changed into glucose.

**Bytownite.**—An examination of some microscopic sections of this compact non-crystalline substance has convinced F. Zirkel (*Mineral. Mittheil.* No. 2, 61) that it can no longer be regarded as a distinct member of the felspars. Though presenting to the eye the appearance of homogeneous structure, he finds it made up of four distinct minerals: a triclinic felspar, the crystals of which are sometimes  $\frac{1}{2}$  mm. in length, tufts of crystals of hornblende of various shades of green, granules of quartz and of magnetite. The structure throughout is micro-granitic, without a trace of matrix not identical with one or other of these minerals. Bytownite has a constitution similar to that of the kugeldiorite of Corsica, and accords in chemical composition in a remarkable way with it, as well as with a so-called anorthite-augitic rock from Carlingford. All these agree in a low percentage of silica and alkalis, a large proportion of lime, and very large amount of alumina. The microscope, however, has shown that bytownite is not a mineral species, but a mixed crypto-crystalline rock, which will have to be excluded from the classification of the felspars proposed by Tschermak, who placed it between labradorite and anorthite.

**Isuretine, a Base Isomeric with Urea.**—A paper by W. Lossen and P. Schifferdecker, on the mode of formation and chemical characters of isuretine, is published in *Zeitsch. der Chem.* vii. 594. This base is produced when an alcoholic solution of hydroxylamine is left in contact with strong hydrocyanic acid for two days. The mixture is then evaporated at about 30° to 40° C. and allowed to cool, when isuretin separates in large crystals that can be recrystallized from moderately warm spirit. 190 grammes of hydroxylamine nitrate gave about 60 grammes of isuretin, or half the theoretical amount. During the preparation of its salts, of which the hydrochlorate, sulphate, picrate, and others, have been minutely studied, the temperatures of the solutions had to be kept as low as possible, to prevent decomposition and formation of ammonia salts. When heated alone, it decomposes with energy, yielding ammonium carbonate and ammelide. Hot water also destroys it, urea and

biuret being among the products of the action. The authors are as yet unable to assign a rational formula to their new base; they conclude, however, from the rapidity of its decomposition at higher temperatures, as well as from the readiness with which it colours iron chloride and reduces silver solutions, that isuretine is still a derivative of hydroxylamine. Should this be the case, they give a preference to the following formulae:—

**The Changes in Colour of Manganese Chloride.**—The chloride of this metal, when in solution, develops hues as varied as its oxides do. According to F. W. Krecke (*Journal für prakt. Chem.* 1872, 106), a solution of the rose-coloured crystals in from ten to twelve pints of water is, whether cold or boiling, devoid of colour; when evaporated, it becomes bright red, the tint increasing in depth with the concentration of the liquid. During evaporations at temperatures above 70° the redness attains its greatest intensity when the liquid contains 15 per cent. of salt. With further concentration an orange tint makes its appearance, and as soon as 20 per cent. of salt are contained in the solution, it becomes of a bright yellow, resembling that of weak potassium chromate. If it now became cold, the yellow changes to the original rose colour. Analysis demonstrated that by the original change from rose to yellow no combined acid was evolved, the yellow solution having the composition indicated by the formula  $\text{MnCl}_2 + 28\text{H}_2\text{O}$ . Further evaporation between 70° and 100° C. develops a green colour, which finally rivals that of a strong solution of a nickel salt; this again on cooling changes to yellow, and eventually recovers its rosy tint. Here, it appears, a little acid, about 1.6 per cent., is liberated, the decomposition beginning when the solution contains 36.9 per cent. of manganese chloride, and possesses a composition represented by the formula  $\text{MnCl}_2 + 12\text{H}_2\text{O}$ . The green colour is not a result of the loss of acid, but is due, the author observes, to the presence of anhydrous chloride in the solution.

**Chemical Constitution of the Leaves of *Ampelopsis hederae*.**—The leaves of the Virginian Creeper are known to give a very strong acid reaction, but beyond the determination of the presence of tartaric acid in them by Wittstein very little is known of their chemical characters. They have recently been examined by E. von Gorp-Besanez (*Ann. der Chem.* 1872, parts 2 and 3, 225). In leaves gathered in June he found acid potassium tartrate, neutral calcium tartrate, and calcium sulphate, gum and sugar, probably a mixture of levulose and dextrose. The ash contained 24.6 per cent. of potash, 34.4 per cent. of lime, 8 of phosphate of iron, and 5.8 of phosphoric acid. Other leaves, gathered in September, had a somewhat different composition. Though the crystals deposited from their extract were found to be calcium tartrate only, the liquid contains pyrocatechin (oxyphenic acid), and the lime salts of malic and glycollic acid. *Vitis vinifera* is the only other plant in which the latter acid has yet been found. As Hoppe-Seyler has shown that pyrocatechin is formed when carbon hydrates are heated with water under great pressure, as well as by treating them with acids, the discovery of this substance in the living plant is not without interest to the physiological chemist.

**Devitrification.**—Benrath attributes the many failures which have attended enquiries into the change that glass undergoes by long exposure to the temperature at which it becomes soft to the imperfect removal of the unchanged glass from the crystals that were examined. He finds (*Der Naturforscher*, 1872, No. 9, 70) that hydrofluoric acid acts more easily on transparent than devitrified glass, and has used this reagent to separate them. A comparison of the composition of a specimen of plate-glass before and after etching showed that, though the percentage of silica in the residue had but slightly changed, that of lime had considerably increased. A specimen of the same glass, after devitrification and treatment with hydrofluoric acid, lost but little of its lime, while the percentage of silica had increased 8.6 per cent. The author assumed therefore that devitrification consists in the separation of more acid and consequently denser silicates from the melted glass. To test this, a very acid glass of the formula  $\text{NaO}, \text{CaO}, 8\text{SiO}_2$  was prepared, and readily devitrified. When cold, its mass was chiefly made up of small spherular bodies, from which the less abundant transparent portions could easily be detached. The former by the above treatment yielded crystallized silicic acid. The separation of silica in this form, as well as that of felspar, was also observed in basic devitrified glasses. The author regards this modified glass, not as a mixture of several silicates having three or four equivalents of acid, but as a solution of silicic acid in a glass, probably of the composition  $\text{RO}, 2\text{SiO}_2$ .

### Physics.

**The Heat-Spectra of the Sun and Lime-Light.**—The discontinuity of the solar heat-spectrum was first determined by Sir John Herschel, who with a flint-glass prism threw a spectrum on paper blackened with soot and moistened with alcohol, and estimated the

thermal effect of the spectrum by the time of drying. He observed that the moistened surface dried in a series of four distinct spots. Fizeau and Foucault also noticed the existence of bands in the ultra-red rays; later observers, however, who have investigated the distribution of heat in the solar spectrum delineate the heat-curve as continuous. M. Lamansky (*Phil. Mag.* April, 1872, from *Monatsberichte Akad. Wiss. Berlin*), during his experiments on this subject, noticed that, beginning from the line D and advancing towards the ultra-red end of the spectrum, the deflections of the galvanometer, corresponding with the heat-effects, become, though not proportionately, stronger until they attain a certain maximum and then diminish; this takes place four times, and shows that the ultra-red rays are interrupted in three places by breaks or bands. These bands have a corresponding position in spectra produced either by a glass, bisulphide of carbon, or rock-salt prism, and differ only in becoming broader when the prism used has a greater dispersive power. The breaks or bands are not equally wide; the first is much more sharply separated from the second than the second from the third. Parallel experiments with rock-salt apparatus—made the one in the morning and the other about noon—show that the breaks become somewhat narrower with increasing altitude of the sun. They were also rather deeper on the days when the relative moisture of the air was greater. M. Lamansky does not consider the observations sufficient to warrant our ascribing these bands to atmospheric absorption. In all the experiments it was observed that the heat-effect of the solar spectrum after attaining its last maximum sinks suddenly. A similar examination of the lime-light spectrum showed that there was no break of continuity as in the solar spectrum, and that the position of maximum heat-effect is much farther from the end of the visible red in the former than in the latter. In other words, with the feebler sources of heat the intensity of heat-effect attains its maximum for rays of greater wave-length than is the case with more powerful sources of heat.

**Absorption-Spectra of Gases and Vapours.**—M. Gernz (*Comp. rend.* 1872, Nos. 10 and 12) finds that all more or less coloured gases are capable of yielding absorption-spectra if only a sufficient thickness be examined. For this purpose he encloses the gas in a long tube terminated with parallel glass plates, and transmits a ray of light from a Drummond lamp along the axis of the tube, the ray on emerging being examined by the spectroscope. In this way the spectrum of chlorine, enclosed in a tube 468 decims. in length, exhibits a number of fine lines that commence a little beyond D and extend nearly to the violet, which is entirely absorbed. Chloride of iodine, in a thickness of 30 centims., furnishes a spectrum very different from that of chlorine, but analogous to those of bromine and iodine. Sulphur vapour was examined by heating sulphur in a porcelain tube 50 centims. long, closed by parallel glass plates. As soon as the sulphur vaporises, it produces a gradual extinction of the spectrum, commencing in the violet and extending to the red, no lines being visible. On continuing the heating, however, the vapour begins to allow other rays than the red to pass, and as the yellow, green, blue, and violet portions of the spectrum reappear, a series of lines commencing in the violet and extending to the green become visible. Selenious acid gives a system of absorption-lines lying chiefly in the violet and blue.

**The Specific Heat of Carbon.**—An important paper on this subject appears in the *Ber. der Deut. Chem. Gesell. zu Berlin*, of April 22, 1872, p. 303. It was held by Dulong and Petit, as a result of their experiments on twelve of the metals, that the product of the atomic weight and specific heat, in other words, the so-called atomic heat, had the same value, about 6.5, for all elements. Later observers have remarked striking departures from this law, and a comparison which H. F. Weber makes in the paper alluded to of the numbers obtained by Regnault, de la Rive, Kopp, and Willner, as representing the specific heat of carbon, clearly demonstrates that the different allotropic modifications of this element have very different specific heats, no one of which obeys Dulong and Petit's law, while the values assigned by these physicists to the specific heat of any one modification greatly differ. This he attributes to the fact that the specific heat of carbon in all its modifications varies with the temperature in a degree that would scarcely be supposed. By experimenting on two large diamonds he finds that the specific heat of carbon increases with the temperature to a degree surpassing any other substance, the specific heat of diamond being trebled by a rise of temperature from 0° to 200° C. The research was conducted in the physical laboratory of Prof. Helmholtz, in Berlin.

**The Sun's Rotation.**—The rate of the rotation of the sun has been measured by Zöllner and Vogel with the aid of Zöllner's reversion spectroscop (Revue scientifique, March 30, 1872). The sun turns from west to east, his eastern edge moving towards the earth, the western from it. The rays emitted by the eastern edge ought, when examined with a prism, to be found to be more refrangible than those of the western edge. The displacement of F was carefully determined, and found to be about one-hundredth of the distance between the two sodium lines. This is a variation of refrangibility corresponding with a velocity at the solar equator of 2.59 kilometres per second.

On the night of the 15th–16th March, Prof. R. Luther, of Düsseldorf, observed another minor planet (118) Peitho. He gives the following data:—Düsseldorf mean time: 1872, March 15, 14h. 18m. 59.6s. R. A. in time: 12h. 7m. 26.73s. North Dec. +10° 17' 26.5". *La Revue scientifique* for April 15 records the discovery of two more planets, one, of the 11th magnitude, by M. Paul Henry, of Paris; the other, also of the 11th magnitude, by M. Borely, of Marseilles.

### History.

1. History of Greece from the Taking of Constantinople by the Turks to the Present Time. [*Geschichte Griechenlands von der Eroberung Konstantinopels durch die Türken im Jahre 1453 bis auf unsere Tage.*] Von Karl Mendelssohn-Bartholdy. I. 1870.
2. History of Italy from the Foundation of the Reigning Dynasties to the Present Time. [*Geschichte Italiens von der Gründung der regierenden Dynastien bis zur Gegenwart.*] Von Dr. Hermann Reuchlin. III. 1870.
3. History of Spain from the Outbreak of the French Revolution to the Present Time. [*Geschichte Spaniens vom Ausbruch der französischen Revolution bis auf unsere Tage.*] Von Hermann Baumgarten. III. 1871. Leipzig: Hirzel.

THIS valuable collection of separate works on the modern history of existing states, has been in continual progress ever since it was started about fourteen years ago. Each particular country being in the hands of an author, who either derives the knowledge of its institutions, or, perhaps, even his acquaintance with the leading statesmen from a personal residence, or from the most intimate connection with them—these works are likely to retain a permanent importance as specimens of conscientious contemporary historiography. Their bias is unquestionably on the side of progress. Yet, nevertheless, the principles of a sound scientific method prevail so far, that the losing side comes in for its full share of objective elucidation in the narrative.

The critical application of the sources, parliamentary and diplomatic, official documents and private letters, printed and manuscript materials, ought to be adhered to, on principle, with the same rigidity as if a period of ancient history were to be reconstructed with the help of some recently discovered inscriptions. The demand for books of political instruction like these, in a country with rising and progressive prospects, is best evidenced by the market they find; not any longer exclusively among scholars, but among a general public, deeply interested in its own destinies and the parallel development of the neighbouring countries.

For our purposes it will be sufficient to refer to the three additions which have been made to the collection in the course of the last twelve months, viz. vols. xv., xvi., and xvii., each of them connected with one of the countries forming the three southern extremities of Europe.

Professor Mendelssohn, the eldest son of the great musician, though still reckoned among the young historians of Germany, has already distinguished himself by a rapid succession of publications, chiefly in connection with the recent history of Germany and Austria, and by a more detailed production in the shape of a biography of Count Capodistria. The late Professor Gervinus, eminent in so many branches of political and æsthetical literature, first drew his attention to the history of modern Greece, which Dr. Mendelssohn himself has visited three times since 1860. It appears from his short introductory remarks, that no works or materials whatever, which have been published on the subject in Greece, Germany, England, France, and even Russia, have escaped his notice. In mentioning them he is fond of adding some short pointed observations on the individual value of these productions, *e. g.* on Tricoupi's, Philimon's, and Finlay's writings. Baron Prokesch-Osten's *Geschichte des Abfalls der Griechen* has been reviewed at large by him in *Sybel's Zeitschrift*, vol. xviii. Our author has a decided talent for gleaning much curious matter, which others who went before him had left untouched. Not satisfied with admission into the record offices at Vienna and Berlin, he owes the opportunity of inspecting some of the most secret documents, both originals and the copies of letters of a more private nature, to the friendly confidence he has met with among the Greeks themselves.

The title of the work, only the first volume of which is now before us, has the fault of promising too much. The narrative does not really begin with the conquest of Constantinople in 1453, but rather with the first symptoms of national insurrection among the Greeks, when Catherine II. was waging her first war against Turkey, which led to the humiliating treaty of Kutshuk Kainardji in 1774. Hence the first chapter of but fifty-eight pages is nothing but a well-sifted and highly readable essay on the degraded condition of the people during their long period of humiliation under the æspotic sway of the Turks, on the rise of their vernacular language and literature, their manners and customs, their popular traditions and religion, on *elephants* and corsairs. In this essay the ingenious but questionable theory of Falmerayer, as to the Slavonic origin of the modern Greeks, is once more refuted, as I thought to be, on historical as well as linguistic grounds.

The main subject, beginning of course with Rhigas, with Ali Pasha of Janina, with Prince Ypsilanti and the Hetaerists, is arranged with great skill over the bulk of the volume. The author writes in a fluent and even fascinating style, so much so that the reader will follow with pleasure and advantage the disclosure of the various nurseries from which the revolution sprang, its increasing relations with the European powers, the politics, whether separate or combined, of the latter, the state of parties, and the first constitutional

attempts of the Greeks themselves. The many extraordinary scenes, once so exciting to the generation which is now fast passing away, are well told. From Mesolonghi and the noble exertions of Lord Byron, which brought on his early death, we accompany the author to the "untoward event," the battle of Navarino, which concludes the volume. The author is stern in his condemnation of the ruinous egotism displayed on various occasions by the Greek rivals, the Philhellenes from the different European countries, or among the leading politicians in Russia, England, France, and Austria. Most important and hitherto unknown details on these points, in the shape of extracts from the diplomatic correspondence preserved at Vienna, are added in the appendix. From the indefatigable activity of the author it is to be expected that he will soon complete, in another volume, the story of the conclusion of the memorable struggle, and sketch as impartially as possible the vicissitudes under which its offspring, the present kingdom of Greece, has hitherto existed.

The first two volumes of Dr. Reuchlin's—a descendant by-the-by of his namesake the great humanist and contemporary of the Reformation—work on Italy, published in 1859 and 1860, have long been without a continuation. They threatened indeed to stop short with the second defeat and abdication of Charles Albert in 1849. For several years the rising of Italy, and the success of a national and united policy in that country, were nowhere so unpopular as in the south of Germany, especially in Württemberg, where Austrian sympathies predominated largely down to the great catastrophe of 1866. The author, a frequent visitor in Turin and Milan, Florence and Rome, and on intimate terms with the chief patriots and statesmen—Cavour, Pallavicino, Ricasoli, and others—hints that his Suabian countrymen used to deride him as the "Cavourle," the little Cavour. However he has always been busy at work with his favourite subject. Two more long residences in Italy, among his best informed and influential friends, have provided him with a great amount of trustworthy matter, probably of more direct value than the average of official state-papers seems to be. After the way had been smoothed by a number of articles in some of the leading newspapers, in several historical and political journals of Germany, Dr. Reuchlin has given us at last a new instalment of his work. The stout volume contains hardly more than another decade, in which, moreover, Naples and Sicily are for the present omitted. Upper and Central Italy and Piedmont appear in the foreground. The new gathering of strength for a single great object, Cavour's first ministry, his coalition with the Emperor Napoleon, the war of the year 1859, the treaty of Villafranca, the condition of Modena and Parma, of the Papal States and Tuscany, and the severe crisis which led in January of the following year to Cavour's second and last government,—all these subjects are treated in succession most circumstantially, but in intimate connection with each other. The author promises to relate, in a fourth volume, the end of the Bourbons in Naples, and the first epoch of the Italian kingdom down to the autumn of 1866, trusting "that by the fall of Napoleon many an Italian mouth will be unlocked." Unfortunately Dr. Reuchlin is a rather heavy and clumsy writer, so much so, that his great advantages are to a certain extent neutralized by a certain incapacity of arranging his materials. In spite of the author's good humour and great affection for the prosperity of Italy, the reader cannot help wishing that so much excellent instruction had been given him in the plainest and most natural manner possible. Of course the usual difficulties of the historian are considerably increased by the politics of a country, which, until very recently, had many separate

centres of public life, which at all times were powerfully influenced from abroad. Even the peculiar nature of diplomacy, which in that country is so often akin to conspiracy, requires from an historian more than common literary power. But, nevertheless, though the author will not find many patient readers to peruse his book from beginning to end, he has provided the student and the politician with an admirable store-house for the period in question, full of the soundest information, and based upon an amount of reading among the most out-of-the-way papers, journals, and pamphlets, which very few other friends of Italy can have acquired to the same extent.

Professor Baumgarten had published a remarkable book on Spain, at the time of the French Revolution, before he undertook his present work, which, as many will agree, may be designated as the very best of the collection. In his second volume he narrated the events down to the year 1825, when the absolute government of Ferdinand VII. had been restored by the help of the French, but at the cost of nearly all the colonies and of the vital organs of the state itself. Besides the printed literature in the respective European languages, the author had the dispatches written from the Court of Madrid by the Prussian diplomatic residents at his disposal, and spent part of the year 1868 in Spain. He could thus observe with his own eyes certain changes for the better, which the country is unquestionably undergoing since 1820; and he, moreover, derived inestimable information from politicians and literary men, who were active either at the time or had been so at an earlier period. On the other hand, it is not to be wondered at, that the Spanish Record Office, under the Narvaez government, was closed against him. All short-comings, however, with regard to materials—a complaint most characteristic of Spanish affairs in general, witness the writings of the late Mr. Richard Ford—are most agreeably compensated by the good taste, finished style, and straightforward judgment, in which Dr. Baumgarten's work excels.

The third and last volume, which we wish most especially to recommend, treats mainly of the sad and tumultuous events which the Spanish nation had to endure between 1825 and 1840. Through a wilderness of apostolic conspiracies and liberal pronunciamientos, we accompany the most despicable Bourbon king to his wretched end, which was the signal for the outbreak of a war disastrous beyond comparison, civil and dynastic at the same time, an ordeal in which the old and the new elements to all appearance annihilated each other. Approaching the subject with somewhat of doubtfulness, we must confess that we never have read a more attractive account of the struggle between the Carlists and Christinos, the monotonous cruelty and ineffective results of which seem hardly worthy of the labours bestowed upon them by a conscientious historian. Yet the reader will soon accord the same praise to the five chapters in which the Basques are introduced with their ancient fueros and most primitive institutions. It is only such a race that can produce a party leader and military genius like Zumalacarrégui, by whose extraordinary discipline and example the cause of Don Carlos was chiefly supported through the successive campaigns of seven years. The awful trial of strength, which amid the listless attention of Europe or with the hesitating help of some few governments like the English Whig Cabinet, was ultimately decided in favour of Isabella II. and her mother, did not issue merely in a negative solution. Our author now and then very adroitly uplifts the veil for a view both retrospective and prospective. In his opinion King Ferdinand himself, on his return from captivity in 1814, destroyed most culpably the very conditions of Roman Catholic monarchy

in a country which before all others has ever been founded on orthodoxy and royalism. During the period of the civil war whatever had been left of old Spain was swept entirely away, whilst the resuscitation of a new national and political life has met with more checks than prospering chances. Don Carlos, as our author intimates, rushed inevitably on his ruin, owing to "the perversity of his principles and aims, and their glaring incompatibility, not only with the civilization of Europe, but with any other possible prospect for Spain."

After bringing down his narrative to Cabrera's capitulation in 1840 (in which, by-the-by, as a young military adventurer, one of the heroes of 1870-71—General von Goeben—was involved), Dr. Baumgarten in another chapter sketches the course of national development during the last thirty years. He shows no mercy either to the Moderados or the Progresistas, because neither of them allowed Spain to right herself by the expression of the free will of the nation. He condemns Espartero because he wielded his thoroughly despotic sword, however necessary it had become, not only without any genius whatever, but chiefly as the mere head of a party. By his fall in 1843, argues Washington Irving, then American Minister at Madrid, the degraded country was saved from the last state of anarchy. But what have the interminable changes led to after all? In fact, there have since been only two governments of any duration, those of Narvaez and O'Donnell, both of which, in spite of their reactionary and intolerant tendencies, had to succumb ultimately to the hostility of the camarilla and the court clergy. The result of the revolution of 1856 has been a comparatively quiet and prosperous period, till the year 1863 brought a return of the former chaos. R. PAULI.

**The Pope of Rome and the Popes of the Oriental Orthodox Church.**  
By the Rev. C. Tondini, Barnabite. Longmans, 1871.

THE object of Father Tondini's book is professedly controversial. He desires to contrast the practical working of the principle of "monarchy," as exhibited in the Roman papacy, with the patriarchal or episcopal government of the Oriental and especially of the Russian Church, which he regards as the one essential difference between the two communions. For we are glad to observe that, in common with many leading theologians on both sides, and with the recent Munich Congress, he is fully convinced "that the much vexed question of the *Filioque* concerns terminology rather than dogma, and is susceptible of an amicable solution. The main design of his argument is to show that "the Oriental Orthodox Church is divided into several separate and independent *papacies*," and that the actual result is a system as purely Erastian as that under which the Church of England is administered. But, while the author's aim is controversial, it is fair to say that his argument is based on a careful analysis of facts, derived from original sources, which are here for the first time brought together within so small a compass. And the facts have an importance of their own, apart from the theological merits of the argument they are intended to subserve. The increased interest felt in the subject of late years in this country, which found expression in the warm welcome accorded to the Greek Archbishop of Syra, gives additional value to such a collection of statistics. And it is chiefly to this aspect of the work that we are anxious to direct the attention of our readers; who will be able to draw from the facts their own conclusions, which may or may not symbolize in all respects with that of the author.

The principal divisions of the Oriental Church were the Russian, under the government of the "Holy Synod" of

St. Petersburg; the four patriarchates of Constantinople, Alexandria, Antioch, and Jerusalem, and the Greek Church proper, ruled, since 1833, by the Synod of Athens; its members numbering in all about eighty millions, of whom fifty-six millions belong to the Russian Church. Practically therefore the chief interest centres in the Russian Church, though it is the youngest of the Orthodox communities, and is now wholly independent of the primatial see of Constantinople, as well from its numerical preponderance as because the Czar stands in the same sort of political relation to the Orthodox Church generally as the French sovereigns during the last few centuries have assumed towards Catholicism. But while in theory the episcopate under the four patriarchs form the governing body of the Orthodox Church in Russia, since the reforms of Peter the Great this principle has been virtually superseded. Peter, of his own authority, and not without some remonstrance on the part of his clergy, by an ukase of Jan. 25, 1721, abolished the patriarchate of Moscow, which had been established with the sanction of the four ancient patriarchs of the East, and substituted for it, as the supreme legislative and judicial tribunal for the whole Russian Church, a synod of twelve members, only three of whom were bishops, the remaining nine being made up by three archimandrites, three hegoumens, and three protopopes—all simple priests. Catherine II. limited the number to six, and through later modifications it now consists entirely of bishops, except that the Czar's confessor and the head chaplain of the army and navy are *ex officio* members. But the Synod, however composed, represents not the inherent authority of the episcopate, but the delegated authority of the Czar, just as the Judicial Committee represents the English Sovereign. As the legal code expresses it, "the imperial authority acts in the administration of the Church by means of the Most Holy Governing Synod appointed by it." An elaborate oath is exacted of the members of this "spiritual college," binding them to unconditional submission to the Czar, and to the obligation of promoting his service and interests to the utmost of their power—not unlike the oath required of Catholic bishops to promote the *Regalia Sancti Petri*—and also containing an express acknowledgment that the Czar is "the supreme judge of this spiritual college." The Czar therefore exercises the same supreme jurisdiction over the Russian which the Pope exercises over the Western Church, but, as he makes no claim to infallibility, his *doctrinal* power is allowed by Father Tondini to be strictly limited by the dogmatic canons of the ancient Councils; the *disciplinary* canons he can alter or abrogate at pleasure. As it is expressed by Schnitzler, a writer quoted with respect by our author: "S'il s'agissait d'être juge dans un débat sur des matières de doctrine, l'Empereur renverrait l'affaire au Saint Synode ou réunirait un Synode spécial, et dans un cas majeur il enverrait prendre l'avis des quatre Patriarches d'Orient. Il ne se réserverait à lui-même directement que l'exécution de la décision rendue, de la sentence prononcée." The author hardly appears to appreciate the full force of this distinction when he describes the supremacy of the Czar as in all respects equal with that claimed by the Popes, at least in view of the recent Vatican decrees. However the Czars formally style themselves, "Heads of the Church," and every Russian bishop is obliged to present annual reports to the Governing Synod of the state of his diocese, as Roman Catholic bishops are bound every three years for a similar purpose to visit the *limina apostolorum*. That the Czar should have the absolute appointment of all the bishops does not seem a very important distinction. Catholic sovereigns and governments exercise the same right wherever the Church is in any sense established, and even the Protestant king of Prussia

has an absolute veto on any nominee who is not a *persona grata* to himself. It is more strange that Russian priests should be ordered to reveal any treasonable plot disclosed in confession, and that on the ground of our Lord's injunction (Matt. xviii. 17), "Tell it to the Church." The state of things in Turkey and Greece is not substantially different. The Synod of Nauplia, composed of all the Greek bishops, in 1833 acknowledged the King as the supreme head (*ἀρχηγός*) of the Hellenic Church, where, however, he interferes much less than the Czar does in Russia. The Sultan appoints and can depose the four Patriarchs of the Byzantine Church, and to him, according to the Encyclical issued by them in 1848, are referred such "extraordinary and difficult questions" as they cannot settle among themselves. So far the author must be held to have made out his case, that in none of the three principal branches of the Oriental Church do the bishops really constitute, as according to orthodox doctrine they ought to constitute, the supreme authority.

It is also, we think, clearly made out that the various branches of the Orthodox Communion have no such external and governmental unity as exists under the jurisdiction of the Papacy. But when the author ridicules the complaint of Greek theologians, that "the doctrine of a visible head of the Church destroys her unity," he seems to us hardly to have grasped the point of the criticism. What they mean is probably, what some high Catholic authorities and some popes have themselves admitted or affirmed, that the centralising policy of the mediaeval popes contributed materially to bring about and perpetuate the separation of East and West, and this view is confirmed by Tondini's avowed conviction that the difference hinges exclusively on the form of Church government. We cannot enter here on the wide and much vexed question of ecclesiastical "jurisdiction," about which various opinions have been advocated by Catholic theologians, who are by no means agreed in regarding the divinely ordained government of the Church as a pure monarchy. Lacordaire, for instance, insists on its combining and harmonizing the three typical forms of government, monarchy, aristocracy, and democracy. Nor does history altogether bear out the assertion of the "patent fact" that the extreme claims of papal prerogative are the surest if not sole guarantee for the authority and independence of the episcopate. Certainly very opposite statements were made by many bishops at the Vatican Council. But the real interest of Tondini's book lies, as we said before, not in his theological opinions or even in his controversial application of the argument, but in the mass of statistics not generally accessible which he has collected in a brief and readable volume. For controversial purposes it should be read in connection with such works as *Janus* or Schulte's *Die Stellung von Concilien, Päbsten und Bischöfen*.

H. N. OXENHAM.

### *Intelligence and Contents of the Journals.*

M. Michelet has begun a continuation of his great history under the title of *Directoire—Origine des Bonaparte*. There are some curious details on the mode in which Bonaparte was enabled to obtain the necessary supplies for the army of Italy in 1795. The author's main object, however, is to describe the growth of the "military system" and its long struggle with the "industrial systems" of England. The preface contains some notices of his own life, and it is needless to say of Michelet that his aversion to England still displays itself vividly and is sometimes extremely absurd.

*Literarisches Centralblatt*, March 16.—Notices the publication of Conrad Justinger's *Chronicle of Berne*, one of a series of old Swiss chronicles now being critically edited; and the conclusion of Rossbach's *Geschichte der Gesellschaft*, the 4th part contains the history of the rise of the Middle Classes, especial attention being devoted to England.—March 30.—Notices Paul Meyer's *Les derniers Troubadours de la Pro-*

vence and the *Vie de S. Alexis*, both valuable for French philology.—April 13.—Notices the concluding volumes of Winter's *History of the Cistercians in North East Germany*, and criticizes unfavourably Klippel's *Life of General von Scharnhorst*.—April 20.—Reviews Tourtal's *Dispatches of Ridolfi*. Ridolfi was Florentine Resident at the Imperial Court during the Diet at Ratisbon in 1641, but we get little new information from him.

*The Growth of the English Constitution from the Earliest Times*, by E. A. Freeman, contains the substance of some lectures delivered at Leeds and Bradford. Mr. Freeman's object is to give in a popular form the results of his researches into our early history, and stress is laid on two favourite ideas—that of the continuity of our history, and that of the revival in later times of early institutions which had perished after the Conquest. The unwritten rules of our constitutional law are also considered, and it is shown how important they have tended to become of late. Every one knows that in theory the prerogatives of the Crown are as great as ever, while practically the real power is in other hands. The error of many writers on the constitution has been that they have looked merely to the outward forms and not regarded the living forces that act through those forms.—We should notice also Mr. Freeman's address as President of the Somersetshire Archaeological Society, in which he shows the importance of connecting local enquiries with the general history of the country. We might point to his own account of York and Exeter and Lincoln, in the 4th volume of the *Conquest*, as illustrating his meaning. Similarly in an address to the Historical Section of the Archaeological Institute, at its annual meeting held this time at Cardiff, he illustrates from local knowledge the succession of races in Great Britain, the fusion of which has made the English nation.

*Altpreussische Monatsschrift*, February-March.—Contains an account of the MSS. illustrating the history of "Preussen" (Prussia in the narrower sense) in Prince Czartoryski's Library at Paris; a document of the Teutonic order in 1316—one of our earliest original documents in German; a full account of the tumuli opened in the district (Wulfstan's report to King Alfred is the earliest description we have of the mode of interment among these tribes), which is worth comparing with Canon Greenwell's explorations in Yorkshire; some extracts from unprinted Russian chronicles; and a notice of the original MS. of Copernicus' *De Revolutionibus Orbium Coelestium*.

The newly discovered fragment of John of Antioch, published by Mommsen (*Hermes*, vi. p. 322 ff.), from Professor Geppert's transcript of the MS. in the Escorial, contains an account of the death of Odoacer after his surrender to Theodoric, confirming a previous conjecture on the subject by Professor Felix Dahn, who announces his intention of shortly discussing the whole passage. Ten days after the capitulation, Theodoric sent for Odoacer to his palace; as he entered, two men seized his hands as if about to make a request; this was to be the signal for assassins from the next room to enter, but their resolution failing, Theodoric himself ran his rival through with his sword, exclaiming as he withdrew it, "the wretch (vô rakor) had not even a bone in his body." Odoacer's widow, "Sunigilt," was starved to death in prison, and their son, Thila, put to death on his return from banishment.

The 17th volume of the *Transactions of the South Slavonic Academy* (*Rad Akademije Jugoslavenske*) contains an interesting dissertation of Dr. Racki on the origins of the Croatian kingdom; and the second part of Prof. Tagic's study upon the Progress of Slavonic philology in the last years. Prof. Tagic has been recently appointed by the Russian government Professor of Philology at the University of Odessa.

*Theolog. Literaturblatt*, March 12.—Notices the conclusion of Caravita's *I Codici e le Arte a Monte Cassino*.—A. von Reumont has a very full account of Adolf Trendelenberg's *Kleine Schriften*, especially as regards the account of Machiavelli and his object in writing *The Prince*.

### Philology.

*Scenicae Romanorum Poesis Fragmenta secundis curis recensuit* Otto Ribbeck. Vol. I. Tragicorum Fragmenta. Leipzig: Teubner, 1871.

THAT a second edition of the fragments of Latin tragic poetry should appear within twenty years of the first is another indication of the increasing attention which the early literature of Rome is still attracting to itself, indeed a very strong one; for, as poetry, these remains are so slight, and, as compared with the corresponding fragments of the Greek tragedians, so poor and inartistic, that the reader of them, even when helped by the lucid arrangement and beautiful typography of the edition before us, is obliged to summon to his aid all the adventitious interests of a yet new subject to carry him through the volume. With this admission, this new edition of the *Fragmenta Tragicorum* may be considered an interesting, as it is beyond doubt a very valuable, accession to our knowledge of early Roman literature; and it may perhaps be said that the light which these fragments throw on Latin philology alone is enough to compensate for their tediousness as poetry. Add to this the palæographical interest of disentangling the more and more resolvable perplexities of the authors by whom they are quoted, and the gradually increasing conviction which the careful study of those authors produces, that much which at first seems doubtful or insoluble in these venerable remains may, and probably will, find a clear and almost certain solution in the hands of the carefully trained scholars of the present generation. This is especially true of Nonius, the largest contributor to the collection, but it is likely to be more true than it is as yet of Varro, Festus, and the Grammarians; and we can hardly fail to see why it is that works like this command a steady sale, and pass rapidly into a second and third edition. There is besides the eminently German (it can hardly be said to be an English) virtue of working up all the available materials which the industry of ancient and modern scholars places within the editor's reach; M. Ribbeck's second edition in this respect is a proof of the goodness of his first. In the nineteen years

which have elapsed since the work was originally published, the most eminent scholars of Germany, Ritschl, Bergk, Mommsen, Haupt, Fleckeisen, Bücheler, Corssen, and a host of others, have either themselves emended the fragments or contributed new facts or statements which help to elucidate them. It is sad to find few or no English names, only one or two French, among them: yet we venture to think that Latin philology has received a new impulse among us, and almost hope that, if a third edition shall, as is very likely, ever be forthcoming, it will contain at least some English contributions of consideration.

The present edition differs from the first mainly in two points, its increased bulk and the absence of any discussion as to the place of the fragments in the dramas to which they belonged. Ribbeck reserves this for a separate volume; but it is to be hoped that where plausibility is all that can be looked for, he will allow the temperate and rarely extravagant views which the essay in his first edition contains to remain substantially as they were. He has followed this course consistently in retaining the fragments in the same order and numbering as in the first edition; a saving of time of incalculable value to the student, and which, as a principle of economy, is worth a great deal. By way, however, of supplementing his book, M. Ribbeck has prefixed a Corollarium of lxxviii pages containing a further discussion of the more doubtful fragments, with the suggestions of Bücheler, Usener, and Adolf Kiessling; some of these seem to bear marks of haste, though they add no doubt to the interest of the book: generally the results of the Corollarium are to leave undecided what was undecided before.

Nor is it possible to speak with entire satisfaction of the conclusions at which M. Ribbeck has arrived in constituting his text. It is true that the apparatus, which is at once clear and full, enables any one who will take the trouble to form his own conclusions on the data furnished by the MSS.; and it is equally true that where new words are inserted to satisfy the demands of the metre, these words are distinguished by brackets from the rest. Nor can it be denied that the large proportion of undoubted senarii and septenarii justifies the preference which in common with most editors M. Ribbeck shows for those metres; and the restitutions which he has effected on this hypothesis are not few, and in some cases, we think, beyond dispute. Yet there are places where the MSS. point as unequivocally to other rhythms, bacchiac, cretic, or, as in spite of M. Ribbeck we must think, saturnian. We shall give specimens of each, beginning with the last. Nonius gives a line from the *Ajax* of Livius Andronicus thus—

*Præstatúr virtútí laús; gelú set múlto  
Ocíus uenío tabescit,*

i.e. probably—

*Ócúus uento . . . tabescit,*

a passage which seems clear enough to justify the inference that the early writers for the stage mixed saturnians with the other exotic rhythms. Att. 558, *heu Mulciber Arma ignauo inuicta es fabricatus manu*, is reduced by Hermann to senarii by inserting *ergo* after *arma*. It is easier to suppose them cretics. The line from Ennius' *Iliona*, fr. iv. Ribb.—

*Age asta, mane audi, ítera dum eadem istaec mihí,*

must be, as Fleckeisen constitutes it, bacchiac; and this is, if I am right in so conjecturing, the metre of part of a much disputed passage quoted by Nonius, 407, 22, in illustration of *tenacia*. It is written in the MSS. as follows: *ducet quadru-  
pedum iugo inuictam doma infrena et iuge valida quorum  
tenacia infrenari minis*, i.e.—

*duc et quadrupedem iugo,*

*Inuictam doma infrena et iuge,*

*Valet equorum tenacia infrenari minis.*

The first of these verses is either a short trochaic line or the end of a longer iambic or trochaic verse; the second is composed of three bacchii; the third is apparently cretic, if we may suppose the two last syllables of *tenacia* slurred into one, or for *infrenari* read *frenari*. Another passage in Nonius from the *Lycurgus* of Naevius, which runs as follows: *nam ut ludere lactantis inter se uidimus practer amnem creterris sumere aquam ex fonte*, and is given by M. Ribbeck as trochaic—

*Namque ludere ut lactantis inter sese uidimus*

*Propter amnem, aquam creterris sumere ex fonte . . .*

more naturally divides into two bacchii with an anacrusis—  
*nam ut ludere*

*Lae | tantis interse uidimus practer amnem*

*Cre | terris sumere aquam ex fonte;*

and the same metre is perhaps traceable in a fragment of the *Neoptolemus* of Attius, i. Ribb. Nonius gives it as follows: *quid si ex Graecia omne illum par nemo reperiri potest*, which M. Ribbeck reduces to iambic senarii—

*quid si ex Graecia*

*Omni illius par nemo reperiri potest?*

but which is with less violence written—

*quid si ex Grae | cia*

*Omni illum par nemo reperiri potest?*

where *illum* for *illorum* is an old conj. of Voss, and suits the passage grammatically as well as *illius*. It is no doubt an indication of the difficulty of settling such metrical points that a line which bears on its front so clear an impress as—

*Quamquam annisque et aetate hoc corpus putret* (Pac. 340)

was at first considered by M. Ribbeck to be a truncated senarius, and that Ritschl, who determined it to be bacchiac, as it surely must be, arranged it by the help of the newly revived *d* (*aetated*) as possibly also a senarius.

This brings us to a further point of criticism. Ritschl's lately published pamphlet on the final *d* has had more than what we consider a desirable influence on the editor of the fragments. After all Ritschl's arguments we still look upon the introduction of this final *d*, whether abl. or acc., with distrust. It is worth while to examine this with some minuteness, and we therefore write out at length such of the lines in which this final *d* is reintroduced, as far as we have at present examined, in M. Ribbeck's volume.

Liv. 26. *Ego puerum interea ancillae subdam lactantem meae.*

Ribb. *interead*; in his first edition he supposed a syllable lost at the beginning of the line; metrically this is less harsh; *interead* not only makes a singularly unrhythmical line, but is without any MS. support.

Pac. 39. *Qui se icit quam illum cumpse lapidem, qui ipsa icta est, petit.*

*Sed* for *se*, Ritschl: yet *se* is very often written for *sese* in the MSS. of Nonius, and so Voss here, and Ribb. in his first edition.

Pac. 150. *Sed ne incertat dictio: quam rem expedi.*

*Med* for *ne*, Bothe; but *ne* is not certainly even *me*, much less *med*: and if it were, we cannot be sure that we have a complete senarius.

Pac. 225. *Quid tandem? ubi ea est? quod receptat? exul incerta uagat.*

*Quod receptat?* Ribb. accepting *quod*, on Ritschl's suggestion, for *quo*: yet even if *receptat*, the conj. of Bergk, is

right, confusions of *quo* and *quod* are too constant to make any argument in defence of a final *d* derived from this passage of weight.

Pac. 237. *Qua super se interfectum esse Hippotem dixisti.*

Ribb. reads *sed*, and inserts *tu* before *esse*, inverting the position of *Hippotem* and *dixisti*. Little as we can approve of L. Müller's—

*Qua super se interfectum esse dixisti Hippotem,*

we approve as little of M. Ribbeck's *sed*. The line seems to be, as M. Ribbeck himself thought in his first edition, a cretic tetrameter, reading *dixiti Hippotem*.

Pac. 248. *Pariter te esse erga illum uideo ut illum te (ted, Ribb.) erga scio.*

315. *Postquam defessus perrogitando (-dod, Ribb.) aduenas.*

These two cases are to some extent on a level; the insertion of the final *d* is an easy, even a natural, expedient; very probably it was so written by Pacuvius: at any rate, *te erga* is impossible, even if *perrogitando* is allowed to stand as a hiatus. Yet other hypotheses are also possible, e.g. *te erga rescio, perrogitando st*, or even as Umpfenbach and Bücheler: at any rate no one can say that these instances, and they are the strongest we have met with, *prove* the final *d* in the Latin Tragic. Equally disputable are other archaisms introduced without necessity, e.g. *quamde* in Att. 267—

*Melius pigrasse quam properasse est nefas;*

where *quam* is perhaps a corruption of *quando* or *quoniam*; *Iumpis*, Pac. 244, for the MS. *lymphis*: not that such forms may not be orthographically correct for the time of Pacuvius; but that M. Ribbeck's work ought to speak authoritatively, and authority in such cases is incompatible with anything like considerable deviation from the MSS. On the same principle M. Ribbeck, we should have thought, would have done better in retaining what look like remnants of ancient constructions. Thus in Pacuv. 330, *qui tibi in tutela est traditus* is quite archaic, like Cato's *ponere, condere*, &c. with *in* and an ablative; cf. Virgil's *Mandet humo solita*; and so in Att. 494—

*Cum somno in segetem agrestis cornutos cident,*

the simple abl. *somno* should have been kept, even if Catullus' *fallaci excita somno* is not enough to defend it. Again, why should *super satis agere*, Pac. 72, be altered into *semper satis a*, when the combination *satis superque* recurs so often? or the substantival infinitive, *Concertare ac dissentire partem da(t) cursum aequiter*, "to dispute and disagree in part (? that part should dispute and disagree) gives free course on both sides," be tortured into—

*Concertare ac dissentire parti ac da cursum aequiter?*

In the immediately following passage, Pac. 75, may not the MSS. reading *domitum imperium*, "the tyranny to which they are broken in," be right? and in Pac. 102—

*Ossuum inhumatum aestuosam auram,*

does not *auram*, "vapour," suit the sense better than *aulam*, "a pot"? It may be said that in Pac. 114, *hymenaeum fremunt Aequales, aura resonit crepitu musico*, Euripides—

Ἀργεῖαί τε νῦν  
ἡμνοῦσιν ἡμεναίοισιν ἀδλεῖται δὲ πᾶν  
μέλαθρον (J. T. 355),

points to *aula* (Scaliger) as a more than probable correction; still the four words of the former fragment ought to be judged by themselves; a principle, we think, scarcely estimated at its full value by M. Ribbeck. In Pac. 161-3—

quo tamen (? quo iam me) ipsa orbitas  
Grandaeuitasque Pelci per penuriam  
Stirpis subaxit,

where Ribb. reads *penuriam, subauxit*, it may be a question

whether *subaxit* = *subegerit* is not more in conformity with *per penuriam*: particularly as *subaugere* seems to have no existence. In Pac. 194—

*Sed haec cluentur hospitum infidissimi,*

where L. Müller proposes *haec* = *hi*; it seems more likely that *haec*, "these parts," is genuine.

In the well-known fragment from the *Iliona* (197-201), *suspense somno*, the reading of the best MSS. is in complete accordance with the language of other writers; sleep as a god is represented as hovering lightly over the sleeper, or transferred to a state of somnolence, the same word naturally passes into the idea of a light sleep, ready, so to speak, to take wing with the least disturbance. In 200, where the MSS. give *neu relliquias semiassi reis denudatis ossibus*, after Haupt's obviously true emendation, *sireis*, there can be little doubt that the whole line ran, as Bentley in part suggested—

*Neu relliquias semiassi sireis denud. ossibus.*

Another fragment of the same play—

*Fac ut coepisti hanc operam mihi des perpetem, oculis traxerim,*

is, with the change of *coepsti*, too good a verse to be altered: *oculis traxerim* would seem to mean, "let me drink it in with my eyes," like *haurire oculis*, &c.

Enn. Eum. 132—

*Tacere opino esse optimum et pro viribus  
Sapere atque fabulari tute noueris,*

needs only an *ut* before *tute* to make the sense intelligible: "I consider it best to be silent, and to show such wisdom as one can, and only to speak in accordance with one's own knowledge."

Enn. 360—

*Animus aeger semper errat, neque pati neque perpeti  
Potest,*

*pati*, not *poti*, must be right: "it can neither bear nor bear out."

These remarks are offered with profound deference to the eminent scholar whose contributions to Latin philology are so well known and so undeniable. In works like that before us the method may be said to be half the battle; and M. Ribbeck's editions of the Latin Tragic and Comic fragments were among the earliest specimens of that distinct arrangement of text, authorities, and critical apparatus, which has since become *de règle*. If we have ventured to question some of the conclusions of this new edition of the Tragic fragments, it is with a deep sense of the immense profit which every careful reader must derive from its learning and research, the felicitousness, nay certainty, of many of its emendations, in a word the impress of thoroughness and mastery which it displays throughout. In such men doubts mean so much that they are almost better than other people's certainties: that M. Ribbeck's second thoughts seem sometimes less probable than his first is a sure indication of the progress, to which no one has contributed so largely as himself, of the study in its multifarious departments of Latin philology.

R. ELLIS.

#### THE MANUFACTURE OF INSCRIPTIONS.

THE pretended discovery of "another Moabite stone," purporting to be set up by Moses in honour of himself, was published by Mr. Lumley in the *Times* one day, and contradicted by him the next. It was at once pointed out to him that the monument in question had already been published and philologically explained in the Quarterly Statement No. VI. of the Palestine Fund (1870), and *Zeitsch. d. d. morg. Gesellschaft*, 1871, p. 429, &c. But how are we to account for the differences between that simple Nabataean sepulchral inscription, which no doubt has not been copied with perfect accuracy, and the copy brought home by Mr. Lumley, but deciphered in utter contempt of philological

principles? It is obvious that only one stone with such an inscription can be in existence; and not less so, that if it was found in Umm-er-resās (and this is quite certain), the same inscription cannot have come to light in Medeba, a place which is certainly a good distance off. But there is another point equally certain, viz. the original identity of the characters of both the inscriptions. We only find some slight alterations in the form, and the mode of connecting and separating single characters. We also find the characters distributed in six lines in the new copy, whereas the genuine monument presents only four lines. A copy revised in accordance with the original one of Bechnam has only a few indistinct marks on a fifth line. But when Shapira's explanation of the stone is exploded, we naturally ask, whence comes the stone seen by Mr. Lumley at Shapira's house, 36 inches by 18, close granite, with a six lines' inscription? Clearly there is a monument in existence, manufactured probably by Shapira as an article of trade. A clever fraud for Jerusalem, but clumsy enough for any one who knows inscriptions! There is no misunderstanding here, as some might be inclined to think, for this is not the only suspicious inscription which has passed through the hands of Shapira. When M. Ganneau lately discovered a stele with a Greek inscription, forbidding non-Israelites to enter the inner court of the temple, and thus harmonizing beautifully with Josephus, Shapira soon afterwards produced a similar though smaller stone of the same purport, which was asserted to have been found on the same spot. He refused however to allow a "squeeze" to be taken on account of pending negotiations for its sale. A third stone in the possession of the same man is much more suspicious. The characters are said to agree with those of the stone of Mesha—and of course it is quite possible that other stones of the kind exist—but we are told that, according to Shapira, the Beduin, who is said to have brought the stone, refused to mention the place of its discovery. The monument, which is 2½ feet long, 1½ foot broad, and 8 inches thick, contains four lines with 86 letters. The first three lines are said to contain the 117th Psalm. As if psalms were ever engraved on stone! Our own thoroughly trustworthy correspondent writes: "I have already had people in Jerusalem pointed out to me who know about the manufacture of this stone. The characters have been well scratched in; but the stone has lain in a kind of lye, so as to get an antique appearance." Lately, too, I received two more "squeezes" of newly discovered Nabataean inscriptions. On examination, the one (you can see traces of the stone on it!) which passed through Shapira's hands stands in the same relation to the genuine inscription as his copy from Medeba to the genuine inscription of Umm-er-resās.

These facts seem to establish the existence of a flourishing manufactory of inscriptions in Jerusalem. Whether Shapira is the only partner in the concern or not is uncertain; but we feel bound to address a warning to scholars, and particularly to travellers in Palestine. Mr. Lumley is not the only person who has been deluded by Shapira, for a letter from Jerusalem in the *Athenæum* for March 9 refers apparently to several of his forgeries as "very interesting and valuable inscriptions." Being personally acquainted with Shapira, we can state that he embraced Christianity from purely sordid motives. His character is just suited for a forger of inscriptions, as also his half-scholarship and his Jewish-German. The want of tact exhibited in various quarters in the tragic history of the Moabite stone begins to bear fruit. Beduins go in quest of inscriptions; then pashas extort them from them out of avarice, and play the part of harem-guardians of Semitic monuments; and the last result is now before us—the convenient though clumsy system of forgery.

ALBERT SOCIN.

### Intelligence.

The well-known traveller Captain Burton feels called upon to correct some omissions and misstatements in the current accounts of the Moabite stone. In the *Athenæum*, April 13, he gives a *résumé* of the palaeographical, linguistic, and historical peculiarities of the inscription, and flings an undeserved taunt at the scanty band of English scholars. He boldly asserts that "short vowel-points appear in parts of the inscription," and that, among other "shades of meaning" (1) there is a dual termination *-im*, and a plural *-an*; refers Isa. xiv. and xv., "the so-called Isaiahic writings," to the reigns of Uzziah, Ahaz, and Hezekiah; and contemptuously dismisses the historically important narrative in 2 Kings iii. His second paper (*Athenæum*, April 20) opens with a list of articles, &c., on the inscription, which, except its

incomplete supplement, is borrowed without acknowledgment from Dr. Wright. The author then examines one by one the statements of Dr. Petermann in the German Oriental *Zeitschrift* for 1870 with a fullness and authority which would carry conviction were it not for his undisguised anti-German bias. Both articles are full of misprints. We have to thank the author for the information that M. Ganneau is quite willing to part with the stone, but that complications have arisen with the Comte de Vogüé.

A new work, by Dr. Richard Volkmann, on the rhetorical systems of the Greeks and Romans (Berlin: Ebeling and Plahn), contains an exhaustive collection of the material furnished by the Greek and Roman rhetoricians, Aristotle, Cornificius, Cicero, and Quintilian, also the grammarians and scholiasts, their precepts being illustrated by numerous examples from the Attic orators and Cicero. The work endeavours to show that the rhetoric of the ancients is not an arbitrary *olla podrida* of absurd and pedantic rules, but a thoughtful and refined structure of great perspicuity, and which may be of importance even to our own time. Another publication of the same firm is an essay by the younger Kinkel, *On Euripides' Relation to Art*.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 48.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The next number will be published on Saturday, June 1, and Advertisements should be sent in by May 28.*

## General Literature.

A. Sainte-Beuve. *Souvenirs et Indiscretions*. Paris : Michel Lévy Frères.

A. Sainte-Beuve. *Nouveaux Lundis*. Tome troisième.

THERE is something pitiful about these two scrappy volumes, a sort of impression of the gleanings of grapes when the vintage is done. Of course the deplorable circumstances make the temptation to book-making irresistible; and even apart from the two fragments of autobiography which appear in both, the two volumes contain much, both in the way of remains and of anecdote, which was too good to be wasted, and the time has not come for a life of Sainte-Beuve in which such materials might have been used without suggesting the suspicion that they were being traded upon.

Sainte-Beuve was one of the writers who suppress their personality without escaping from it, and therefore we can neither comprehend their writings without a knowledge of their character nor reconstruct the character without needing any help beyond the writings. An adequate life is wanted, but perhaps it may be doubted whether the adequate life can ever be written. His secretary appeals to Sainte-Beuve's correspondents, but it will surprise few if the appeal produces nothing more interesting than an interchange of diplomatic civilities with a variety of celebrities, with all the expression of opinion coming at the beginning of the series, before the writer had forgotten to feel and learned how to criticise: and then these scanty memorials may tell us very nearly all there is to tell of a great writer, whose character was too guarded to be easily known, perhaps too jealous to be worth knowing. The fact is, he was too important not to be a valuable convert, and he may be said to have passed his life in tantalising those who desired to proselytize him; he could never abandon his intellectual liberty, and he could never resist the fascination of tasting and trying to the uttermost what he never meant to buy. One result of this cruel curiosity is to be traced in the inconsistencies of his great work on *Port-Royal*. Through all the successive revisions, we can still discern what passages belong to the Lausanne lectures, when the subject was still fresh, when the writer was in the full enjoyment of the luxury of being almost persuaded. They stand out in a very marked contrast from the successive layers of erudition which Sainte-Beuve continued to accumulate with admirable diligence long after he had come to regard the ideas of Jansenism somewhat in the light of a squeezed orange. And in what Sainte-Beuve says of himself, and in what his last secretary says of him and does not say, we find the trace of the kind of isolation which is another and an inevitable result of such a career. A man who had been acquainted with all that was best in France had none nearer to him at last than an old college companion whom he had found again after almost losing sight of him for thirty years, and had to

VOL. III.—NO. 48.

apologize to an old friend of Béranger who had known Lisette for the improvised family whom he might meet at his table. After all allowance has been made for differences of manners, there is something depressing in the thought that such a man lived so long in the world without taking root in it, without subduing it, and without really rising above it. Still he was not subdued himself: he was free to the last and laborious to the last, and if he measured his ideal obligations more jealously than could have been wished, it is to be remembered that he acted scrupulously up to his own standard, and that unwearied kindness to individuals, an indefatigable activity in the relief of tangible distress are higher qualities than the capacity for fidelity to a school, or a coterie, or a cause. Material external success is a secondary consideration, but it came at last in a manner not inadequate to Sainte-Beuve's abilities and his heroic industry; it is scarcely worth while to dwell upon a drawback which it is clear, from the two fragments of autobiography, he felt himself. An undiscerning public was ready to leap to the conclusion which ungenerous critics were ready to suggest, that he had been patronised more or less by every one of those whom he had met, and from whom he had parted, whose reputation had been more rapid, perhaps more brilliant, than his own, without being really higher and without being so enduring. His highest success was of course in criticism, and the public were ready again to exaggerate the extent to which he had not succeeded in the line of creative literature. From this point of view, it is interesting to know that five large editions of *La Volupté*, "*toutes réelles*," were actually sold; and that the copyright of the first edition of *Joseph Delorme*, the first work of an unknown writer, was judged worth 600 francs. Perhaps the most interesting biographical matter after the two fragments of autobiography are some letters to the college friend whom Sainte-Beuve found again in the autumn of his days; they date from the early days of Romanticism, and it is curious to see the essential manliness and reasonableness of the writer breaking through the morbid fervour of the school. He must have smiled, and perhaps his correspondent would have smiled too, if they ever re-read a serious exhortation to a man who had, very sensibly, accepted an appointment in a country *Lycée*, to resign himself to his tragical fate, to submit to have had no youth, and no past, and no future. Some light is thrown on two contested passages in Sainte-Beuve's later career: the famous Good Friday dinner, and his migration from the ex-official *Moniteur* to the anti-dynastic *Temps*. It is shown, with almost superfluous completeness, that the first was in no sense a "demonstration;" but the scandal must have been foreseen at least as a possibility, and no doubt the company thought it important not to be hampered by it. Sainte-Beuve was willing to humour a friend who disliked dining with thirteen at table; it seems that he found it less easy to respect a feeling which he regarded as equally superstitious and more influential. The other matter is more perplexing. He had undoubtedly a strong claim upon the *Moniteur*, and the *Moniteur* was singularly indiscreet in showing that it still dragged its chain: opinions will always differ as to whether Sainte-Beuve was justified in the way in which he resented the officious pusillanimity of the editor who suppressed an article on some public lectures which offended the clerical party. It will be easy to deny that his conduct was in any degree disloyal, and hard to maintain that it was exactly generous or delicate.

The fact is, that he was one of heaven's Swiss like General Jomini, welcome and valuable in all camps, at home in none, and therefore exposed to mortifications which they always knew how to resent. There is a sort of fitness in the fact that his last great effort was a rehabilitation of the

famous tactician whose works had become the text-books of the army from which he had been driven; and the completeness with which the writer has succeeded in realising or in seeming to realise what constitutes the merit of a writer on tactics, what constitutes the special merit of Jomini, is one of the most astonishing *tours de force* in literature, especially when we remember that it was performed by a man of nearly seventy, suffering under a painful and incurable disease. On the other hand, we should have been glad to have had some discussion of Napoleon's dictum, that Jomini was a good writer and a bad officer. In general, it may be said that the finished little biographies which were Sainte-Beuve's speciality hardly seem to an English reader to deserve the name of "Studies;" they assume absolutely no knowledge on the part of the reader, though they always start from the fullest knowledge on the part of the writer, consequently the latter from first to last is always in the attitude of imparting information rather than in the attitude of answering questions. It is natural to compare them to Plutarch, and they hardly gain by the comparison: the scientific superiority of the Parisian to the Chaeronean is unquestionable, but so is the inferiority of subject; and on the literary side we have to choose between easy perfection of execution and breadth of treatment and an elevated tone. The article on Joachim du Bellay, one of the poets of the *Pleiad*, has much interest, both of a biographical and a literary kind. Sainte-Beuve claims for him the merit of having first formed a clear conception of the use to which all the French classicists from Racine to Chénier would put ancient literature. Malherbe was a hackneyed subject, and perhaps the paper on him was hardly worth reprinting: its principal merit is the insight with which the writer deplores the misfortune of French poetry in having no continuous tradition. It was originally written in the year of the Italian campaign, the year that Sainte-Beuve received the Grand Cross of the Legion of Honour—at a time when a disinterested critic might have found as many reasons for supporting the empire as Malherbe found for his devotion to Henri IV. and Richelieu. We have one of the first traces of the writer's disenchantment with imperialism in a wonderfully just and stinging sketch of true and spurious Caesars, dashed off as an introduction to an article on the *Vie de César*, which he was vainly pressed to review. As the article was never meant to be completed, the introduction is to be regarded as a *jeu d'esprit*; from this point of view it is hardly a defect that both classes are generalised from a single instance.

G. A. SIMCOX.

#### NORWEGIAN FAIRY-TALES.

**Norwegian Popular Tales**, told by P. Chr. Asbjørnsen. New Collection. [*Norske Folke-Eventyr*, fortalte af P. Chr. Asbjørnsen. Ny Samling.] Christiania: Dybwad, 1871.

**Norwegian Huldre-Tales and Popular Legends**, told by P. Chr. Asbjørnsen. Third Edition. [*Norske Huldre-Eventyr og Folkesagn*, fortalte af P. Chr. Asbjørnsen. Tredje Udgave.] Christiania: Steensballe, 1870.

ONE of the most competent judges of fairy literature, Andersen, began a biographical notice of Peter Christian Asbjørnsen, which he published some years ago in a Copenhagen periodical, with the following words:—

"In the lonely wood with its changeful play of sunbeam and shadow, where the silence is only broken by the patter of the distant waterfall, or the melancholy flute-notes of the thrush, or the ring of the axe as the trees are marked and felled to be carried down by the current to the landing-place; amongst the mountain dairies, where the hills echo to the tones of the reed-pipe, to the pet names of the cattle herded home, and to the joyous laughter of youth; in the block-house where the goodwife sits at the humming spin-wheel through the long winter

evenings, while the skilful husband and his sons carve the useful trifles which are eagerly purchased at distant markets; there, far away to the north, the fragrant flowers of fairy-tale still put forth their shoots. Yet do not think that it is given to every comer to receive a full and pure impression of their simple natural beauty, that, fresh and blooming as they are, he has but to stretch out a hand and seize them; far otherwise, this tender blossom is a mimosa which closes its petals at the least unfriendly touch. He who would pluck it must have a soul filled with love for nature and the life of the people, an eye which has been touched with the magic salve—no other can so much as see it!—That this is really so, any one may satisfy himself who compares all previous collections of Norwegian fairy-lore with that of Asbjørnsen and Moe, which made its first appearance in 1842, and has not long since been presented to us in a fourth edition. In this collection, and in none of the others, we find the fairy-tale as it still lives in the mouth of the people, and have therefore no difficulty in understanding how this work possesses a significance in Norway which has left profound traces on the best recent literature of that country."

The collection of fairy-tales of which Andersen speaks was received on its first appearance with universal applause, was translated into several languages (into English by Dasent), and made Asbjørnsen's name most favourably known. The present long expected continuation possesses all the merits of the first collection in an equal degree, and will be no less welcome, so that it will no doubt shortly be made accessible to the English public in a translation. Part of it has already been given to the world in the *Yule-træet*, "The Christmas-tree," published by Asbjørnsen in 1850-52 and 1860—23,000 copies of which were sold the first year. All these are now brought together with the addition of new tales, which, continuing the numbers of the old series, reach from 61 to 105. The great majority are identical in substance with the cycles of legendary fiction already met with in and out of Europe, though they present some novel features; but others again are entirely new, so that the whole collection, apart from the charm of the style, offers much promising material for scientific research.

The same may be said of the second of the collections under discussion, the *Huldre-Tales and Popular Legends*. And yet we have not to do here with fairy-tales proper, which are at home everywhere and nowhere, but with legends attached to definite localities, and derived from the special national mythology. Thus the Huldre-tales tell of the Huldre-folk, Norwegian mountain and wood elves, who, however, belong to the same class as the English and Scotch fairies, brownies, daoine shee, good neighbours, &c., so that the same legend is often told in Norway as in England or Scotland. Thus Sir Walter Scott relates in his well-known introduction to the ballad *The Young Tamlane*, how "that a Gallovidian gentleman was one day taking the air near his own house, and was suddenly accosted by a little old man arrayed in green, who gave him to understand that he resided under his habitation, and that he had great reason to complain of a drain or common sewer, which emptied itself directly into his chamber of dais," &c. Quite similar is the complaint of a Norwegian Huldre-man against his neighbour, in the legend given by Asbjørnsen, p. 99, which is also to be met with in Denmark and Germany. So in Henderson's *Notes on the Folk-lore of the Northern Counties of England*, p. 154, there is a legend of the smith of Yarrowfoot, and (p. 158) another from Berwickshire, both of which bear a close resemblance to several passages in the Norwegian (and other) tales; Asbjørnsen, pp. 5, 193, 364. I pass over other instances of the same kind to call attention in general terms to the interest of the matter and the riveting charm of the narration in these *Popular Legends*, qualities especially remarkable in *Skarvene fra Udrøst*, "The Cormorants from Udrøst," "The Three Corbies," &c. The last of these is in the section *Til Havs*, "At Sea," under the title *Makreldorging*, "Mackerel-dredging," as it is on a fishing expedition of this kind that the legend is supposed to be told

by an old fisherman. All the legends are introduced in a frame of similar character, which gives the author an opportunity of representing this or that neighbourhood, this or that class of the Norwegian people, in so clear and attractive and yet so natural and life-like a manner, that the reader feels as if he were actually amongst the woods and mountains of Norway with the *dramatis personae*, as Asbjørnsen's characters may, with literal propriety, be called, for they are really the actors of little dramas, which he sets before the reader with an art that looks like nature. As another Danish writer has remarked, no professional dramatist could show greater skill than he does in preparing the occasions on which his tales as it were introduce themselves. The poet nowhere appears, and yet the work is one of the most richly poetical with which we are acquainted; the descriptions are so varied and many-sided that new pictures are always being disclosed, and one wanders through the whole country hunting and fishing, up to the mountain homesteads, along the streams and through the woods, with companions in whom one seems to recognise old acquaintances, "whether they be huntsmen, or plank-carriers, or gypsies, or highland dairy-maids, or conjurers" (*signe-kiærringer*, literally "spell-women"); in a word, Norwegian nature and the Norwegian people are cast bodily by the poet into a single volume. That this is so appears from the repeated editions of his works, of which each one is more perfect in form than its predecessor. From year to year he penetrates further into the inmost life and nature of those classes of his countrymen who chiefly figure in his works, and from whom he derives the legends there communicated. His official position as ranger of the Norwegian forests is an important assistance to him in this way, as he has to traverse the country every year, visiting now this now that district, not omitting those most remote and inaccessible, so that he only tells and describes what he has seen and experienced in his own person. As long vacation tours, hunting and fishing excursions, and especially summer trips to Norway, are the order of the day in England, we can recommend no better guide and companions than those masterly descriptions of Asbjørnsen of the country and people of Norway; while those who are not able to see with their own eyes may trust instead to his; his glance is indefinitely more penetrating, and sees more justly, than that of all the authors of travels in Norway put together. It would therefore be a very thankworthy undertaking on the part of whoever will make this work accessible to the English public in a translation; the necessary permission would doubtless be readily conceded, and such a work might count upon the best reception and a wide popularity. It is seldom that so many excellent qualities are combined as here.

FELIX LIEBRECHT.

#### LITERARY NOTES.

M. Charles Aubertin, in the *Revue des deux Mondes* (May 1), derives from the correspondence of the Abbé Dubois some interesting details concerning the share of that Figaro-like diplomatist in the negotiations between France and England in 1717-18; from which it appears that, though Dubois was chiefly devoted to his own interest and that of the regent his master, the charge of venality brought against him by Saint-Simon was as inaccurate as many others of that writer's statements, and that his real talent was for administering bribes, though he never succeeded in prevailing on Lord Stanhope to accept the 600,000 livres which he was empowered to offer him at the Hague.

The attempts made during the siege of Paris to establish a system of signals with mirrors and reflected light appear to have

failed only because there was no spot in the city high enough for the rays of light not to be intercepted by the curve of the earth's outline before they had reached a serviceable distance. The recent experiments at Montpellier, directed by M. Le Verrier, seem to promise ultimate success, and an exceedingly simple apparatus is suggested for enabling two bodies of troops to discover each other's whereabouts, and so establish telegraphic communication.

"Novelties in Poetry and Criticism," in *Fraser* for May, is an attempt to hold an equal balance between the poets "generically known" as the "new school" and Mr. Tennyson, with whom the author also classes Mr. Browning, Sir Henry Taylor, George Eliot, and Mr. Lowell, as possessing more or less truly classical virtue. He points out that the "new school" is only held together by certain principles of art criticism, and that the poetical merits of Messrs. Rossetti, Morris, and Swinburne, though equally real, are widely different and independent of their common theories.

A. G. Stapleton contributes to *Macmillan* some very interesting reminiscences of Canning and Frere, and some of the squibs jointly composed by them in 1825 for the amusement of their private circle. In prose the two friends thought in such harmony that each would finish the sentence the other had begun; two unpublished pieces of satirical verse are equally characteristic of the difference between their styles, the playful airiness of Frere being perhaps as much more poetical as it is less telling than Canning's concise ironical eloquence.

*Im Neuen Reich* (April 12, 19) contains an interesting study, by Gustav Freytag, on Nicolaus von der Flüe, a monk of Unterwalden, who was commonly reported, at the end of the fifteenth century, to have lived for twenty years without food, and who was ultimately canonised, although a vision seen by him had been interpreted of a coming Antichrist, whom Luther subsequently identified with the pope. Nicolaus was a layman, quite ignorant, and left a wife and ten children in the world when he settled in his hermitage; to the visitors who pressed him to say if it was true that he lived without food, his only answer was, "Gott weiss!" and his great natural shrewdness seems to have been, all things considered, very little tainted with charlatanism; in 1481 his representations were successful in restoring a good understanding between the towns and country districts of Switzerland. Several contemporaries described the impressions made on them by this saint, and it is curious that the passages of ancient journals, &c. modernised by Herr Freytag resemble nothing so much as—Walter Scott, whose pictures of society in the latter part of the middle ages are a good deal more faithful than it has been fashionable of late to admit.

In the *Revue des deux Mondes* (April 15) M. Renan completes his life of Nogaret; and M. Louis Etienne reviews *Le Théâtre* from 1869 to 1872. M. Sardou is accused of always sacrificing the moral unity of his situation to an ingenious and effective plot. M. Octave Feuillet is the only modern dramatist who succeeds in making passion supply the element of fatality indispensable to tragic effect. M. Augier's dialogue is admirable, but he is deficient in want of feeling. M. Dumas' latest works would be excusable mistakes if they had appeared without prefaces, but if the theatre is the confessional of society, M. Dumas treats his penitents too much like those casuists who suggest more sins than would naturally occur to lay minds. M. Pailleron has poetic merit enough to succeed in the higher comedy. M. Godinet's ingenuity is undeniable even when most perverse. M. Meilhac only wants measure and correctness to attain a legitimate success; moreover, the public is getting tired of the artifices which have amused it for twenty years; it still goes to the theatre from habit, but would welcome more ambitious poetry and sterner morality than is offered it at present.

H. Oesterley writes to the *Allgemeine Zeitung* to point out, what has not been noticed before, that the prose Latin versions of the old French poem *Dolopathos* are certainly derived from a metrical original, as was supposed, for that whole passages can be turned back into verse with very slight changes and transpositions. He is preparing a critical edition of the work.

M. Philippon, in *Im Neuen Reich* (April 26), writes on the "religious policy of Henry IV." to the effect that there was a great deal of policy and very little religion in his conduct, and that his tolerance was even more the result of scepticism than of calculation, but no fresh facts are adduced in support of this unfavourable view.

A collection of Danish tales of peasant life in Jütland has lately been published by "Thyregod" (a *nom de plume*) called *Blandt Bänder*. Some of them have literary merit of a very high order, and they are all thoroughly genuine and national in character.

Klaus Groth's lectures on "Lessing and his Time," which we before announced (*Academy*, vol. iii. p. 64), were delivered in German at the Taylorian Institution at Oxford on the 22nd, 23rd, and 25th of April, to a small though attentive audience. As is inevitable in the present phase of professorial sentiment in Germany, the political side of Lessing was brought into especial prominence. It was Lessing who emancipated German literature from French influence, and directed attention to England and especially to Shakespeare.

### Art and Archaeology.

**Fairy-Tales.** By Hans Christian Andersen. Illustrated by E. V. B. Sampson Low.

**Illustrations to Faust.** By Paul Konewka.

**Falstaff und seine Gesellen.** Von Paul Konewka. Strassburg.

THIS new book of E. V. B. displays the same faculty that charmed us in her *Story without an End* and *Dream Book*, yet for some reason or other it is not quite so satisfactory as either. The peculiar ability of the artist seems hardly sympathetic with Andersen's *naïveté* and northern homeliness. Something more quaint and simple, and above all more individual in style, than these elaborate designs would have been better suited to express the pathos of the "Ugly Duckling" or the "Little Mermaid." As it is, the massive background of cypress-trees and southern hills, the Florentine young men from Pinturricchio or Gozzoli, which illustrate the last scene of the "Wild Swans," or, again, the Albanesque water-babies in the "Little Mermaid," touch a wrong chord. The wicked princess in the "Fellow Travellers," arrayed in poisonous greens and yellows, with black hair and sallow beauty, is more akin to the spirit of Andersen; while the two pictures of the water and the air-carp and swallow life, studied each in its own element—which accompany the tale of Thumbkinetta, would, we feel sure, gratify the author's soul. Through all these pictures the special talent of E. V. B.—great delicacy of taste, sensibility to varied forms of beauty, sympathy with styles as remote and different as possible from one another—can be traced. Her instinct for what is graceful in decoration appears on the frontispiece in the wreath of swans' necks and heads, marvellously intertwined. Her power of expressing religious mysticism is seen in the "Angel of the Garden of Paradise;" the weirdness of her fancy, in the portrait of the Wicked Princess. These are all characteristics of the *Dream Book*; but we repeat that in that publication they both were more in place, and had a freer scope. A Book of Dreams may well contain many moods of shifting insight into the beauty and mystery of the world. The illustration of so peculiar an author as Andersen demands more unity of style in the artist. Another remark too may be made—that the minute and delicate workmanship of E. V. B. suffers grievously from the crude daubing of the colourist. This is most noticeable in the first illustration to the "Wild Swans" at p. 8. When we compare *this* with the fine touches reproduced by photography in the *Dream Book*, and far more with the delicate original from which the chromolithographs are copied, and which were lately on view

in the Dudley Gallery, we are justly indignant. The new translation of these eight stories of Andersen is excellent in freshness and simplicity.

Turning to the work of the late Mr. Konewka, we pass at once from the region of strong colours, carefully constructed pictures, and multifarious moods, to the eloquent monotony of shadow-land. This artist lived in a curious world—a world of *silhouettes*, black outlines moving on a white background, expressing nothing by the eye, depending on no accessories for effect, but owing their life and meaning to pure attitude and action, and the outline of features in profile. The necessities of Mr. Konewka's chosen style have forced him to study all the expressiveness of dumb-show; the result is that few artists better understand how to tell a story or to indicate a character by the raising of a hand, the curve of a back, the peculiarities of curls in hair, &c. As may be readily understood, this art of indirect indications lends itself better to slight or humorous subjects than to what is profound or tragic. On the whole, therefore, we prefer Mr. Konewka's children's books and *Falstaff* to his *Faust*. Yet it must be admitted that the mood of passionate despondency expressed by Faust's exclamation, "Entbehren sollst du, sollst entbehren," is adequately rendered by mere attitude in the *silhouette*, that the distinction between Margaret innocent and happy, and Margaret passionate or mad, is also made quite clear by little alterations in the tension of the limbs and the arrangement of the dress and hair. Perhaps the great value of these *silhouettes* is to bring home vividly to our minds the pregnancy of meaning which the slightest movement of the body can convey. A whole new science of physiognomy in attitude seems to be revealed. Mr. Konewka's children are particularly charming. His little boys have a quite peculiar grace. His pifferari dance and caper in the most attractive manner. But it is in *Falstaff* and the whole of his humorous circle, Poin, Pistol, Peto, Slender, Shallow, Bardolph, and the Merry Wives, that he has shown the greatest wealth of fancy. To some extent, both in *Faust* and in *Falstaff*, he has learned from Retzsch; but in his own province of expressive attitude and dumb show he stands unrivalled among artists.

J. A. SYMONDS.

### THE EXHIBITION OF THE ROYAL ACADEMY OF ARTS.

IT cannot but be acknowledged that portraits constitute as usual the principal feature, if not the principal interest, of this year's exhibition of the Royal Academy of Arts. Millais leads off with his splendid *tour de force*, "Hearts are Trumps; Portraits of Elizabeth, Diana, and Mary, daughters of Walter Armstrong, Esq." Then come his portraits of Sir James Paget, of the Marquis of Westminster, and of Master Liddell, son of Charles Liddell, Esq.—each in its way as good as can be. Never were the splendid physical endowments of this painter more manifest. As a painter of pure sense impressions he stands unrivalled. There can be nothing more startlingly real than the effect produced on the spectator who enters Gallery 3 by the figures of the girls playing cards, who regard him from the other end of the room. They are more real, more alive, than the living men and women who gaze on them. This powerful illusion is greatly enhanced by the scale of colour selected for rendering the subject. We find the keynote in the white azaleas of the upper left-hand corner, and, starting thence, the whole is set before us with complete unity of tone, in unmistakable, unmysterious daylight. Given the keynote, which is of course absolutely in the discretion of the artist, everything is right. As regards the apparently reckless handling, we must bear in mind that the science of representation is a science of symbols, and that each man has to adapt or invent symbols fitted to express the class of facts which he has intended to represent. In Mr. Millais' case the symbols which he employs are so admirably calculated to render the matter which he intends to render that we cannot

quarrel with them, though we may feel that they partake more of the nature of sleight of hand than of true workmanship. In his landscapes, as in his portraits of the surgeon, the marquis, and the boy, we may be sure that we have all that Mr. Millais saw of each scene, or of each creature, expressed in symbols fully adequate to the purpose. As a painter Mr. Whistler cannot compete with the splendid realism of Millais. But Mr. Whistler takes a foremost place in virtue of the intellectual power which he has shown in his forcible "Arrayment in Grey and Black; Portrait of the Painter's Mother." The treatment of the subject is stiff, and harsh even to painfulness. At first sight in its voluntary renunciation of any attempt to rouse pleasurable sensations by line, or form, or colour, it brings up a vision of the typical Huguenot interior—protestantism in a Catholic country. Then, the longer we dwell on it, the more cruelly vivid becomes the presentment to us of life with its sources of joy sealed or exhausted. Mr. Millais, as we have noticed above, starts directly from his sense impressions unmodified by any mental operation; Mr. Whistler starts from a precisely opposite point of view. The attitude of mind in his sitter being conceived, he has worked it out, selecting the key of colour and the lines of composition so as to enforce, as it were, rather the mental attitude than the material facts. In Mr. Watts we have an artist who is without the physical force of Millais, and (looking at Mr. Whistler's work of this year) without the intellectual vigour of Whistler. But Mr. Watts has a vein of poetic sensibility, and a refined taste, which make his work always interesting however unequal. His portraits of Mr. Calderon and Mr. Dunlop must rank amongst his best efforts. Both are fine in colour, and distinguished by the characteristic intention with which minor facts in each face are ignored or suppressed, the chief effort being concentrated in emphasizing the most essential lines only. By this method, when it reaches full success, we get, not so much the individual, but the type of which the individual is a variation; the root of the word; a simpler and at the same time a more condensed and intensified form of the man we know. Amongst the vigorous realistic painters of whom Mr. Millais must be reckoned the chief, Mr. Orchardson takes high rank with his unaffected and lifelike "Portrait of a Lady." It is a satisfactory piece of substantial work characterized by an air of healthy reality. The red gown has been successfully encountered, the figure stands well, and looks out of doors, which is saying a great deal. Gallait's "Mlle. A. B." is the work of a powerful and highly trained painter. The little child figure is alive with natural child piquancy.

When we leave the portraits, perhaps the marking picture of the exhibition is Mr. Walker's "Harbour of Refuge." It challenges attention even in the trying neighbourhood of Millais' dashing work. There may be in these galleries pictures more harmoniously complete in themselves as, for instance, Mr. Leighton's lovely poem, "Summer Moon," but there is no picture more considerable in real content. Mr. Walker gives us material enough to furnish out a lifetime of subjects to the average painter. Every figure in the group of old men is a separate study of character read with insight. The attitude of the careless servant who supports the old woman is admirably expressive, but her face—why has Mr. Walker suffered us to look straight into those eyeless sockets? The tone, too, is unsatisfactory, the atmosphere is oppressive, the air seems choked with brickdust. Yet, though there is something of relative failure, there is much of positive achievement, and we have cause to be grateful in the presence of so original an artist, who seizes out of the daily life of his people the elements of dignity and pathos. In Mr. W. Richmond we have not, indeed, an original artist, but an artist of considerable ability, and of natural good taste refined by constant study of the best models. His "Lament of Ariadne" is a striking performance. The individual study which has evidently gone to the rendering and the masterly treatment of the drapery go far to make us forget the first predominant impression, viz. that we hear "The Lament of Ariadne" by Mr. Richmond in the style of Mr. Leighton. Of Mr. Leighton's contributions we have before spoken (see *Academy*, No. 46, vol. iii. p. 148), and need only add that they fully preserve, in the disturbing glare and contrasts of a public exhibition, their own air of harmony and distinction. The "condottiere" is refined and spirited, and nothing mars our pleasure in "Summer Moon" but a faint sense of discontent that the painter has not felt and made us feel more clearly the

structure of the beautiful limbs before us. Mr. Poynter's "Andromeda" is disappointing. It is to be regretted that such an amazing quantity of good work would have been put into such a falling-to-pieces composition. It suggests a design originally intended to decorate some allotted architectural spaces. In the centre the monster, to right the clever-looking little Perseus, to left the chained woman whose lower proportions are of inordinate length, to right again, and again to left, two little pieces of landscape. The moment of action also is unluckily selected; we cannot stop with ease in the middle of the thrust which is to free Andromeda. But still there remains for us so great cause for satisfaction in the seriousness of intention, and in the amount of conscientious and artist-like work, as fairly vindicates the claim of "Andromeda" to be considered a painting of high importance. The grand processional air of Mr. Mason's band of harvesters has been a thing well found and finely felt. A great deal of the strange suggestiveness of this artist's works seems to arise from the very sense we have of their incompleteness. To the point desired, and sufficiently to place us in full relations with the motive, they are however finished, and that thoroughly; there the hand stops. Much may be slight, but nothing is sketchy. "Fair, Quiet, and Sweet Rest," by Mr. Fildes, hardly justifies the considerable eulogiums which have been passed upon it. It is undoubtedly a work of promise, but at the same time of inadequate performance. With brilliant qualities, it shows grave defects. From end to end there is not a passage exactly true in relation to any other. The vigorous Scotch-looking handling gives full effect to drawing which is not free from the reproach of slovenliness. But the fresh, bright spring of youth which seems to flow into the picture attracts and prevents us from being quite out of humour with the evident signs of want of scholarly training. Again a similar want will be felt in Mr. Boughton's work. The landscape of the "Flight of the Birds" is fine, but the figures are unreal and commonplace. The "Coming of Winter" must rank far higher than either of its companions. Here there is no obvious shortcoming, and it is distinguished by delicate sentiment and much grace of colour. If we turn from these works, charming as in some respects they are, and look at M. Tissot's "Les Adieux," we recognise at once the work of a well endowed and thoroughly accomplished artist. The work of a man who knows what he wants to do, and how to do it, "Les Adieux" is, both in conception and presentment, as polished and high-bred as a poem of the best society should be. There is not a touch, not a fallen leaf, which does not lead up to, or help in some imperceptible way, the main beauty of the picture, viz. the exquisitely subtle expression of the girl's face. "Lavinia" shows Mr. Leslie, always an attractive painter of daintily bred damsels, at his very best. His "Elopement" has been unfortunately hung. The virile force which Legros has put into his "Pelerinage" breaks down through the river and reeds below, and crushes them up and drives them out of sight utterly. Of Mr. Poole's "Remorse" it is equally difficult to speak, or to be silent. Can we leave it there with its strange imperative air unchallenged? Here is a man who has left us to our nineteenth-century realism, to our *vers de société*, and our verses of sentiment, and comes with a subject of which we know nothing set in a light which is a riddle to us, and embodied in shapes which are not human, and yet—here is some true artistic power.

In the Sculpture Galleries, "Maternal Love," by J. Dalou (terracotta, life-size), affords us a beautiful example of delicately just treatment of a modern subject. In statuary, as in painting, such subjects are for the most part invaded by dry dulness, or rush off into impertinent rococo. The mother and child are modelled with a simple directness of intention, guided by so fine a perception of beauty in life and delicate instinct for the just right mode of rendering it in art that they attain a quite classic charm. The same feeling may be observed in the little terracotta by the same statuary, "Le Jour des Rameaux," above which is Mr. Woolner's "In Memoriam," another example of good work and genuine artistic sentiment. And a very poetic conception will be found in Mr. Spencer-Stanhope's "Andromeda." The lower limbs are rather empty, but the torso, and indeed the whole upper portion of the figure displays modelling of a far higher order than one would expect from a mere acquaintance with Mr. Stanhope's work with the brush.

E. F. S. PATTISON.

## ART NOTES.

The death of Mr. Richard Westmacott, R.A., the well-known sculptor, occurred at Kensington on April 19th. Mr. Westmacott was born in London in 1799. Amongst his most esteemed works are reckoned "Venus and Ascanius," "The Player on the Cymbals," and a "Nymph and Faun." He was also the author of a history of sculpture, and of an essay on the colouring of statues.

The reorganization of the art institutions of Berlin continues to occupy much of public attention. No. 17 of *Im Neuen Reich* contains an article in which the brightening prospects of the museums are discussed. The writer points out that the increased funds at their disposal will enable them to undertake much which has hitherto been out of the question. He strongly urges the formation of a museum of casts from all the most distinguished works in foreign galleries, and invites the government to earn the thanks of the scientific world by employing the growing navy on voyages of archaeological investigation and discovery.

The April number of the *Preussische Jahrbücher* contains an article bearing Conze's signature which carefully estimates the relative merits as catalogues of the late Dr. Carl Friederichs' *Berlins antike Bildwerke* and Bötticher's *Königliche Museen*. The writer considers that Friederichs' book, although defaced by certain much to be regretted blemishes, is a model of genuine popular treatment, and offers as much of interest to the laity as to the learned. Bötticher's catalogue, on the one hand, wants in comprehensiveness, and, in spite of the dragging in of all possible *minutiae*, is not sufficiently worked out to be of service to the learned, and, on the other hand, takes in too much for the simple public, and is often so abstruse as to be incomprehensible.

M. Léon Heuzey, professor of archaeology at the École des Beaux-Arts, has just brought his course of lectures to a close by two experimental lessons on Greek costume, to which he invited members of the Academy of Fine Arts, art students, and critics. A patient study of the works of Greek antiquity has convinced M. Léon Heuzey that the costume of the men and women of ancient Greece was composed simply of squares of stuffs varying in dimension. With squares of various stuffs M. Heuzey reproduced on the living model all the diverse and often complicated arrangements of drapery which are to be found on the statues, bas-reliefs, and vase paintings of ancient Greece. Last year the professor terminated his course by similar experiments illustrating Assyrian and Egyptian costume. Next year he intends to take as his subject Roman archaeology and the more complicated costume of the Roman people.

M. Jules Canonge bequeathed to the Louvre in 1870 two valuable drawings in red chalk by Raphael, representing one Psyche, the other Jupiter giving a kiss to Love. These two drawings are now publicly exhibited in the Salle Louis XIV of the Musée des Dessins. All the sculptures, vases, and bronzes from the châteaux of the Tuileries, Meudon, and St.-Cloud, are at present brought together in the gallery of the Daru Pavilion.

MM. Édouard Dubufe and Mazerolles are about to open in Paris a studio for pupils.

The April number of the *Zeitschrift für bildende Kunst* contains a very excellent etching, by W. Unger, of "Die Lautenspielerin," after Terborch. The original is one of the "Meisterwerke der Kasseler Gallerie."—Wilhelm Schmidt, of Munich, contributes some original researches on Jean Baptist van der Meiren, commonly known as van der Meer.—B. Stark draws the attention of the German public to the importance of the recent excavations on the site of the temple of Diana at Ephesus, in a valuable letter addressed to the editor, v. Lützw, and accompanied by a plan of the situation.

The Oesterreichische Museum in Vienna is making preparations for a permanent exhibition of the various modes of reproducing works of art. The special committee of organization

consists of Artaria, v. Eitelberger, v. Hauslab, Schestag, and Moritz Thausing. The scheme for the first exhibition includes five groups: (1) Engraving in wood and metal; (2) Etching; (3) Lithography; (4) Galvanoplastic impressions; (5) Daguerreotype, photography, photolithography, heliography, albertotype, and nature-printing.

The art-union of Basle is engaged in forming an exhibition in honour of the opening of the newly erected Hall of Art. The exhibition is to include the paintings both of modern and ancient masters, and will commence on May 26. It is said that the schools of Munich and Düsseldorf will be in great force, although Swiss artists will of course occupy the first rank. The Netherlands are to furnish the chief contingent of the works of old masters, but both the Italian and French schools will be well represented.

The sale of the works of art belonging to M. Henri Rochefort took place on April 17. With the exception of a Meyer, "Plage de Scheveningen," which was sold for the rather high price of 1550 frs., and a van Goyen, which went for 780 frs., all the paintings were of a very middling order.—A large and valuable collection of Limoges enamels was disposed of by M. Pillet on April 12; the most remarkable were—Penicault (le vieux): a fine triptych, the centre compartment representing Christ on the Cross; the left wing, Christ bearing the Cross; the right wing, the Descent from the Cross; each plaque 26 c. in height, the centre 24 c. in width, and the two sides 10 c.; 3500 fr. Pape (N.): a very fine plaque, which had formed a portion of a triptych representing figures in a landscape looking towards the left, and appearing to listen to some one preaching; 32 c. high, 17½ c. wide; 2500 fr.—The paintings left by M. Zamacois came to the hammer on April 15. "L'Heure du Rendez-vous" went for 6000 fr.; "Un Confessional," 6100 fr. These were the highest prices reached by the works of the artist himself. His collection, which was sold at the same time, contained a fine painting by Madrazo, "Jeune Femme jouant avec un Singe," and several examples of Fortuny—a painter whose works are rarely seen in auction rooms.—On the same day took place the sale of the collection of M. L. M., the principal event of which was the active competition for a picture by Brascassat, "Taureau attaqué par un Chien," which was knocked down for 10,550 fr.—We find that the Berlin Museum is not the lucky purchaser of the du Cerceau work which came to the hammer at the sale of M. Vaudoyer's effects. The *Chronique des Arts* for April 24 corrects this statement, which we copied from a previous number. The work of du Cerceau was acquired by M. Edmond de Rothschild.—The last days of the sale of the Gillott collection, the 4th and 5th May, fully equalled in excitement and interest those which preceded them. Several fine examples of Turner went for very high prices; the "Ehrenbreitstein" for 2650 guineas, "Bamborough Castle" for 3150 guineas. Drawings by Hunt brought prices varying from 200 to 500 guineas. The large Rubens fetched only 1200 guineas.

## Theology.

## TO THE EDITOR OF THE ACADEMY.

SIR,—It is always dangerous to publish opinions upon part of a great question without also laying down, explicitly as well as implicitly, the wider principles which should cover the question as a whole; and I see by your note in the current number of the *Academy* that I have not escaped this danger.

I have promised, if possible, to carry on my enquiry as to the Fourth Gospel also to the Synoptics; and, till this is done, I must venture to think that some of your objections to my argument are a little premature. I am quite ready to admit the "antecedent probability" of a legendary element finding its way into the Evangelical history. But "antecedent probability" will not carry us far. We ask to *what extent* legendary matter has thus entered in. And the only way in which the answer can be given is by determining the relation in which the writers stand to their history. This, I think, can be decided in the case of the Fourth Gospel by independent considerations; and if such considerations point to the Apostle St. John as the author of the Gospel, it appeared to me rather superfluous to argue the question of legend in connection with it further. The same conditions do not apply to the Synoptic Gospels; and it slightly misrepresents me to say that I deny the existence of legendary matter in these. On the contrary, I have rather asserted it (pp. 258, 267, 268). But I think there is strong evidence to show that such legendary accretion as seems to be there is still very near to the original facts. When I come to the Synoptic Gospels, I will state my reasons for this opinion more fully, but in the meantime I can hardly admit that the objection is relevant to my present argument.

Again, I think you push into a little too much prominence the particular argument from the "circumstantial precision" of the Gospel. I have only made use of this along with others, and it loses a great part of its force when separated from its context. The point of the sentence quoted lies in the conditional clause. I say that the relations of Judaism to nascent Christianity are depicted in a way in which they could not have been, had the author been born after the taking of Jerusalem—and I am not aware that this argument has ever been fairly met. Besides I maintain, and have endeavoured to establish step by step, that the circle of ideas within which the Gospel moves is entirely the Evangelical and Apostolic circle, not the Gnostic or any other.

I did not fancy that I had given any great prominence to Sir R. Hanson: at least as much, I should have thought, is given to Dr. Scholten and M. Renan, not to speak of authors like Meyer and Weizsäcker, with whom I more nearly agree. My reason for choosing Dr. Keim was simply because he seemed to hold the anti-Johannean hypothesis in its most tenable form and with its least substantial element sifted out of it. If any better representatives of this theory exist, I should be glad to know of them. The hypothesis of "mediate authorship" (pp. 301-4) may perhaps need more discussion, but I am convinced myself that it will not hold, and that the arguments are all there, and only need to be arrayed.

If it is true that "many of my arguments have too strong a likeness to the (present?) century," by all means let them be dismissed. I had made it my endeavour to exclude all that was not based on permanent conditions of human nature; and wherever I have failed to do this, I have missed my object. But care should be taken lest, in flying from one form of modernism, we fall into another. I am convinced that a good deal of German criticism (admirable, magnificent as that criticism is) is yet essentially modern, and not only modern, but German in the restricted sense. That is why I do not adopt quite so fully as you would wish me the method of "liberal"—i.e. practically of "liberal German"—criticism. I am prepared to defend my procedure in this respect, and I hope I shall be able to make it appear in time that the principles upon which I have worked are not taken up at hap-hazard, but hang systematically together.

W. SANDAY.

Great Waltham, Chelmsford, May 3.

[So far as our note is liable to misconception, we are most happy to modify it in the sense of the above explanation. To take the points in order. First, German criticism has passed through several phases, and we questioned whether an English critic was justified in taking up the subject at such an advanced point. This doubt, however, was only thrown out incidentally. As for Sir R. Hanson, it is true that he is referred to, as far as we can remember, only twice by Mr. Sanday, but on both occasions in a pointed manner, and apparently as the most

noteworthy English writer. Secondly, we are quite aware that Mr. Sanday's argument from circumstantial precision hangs together with that from the doctrinal characteristics of the Gospel, but we thought, perhaps erroneously, that this was patent to the reader by one express mention of the complete analysis of the book. The quotation about Shakespeare tempted us by its incisiveness. Our third remark was to the effect that the admission of the historical character of the Fourth Gospel involved a similar admission with regard to the other Gospels. This was no doubt liable to misconception: we should have said, "with regard to great part of the other Gospels." The relevance of the argument is an open question; we only asserted that it might be urged by an objector. Fourthly, Mr. Sanday is mistaken in supposing that "liberal" criticism is identical to us with German. Not so; criticism is essentially neither German nor English, but should seek to transcend mere local or temporary peculiarities. And we fear that Mr. Sanday's psychological point of view has not escaped the danger of oneness.]

## Contents of the Journals.

*Journal Asiatique*, Jan.—Rapport sur une mission archéologique dans le Yémen; par M. J. Halévy.—Nouvelles et mélanges: *Phœnic Values*, and *History of Assurbanipal*, by G. Smith; par M. J. Oppert. [We regret the bitter tone of M. Oppert's criticisms, which points to some personal misunderstanding between himself and Mr. Smith. It would be absurd to ignore the eminent services of M. Oppert. We question however whether he himself always observes the rule of acknowledging the labours of his predecessors. Two or three of his facts are questionable. *Mat Mas* is not *madbar(u)*, "desert," but "the land of Mash" (Gen. x. 23). The *Iphtatael yuctatalsir* is paralleled by the *Istataphal yustetesir*; and the value *nas* assigned to the character *ta* is imaginary.]—Yarkand (Mr. Forsyth's mission); par J. M.—Lettre à M. Jules Mohl.

Götting. gel. Anzeigen, March 27.—Kohut on the Persian translation of the Pentateuch by Taus; rev. by H. E., who finds much to censure in the execution of the work, and questions the authorship of Taus (Taus, *raas*).—April 24. Works on Libyan inscriptions by MM. Reboud, Faidherbe, and Judas; rev. by H. E., who expresses a hearty recognition of the services to linguistic science rendered by the French in Algeria; he adds a few words on Count Sierakowski's work on the Berber languages and tribes, which includes a grammar of the Schaûi by M. Torchon.

REUSS, E. Bibliotheca Novi Testamenti Graeci. Strassburg.

## Philosophy and Science.

Auerbach's Edition of Spinoza. [*B. de Spinoza's Sämmtliche Werke*. Translated from the Latin, with a Life of Spinoza, by Berthold Auerbach. 2 vols. Cotta.

SINCE the first edition of this work was published thirty years ago, 3000 copies have been sold—a fact on which the translator is not unreasonably disposed to congratulate his countrymen, as the number must have been made up outside the learned classes to whom the Latin text is accessible. The present edition is "corrected and enlarged;" the new matter in the life is chiefly derived from van Vloten, whose discovery of unpublished letters to and from Spinoza led to the identification of two anonymous correspondents with Dr. Schaller and a young Saxon noble von Tschirnhaus. These letters were translated in 1870 by Dr. Willis, *B. de Spinoza, Life, Correspondence, and Ethics*; and to English readers by far the most valuable part of the present work is that supplied by Professor Schaarschmidt, who translates the early work of Spinoza which he had edited in the original Dutch in 1869, and which was only otherwise accessible in an uncritical Latin translation by van Vloten, its discoverer. This *Korte Verhandeling van God, de Mensch en deszelfs Welstand* ("Short Treatise on God, Man, and Human Happiness") covers nearly exactly the same ground as the *Ethics*, and contains by implication all Spinoza's characteristic doctrines; but it is of peculiar interest to the student of his system as

showing which parts of this Spinoza accepted for their own sake, and which as necessary logical inferences from previous assumptions, for it is certainly one of the disadvantages of the mathematical mode of demonstration that a conscientious thinker is led by it to say sometimes more and sometimes less than he presumably thinks. The two points on which Spinoza's views seem to have undergone modification as well as development are the will, of which he is more anxious to deny the existence than the freedom, though this is perhaps rather a difference of language and arrangement than opinion (cf. *Eth.* ii. 49, cor.); and the natural world, which in chap. iv. he seems half inclined to speak of as "der Gottheit lebendiges Kleid," instead of, as in the *Ethics*, strictly identifying God and the whole sum of natural existences.

In his translation Auerbach has aimed, he tells us, at faithfulness and accuracy, and "dabei möglichst deutsch zu schreiben;" in the latter respect he may have been more successful than in the former, though we cannot think that his style would have lost by following the pointed terseness of the original more closely. He seems as a rule to give the general sense, which it is scarcely possible to mistake, with sufficient accuracy; but he does not aim at reproducing the exact value of each word in the text, and, what is worse, he allows himself to use different equivalents for the same word, and the same equivalent for different words. Thus *idea* is generally *Vorstellung*, but sometimes *Idee*; *imaginatio* is sometimes *Einbildungskraft*, sometimes *Phantasie*, and *imaginari* sometimes *sich in der Phantasie vorstellen*, sometimes *sich einbilden*, sometimes *darüber phantasieren*. It is thus left to the translator's discretion what precise shade of meaning a particular passage shall receive. *Vorstellung* and *Einbildungskraft* are German for idea and imagination, and it was for Herr Auerbach to explain, if necessary, how much of the ordinary literary connotation of the words his readers must dismiss from their minds in order to follow Spinoza's use of them. We had marked a few passages taken at hazard, in which we had to turn to the original for explanation of the translation: vol. i. p. 529, we find the precept, "Vergnügen nur so weit zu genießen, als es zur Erhaltung der Gesundheit genügt." Spinoza could not have written this, and did write *Delictis in tantum frui*, &c.; the *nur* is redundant, and almost reverses the meaning. Vol. ii. p. 430, is an instance of the same word set to do double duty; Herr Auerbach has, "so weiss ich nicht, wer ihm gesagt hat, dass wir . . . nur durch freien Beschluss des Geistes festen und beständigen Geistes sein können;" Spinoza, of course, "ex libero mentis decreto fieri ut firmato et constanti simus animo;" and in the same letter the phrase, "qua in re satis, ne dicam, nimis confidenter perstat," might surely be better translated in a rich and flexible language than as we find it, "und hierbei bleibt er ziemlich, um nicht zu sagen, allzu vertrauensvoll stehen." Small blemishes and inaccuracies (*Machtvollkommenheit* for *sufficientia*, *das Verständniss* for *res intelligere*, &c.) are rather numerous, and though it may be said that these are trifles, still it is scarcely worth while to translate an author like Spinoza unless he is to be naturalised amongst the classics of a language; and a good deal will have to be done to the work before us before it will dispense any serious amateur of Spinozism from the necessity of learning Latin. There is a real difficulty in vol. ii. p. 325; Spinoza is answering Blyenbergh's enquiry whether God was the cause of Adam's disobedience, and the obscure passage runs "non vero quatenus malum erat; nam malum, quod in eo erat, non erat aliud quam privationis status, quem propter illud opus Adamus amittere debebat." Willis translates quite at random, "not however, as it was evil, for the evil that was in it was nothing other than a state of privation into

which Adam must fall by reason of the act;" Auerbach not much better, "denn das Böse, das darin war, war nichts Anderes, als der Zustand der Beraubung, welchen Adam wegen jener That annehmen müsste." This is one of the letters which was not written in Latin, and perhaps Professor Schaarschmidt will be able to correct the common text by the original Dutch version; but meanwhile we had certainly better construe, "For the evil which was in it was nothing else than (the evil) of privation of the state which (state) on account of that deed Adam was to lose."

H. LAWRENNY.

**The Morphology and Physiology of Plants.** [*Botanische Abhandlungen aus dem Gebiet der Morphologie und Physiologie.* Herausgegeben von Dr. Johannes Hanstein, Prof. der Botanik an der Universität Bonn.] 1870-1871.

FOUR numbers of this important publication are now before us; each number, whether of smaller or larger dimensions, being devoted to a single subject with a separate title-page, so as to be complete in itself. The subjects already published are as follows:—1. The Development of the Embryo in Monocotyledons and Dicotyledons. 2. On the Structure and Development of Bacillariae (Diatomaceae). 3. On the History of the Growth and Morphology of the Roots of Phaenogams. 4. On the Development of the Embryo in the Genus Selaginella. It will at once be observed that the subjects are not such as promise much novelty, but it is of great importance that, after the various theories which have appeared from time to time, we should at last have some point on which we can firmly place the sole of our foot. It is much to be wished that botanical instructors, or the handbooks which are submitted to students, should not bewilder them with a multitude of theories, good sense in most cases being sufficient to indicate what is really the true one. It is proposed at present to confine our remarks to the two latter subjects with the intention at some future time of adverting to the two earlier numbers.

The paper on the development and morphology of roots is due to J. Reinke, but the observations were conducted under the guidance of the editor. The consideration of the root of Gymnogens did not come within the views of the author. The subject is of some importance as regards the prevalent notions of the functions of the spongelets or hood (Haube), as it is called in the memoir, the truth in all probability lying between extreme views on either side. That it is active at the first moment of development can scarcely be doubted, though the outer cells soon become effete and inactive. The young root is by the author divided into five parts: the pleroma, which, as the name implies, fills up the centre of the rootlet, and is homologous with pith; a layer of cells called pericambium, which lies between the pleroma and another set of cells, to which he gives the name of periblema, which may be regarded as the rudiments of bark; another layer of cells beyond this called the dermatogen, which generates the cuticle above and the spongelet below. The process is just the same in adventitious roots, which appear almost always to be developed in the neighbourhood of a spiral vessel. Slight modifications occur now and then, but the general structure is just what is described in the case of the primary and adventitious rootlets of the common sunflower. It is to be regretted that the anomalous primary rootlet of Tropaeolum did not come under notice, and it would have been very interesting to know precisely the relations of the coleorrhize, which is quite distinct from the false coleorrhize arising from the prolongation of the base of the cotyledons, to the included rootlet. The production of the four adventitious rootlets in Impatiens almost contemporaneous with the development of the primary rootlet is

very curious. The term endorhizal ought to be expunged as characteristic of Monocotyledons, as in the greater portion of the class the first root is as truly exorhizal as in any Dicotyledon.

The other memoir to which we advert at present is that on the development of the embryo in the genus *Selaginella*. It is not, however, confined merely to a portion of what had previously been so well done by Hofmeister, and it would perhaps be difficult to point out any important additional information which it affords; though some points, as the development and form of the spermatozoids and of the rootlets, are treated at greater length than could be expected in a mere general investigation like that of Hofmeister. The several stages, moreover, of the formation of the suspensor and embryo are carried out more continuously, and we have the fact put forward more prominently that the plumule and primary rootlet are horizontal, and not vertical, as in ferns. The occasional transformation of the aerial roots into leafy shoots is curious. As regards the development of the roots themselves there is merely a resemblance with that of *Phaeogams* in the earliest stage, and that only in certain plants. In *Phaeogams* the several parts enumerated above, pleroma, &c., are from the first distinctly separated, whereas in the vascular Cryptogams they are merely differentiated as well in the embryo as in the growing stem by corresponding divisions in the segments.

The lettering unfortunately in the former memoir is not always very clear, which makes it difficult to understand the figures, which is the more necessary as the terms used are not familiar.

M. J. BERKELEY.

### Notes of Discoveries and Scientific Work.

#### Geography.

**Central Asia.**—The narrative of a most important journey in Central Asia, made in the summer of last year by A. P. Fedchenko, is given in *Petermann's Mittheilungen*, having been prepared from a collection of the traveller's letters published at Tashkend. Central Asia, especially the region surrounding the high valley of Eastern Turkestan, has long rivalled the North Polar area and the Nile basin of Africa as a centre of attraction for geographical explorations. The present journey forms the chief step in the steady advance which has been made from the Russian side. Fedchenko entered the diminished Khanate of Kokand from Kojend, in the Russian province of Turkestan, and at an audience granted by the Khan at the capital city he obtained a written permission to travel in the Khanate. From the city of Kokand the traveller first went southward by Ispara, on the way which leads through the mountains to the principality of Karategin; but the passes in this direction were closed to the Kokandians through a rebellion of the Kirghiz. Fedchenko describes the head of the Ispara valley as an extensive circus, on the southern side of which eight peaks rise to a height of from 18,000 to 19,000 feet; between each of these a great glacier with side moraines sinks into the valley, descending to a level of about 10,000 feet above the sea. The pass to Karategin is over one of these glaciers. From this the route lay across the high spurs of the mountains which bound the Khanate, south-eastward to where a side valley of the Syr Daria, that of the Kurshab, a small tributary, leads up to the most important pass of the whole region, the Terek-Dawan, on the highway to Kashgar and Eastern Turkestan. The Terek pass is scattered over with great stones to such an extent that it can only be used for traffic in winter, when the snow has filled up the spaces between these. In summer the caravans take a more circuitous route by a side pass. The summit of the Terek, looking down towards Kashgar, appears to have been the extreme limit of the journey.

**Southern Arabia.**—The results of elaborate investigations of the geography of Southern Arabia, made during a long residence in the neighbourhood of Aden, by Freiherr von Maltzan, are published in the same journal. Von Maltzan obtained his knowledge for the most part by a regular system of examination of every traveller arriving by any of the routes which centre in Aden; and by comparing the accounts thus received with the descriptions given in the manuscript work of the Arabian geographer "El Hamdani," a copy of which he was fortunate enough to find in Aden. In this way he has been able to map out a region of the country stretching north- and eastward almost equal in extent to Bavaria. When studied along with the journeys of von

Wrede, Munzinger, and Miles, the map forms a most valuable addition to geography, by filling up a space which was hitherto a perfect blank.

**The Yellowstone National Park.**—This remarkable tract of country, to which attention was directed in the *Academy*, No. 46 (vol. iii. p. 151), has been described in considerable detail by Dr. F. V. Hayden in the parts of the *American Journal of Science* for the present year. The April number contains a map of the park and its surroundings, and the Report of the Committee on Public Lands, which serves to explain its many interesting features.

**Ameland.**—A company has been founded, and operations already commenced, for the purpose of throwing a double dam across the Wadden, which flows between Ameland and the mainland, and uniting this island with Friesland. The soil of Ameland, which affords very rich pasturage, is fast being worn away by the sea. An interesting description of the island, and the great engineering undertaking that is to save it from destruction, is given in *Das Ausland*, 1872, No. 11.

*Die Zeitschrift der Gesellschaft für Erdkunde zu Berlin*, No. 36, contains a description, by Dr. Nachtigal, of Wara, the chief town of Wadaï, with a population of about 10,000. The paper contains a detailed account of the palace of the Sultan and the chief buildings, and is provided with a plan of the town.

The correspondent of the *Times* in Rome, in a letter of the 8th inst., states that reports had reached Naples of an extraordinary ebullition of the sea near Stromboli.

#### Zoology.

**On the Early Stages of an Ascidian.**—In the year 1866, Kowalevsky published a remarkable series of observations on the embryology and early stages of several Ascidians, in which a structure similar to, if not identical with, the type-characters of the Vertebrata was demonstrated. These observations were confirmed by Kupffer, who showed, in addition, that the nerve-mass actually penetrates the tail of the embryo to a considerable distance; but met with opposition from Dönitz, in a paper which has hitherto been almost entirely ignored. Kowalevsky, while continuing this line of research in tracing the embryology of *Amphioxus*, believed he saw a very close resemblance between this lowest form of the class of Fishes and similar stages of the Ascidian; and other zoologists arrived at the conclusion that the connecting link between Vertebrates and Invertebrates had been discovered. In support of this view, additional and not unimportant evidence is furnished by Dr. E. S. Morse, in a paper "On the Early Stages of an Ascidian (*Cynthia pyriformis*)" (*Proc. Boston Soc. Nat. Hist.* xiv.). In larvae just freed from the egg, he observed so distinct a segmentation of the axial chord that he was enabled to count the segments, forty in number, four of which extended into the body proper. The tail was surrounded by a fin, in which could be clearly distinguished numerous fine diverging rays, as in an embryo fish. The axial segments were nucleated, and enclosed in a continuous investing sheath, which disappeared at the caudal tip. The paper by Dönitz alluded to above is entitled "On the so-called Chorda of Ascidian Larvae, and the Supposed Relationship of Invertebrate and Vertebrate Animals," and is published in the *Sitzungsberichte der naturforschenden Freunde zu Berlin*, 1870-71, as well as in the *Archiv für Anatomie und Physiologie* (pp. 761-764). Dr. Dönitz, who made his observations on *Clavellina lepadiformis* at Naples, states that the central nervous mass, as described by Kowalevsky, is not found in the larval *Clavellinae*; that the string of cells, intermixed with vacuoles, in the axis of their tail, is only apparently similar to the vertebrate chorda, being, in fact, quite different from it; and that these cells are arranged concentrically, and not in bilateral order, nothing like a vertebra being formed. He thinks it even very doubtful if the adjoining cells can be regarded as muscle-cells.

**Fossil Phascalomys.**—Professor Owen has read before the Royal Society (*Proc. Royal Soc.* 1872, 131) another chapter of his *Fossil Mammals of Australia*, treating of the remains of species of Wombat similar in size to the known existing kinds. These researches are made on specimens obtained from the bone-caves of Wellington Valley, and the freshwater deposits of Queensland. Modifications of the lacrymal, maxillary, and palatal bones in the existing species of wombat were applied to the determination of the fossils, and the author was thereby enabled to distinguish, in addition to the *Phascalomys Mitchelli*, known since the year 1835, a second species, which he has named *Ph. Kreffti*, after its discoverer. Having likewise met with valuable distinctive characters in the mandible, he shows that *Ph. latifrons* is represented among the fossils from the Wellington Valley caves. Three other new species, *Ph. Thomsoni*, *Ph. platyrhinus*, and *Ph. parvus*, are also founded on mandibular remains from Queensland, the last species being markedly inferior in size to any of the known living wombats. Prof. Owen promises, in a continuation of this memoir, an account of the extinct species which exceeded in size the existing wombats.

Although several more or less complete treatises on and lists of the Birds of New Zealand have been published, they were rather of a

tentative and preliminary character; and the work before us (*A History of the Birds of New Zealand*, by W. L. Buller; London and New Zealand) is the first which gives a full account of this ornithic fauna, which, in zoological interest, is not excelled by any other country. The work comprises an introductory treatise on the ornithology of New Zealand; a diagnosis of each species, male, female, and young, with the synonymy and references to the more important part of the literature, followed by a detailed description, to which is added a full account of the life-history and habits of the bird. About one-half of the species, which amount to some 150, will be represented by coloured illustrations. The work will be issued in five parts, each containing not less than seven plates, and we understand that the author contemplates to conclude it with an account of the osteology of the more remarkable forms. There can be no doubt that Dr. Buller, well known in Europe by his preliminary ornithological publications, is eminently qualified to fulfil this task. His long residence in the colony and his official position have given him rare opportunities of making observations and collecting materials; and by a lengthened visit to England he derived the great advantages of studying typical examples, and of availing himself of that typographic and artistic skill in which this country excels. To judge by the first part just issued, Dr. Buller has succeeded in producing a work of real excellence. The text is clear, instructive, and not overloaded with unnecessary detail; while the illustrations are beautiful and life-like. The remaining parts are to be issued at very short intervals.

The sixteenth volume of the *Bulletin de l'Académie impériale des Sciences de St.-Petersbourg*, 1871, contains some highly interesting papers:—1. L. von Schrenck, Report on Several Individuals of Mammoth said to have been recently found in Northern Siberia, from letters received from M. Gerh. von Maydell, with remarks on the way in which these bodies may have been preserved, their scarcity, &c. (pp. 147-173).—2. Alex. Brandt, Supplementary Remarks on Fossil Medusae (pp. 413-422).—3. J. F. Brandt, Report on the Progress of his Researches on Cetaceans inhabiting seas which covered Central Europe and Asia during the Tertiary epoch (pp. 563-566).

*Berichte des naturwissenschaftlich-medizinischen Vereines in Innsbruck*, i. 1871, contain only one zoological paper, which may be easily overlooked, as this journal is almost unknown in this country. It is a memoir by C. Heller, "Untersuchungen über die Crustaceen Tirols," No. 1 (pp. 67-96, with 2 plates). Of the descriptions of the various species, we notice particularly those of two new *Cyclops* and one new *Candona*.

The Linnean Society has issued the fourth and concluding part of the twenty-seventh volume of its *Transactions*. The following zoological papers are contained in this volume:—1. H. B. Brady, W. K. Parker, and T. R. Jones, A Monograph of the Genus *Polymorphina* (pp. 197-254, pls. 39-42).—2. A. Ratray, On the Anatomy, Physiology, and Distribution of the *Firolidae* (pp. 255-276, pls. 43 and 44).—3. Sir J. Lubbock, Notes on the *Thysanura* (pp. 277-298, pls. 45 and 46).—4. E. L. Moss, On the Anatomy of the Genus *Appendicularia*, with the description of a new form (pp. 299-304, pl. 47).—5. St. G. Mivart, On the Vertebrate Skeleton (pp. 369-392, pl. 53).—6. O. P. Cambridge, Descriptions of some British Spiders new to Science; with a notice of others, of which some are now for the first time recorded as British species (pp. 393-464, pls. 54-57).—7. R. O. Cunningham, Notes on the Reptiles, Amphibia, Fishes, Mollusca, and Crustacea obtained during the voyage of H.M.S. *Nassau*, in the years 1866-69 (pp. 465-502, pls. 58 and 59).

The *Forhandlinger i Videnskabs-Selskabet i Christiania*, 1871, contain, besides several smaller notices of local interest, a long paper by Axel Boeck, "Crustacea amphipoda borealia et arctica," pp. 83-281, preliminary to a larger work which will be shortly published, illustrated by 32 plates.—Professor Esmark contributes diagnoses of two new fishes, *Mauroliscus* and *Argyropelecus*, p. 489.

It is with very great regret that we have to record the death of Mr. GEORGE ROBERT GRAY, which took place on the 6th instant, after a short illness. He was born in the year 1808 at Little Chelsea, and was appointed an Assistant in the Zoological Department of the British Museum in 1831. At the time of his death, he occupied the post of Assistant Keeper of that department. He established his reputation as an ornithologist by his *Genera of Birds*, a great work, in the production of which he was engaged for twelve years, from 1837 to 1849. From that time he was *facile princeps* in this branch of science, to which he devoted himself almost exclusively. Only a short time before his death he completed his invaluable *Handlist of Birds*, published in three volumes by the Trustees of the British Museum.

#### Botany.

**Experiments on Hybridization.**—Mr. J. Anderson-Henry, one of our most skilful horticulturists, is contributing to *The Garden* the details of some important experiments on pure hybridization, or crossing distinct species of plants. He finds that in those plants which possess two series of stamens, one long and one short, the results vary essentially

according as the pollen is used from one or the other series to effect the fertilisation. He uses the short stamens only in all cases where he wishes to cross a large on a small species, and with the most successful results. The converse also he finds to hold good, remarkable hybrids being produced by using the long stamens where he wished to cross a small on a large species. The reason of this he considers to be that the shorter stamens contain pollen of smaller grains, and therefore better fitted to emit its tubes through the style to fertilise the ovules of the smaller species, and *vice versa*. The plants chiefly operated upon by Mr. Anderson-Henry are various species of *Geranium*, *Rhododendron*, and *Azalea*.

**The Formation of Ozone by Flowers.**—It has been found by Mantegazza (*Rendiconti del Reale Istituto Lombardo*, vol. iii. fasc. vi., abstracted in *Der Naturforscher*, 27th April) that many essential oils, like that of peppermint, turpentine, oil of cloves, lavender, bergamot, aniseed, nutmeg, thyme, and others, when in contact with the oxygen of the atmosphere in presence of sunlight, develop very large quantities of ozone. The oxidation of these oils is, in fact, a very convenient source of ozone, as they, even in small quantities, ozonize much oxygen. The action is strongest in direct sunlight, far less so in suffused daylight, and very weak or at an end in the dark. The development of ozone which has been begun in the light continues for a long time in darkness. In the same manner act eau-de-cologne, hydromel, and other aromatic tinctures on exposure to the solar rays. Experiments which Mantegazza has made on flowers with powerful perfume, such as the narcissus, hyacinth, heliotrope, mignonette, and others, in closed vessels proved that they also form ozone. Those with fainter perfume produced less ozone, those without scent none at all. Mantegazza believes that this important source of ozone is of hygienic value for the purification of the air of marshy districts.

#### History.

**Droysen's History of Prussian Policy.** [*Geschichte der Preussischen Politik*. 4. Theil, 2. Abtheilung: Friedrich Wilhelm I., König von Preussen.] 3 volumes. Berlin: Veit and Co., 1869-70.

OF Professor Droysen's comprehensive work on Prussian Policy, four parts have now appeared, in ten volumes. The first part, reaching to 1440, describes the origin of the power of the Hohenzollern in Brandenburg, after the Emperor Sigismund, in 1415, gave that electorate (its Ascanian dynasty having died out) to Friedrich of Hohenzollern, the Burggraf of Nuremberg. The second part carries on the his-

tory of the electors to the Thirty Years' War; the third describes to us the Great Elector Friedrich Wilhelm, 1640-88; the fourth contains a history of the first King Friedrich I., 1688-1712, and his successor Friedrich Wilhelm I., 1712-40; while a supplementary volume describes the original authorities and discusses critical difficulties. We shall here notice the account of Friedrich Wilhelm I.

Historical events often have not only a preparatory but also a retrospective influence, since they give a meaning and importance to occurrences which the latter would not seem to possess if considered by themselves. The recent growth of Prussian power sets before us the aim as it were of all those events which Droysen describes; in the beginning we seem to see the end. This is especially the case with our author's later volumes; in the earlier parts he is not always successful in making it visible to us, but in Friedrich Wilhelm I.'s time it is clear enough. This prince has been often unfavourably judged. The Memoirs of his daughter, the Margravine Wilhelmine of Baireuth, the narratives of Pöllnitz and Seckendorf, &c., represent him as half perverse and half foolish, and this is perhaps still the erroneous view among those readers abroad who recollect Macaulay's essay on Frederick the Great. A more favourable view, however, soon was formed in Germany, where men perceived that wonderful energy and an earnest and honest will and sense of duty lay hid under the rough outside of that arbitrary character. His son and successor already recognised this, though he had himself been not among the least sufferers from the harshness of his father's character. The judgments passed on the king by J. von Müller, Förster, and Preuss, by Ranke and in England by Carlyle, agree in the main with Droysen's view. Droysen too does not go much into the personal character of Friedrich Wilhelm and his court, but confines himself almost exclusively to Prussian policy, *i.e.* the diplomatic relations and the intercourse of Prussia with the other powers. Perhaps he has done this too strictly, as without altering the main character of his work he might have made it more attractive by noticing many individual traits of character from the numerous sources at his command—and this all the more since the mere diplomatic negotiations were by no means the decisive element in Prussia's history at that time. The state was not powerful enough to determine the course of European politics, and the king was not so much a politician as an administrator. His importance lies not in his external action, but in such an arrangement and concentration of the kingdom's internal resources that his successor could employ them successfully abroad. But though the ordinary reader, especially in foreign countries, may find it difficult to master the book, yet the historian will be not less grateful for Droysen's work, drawn as it is from a thorough investigation into the Prussian archives, which will not need to be made again, though some supplementary notices may be added from other state-archives. Foreign enquirers also will find valuable material here collected, especially for English history—the possession of Hanover connecting England and Prussia closely together.

The first two books contain an account of the Northern War, and that of the Spanish Succession, the latter of which was drawing to its close when Friedrich Wilhelm began to reign. By the treaty of Utrecht, 1713, Prussia obtained in Upper Guelders a long desired addition to her Cleve-Westphalian possessions. It was an advantage too that the king was enabled to concentrate his whole power on the north. The stubbornness of Charles XII. armed not only the Russians and Danes, but even his admirer Friedrich Wilhelm against him, and in 1715 the conquest of Rügen and Stralsund proved the military power of the young state and its new army. The treaties which Sweden made after Charles' death

with Prussia and Russia destroyed her supremacy in the Baltic. Nor could the fruits of victory be wrested from the king as they had been once from the Great Elector. Prussia won the inestimable possession of Fore-Pomerania, Stettin, and the mouths of the Oder. Droysen has gone minutely into the negotiations of this period with the emperor, Russia, England, Hanover, Poland-Saxony. The petty and complicated intrigues of that age contrast strongly with the negotiations of the present day, when the broad interests of great nations are confronted with each other. It would be well for the reader to gain a general view of the subject from Ranke's *Nine Books of Prussian History* before he enters into the labyrinth of detail which Droysen has had to disentangle. This is especially applicable to the last book in the first volume (1721-7), in which our author considers the position of the leading German powers, complicated as it was by the fact that their foreign possessions were more important than their German provinces. Hanover was united with England, Saxony with Poland, Austria with Hungary and with Italian and Slavonian provinces, Brandenburg itself with "Prussia" (in the original sense of the word). But here lay the difference. Though the land which gave the title of the crown lay outside the German empire, yet it was in reality German, and though materially adding to the strength of the electorate (Brandenburg), yet not important enough to remove the centre of gravity beyond its limits. This happy union of "Prussian" and German interests may be regarded as one main cause of the growth and development of the new state. Naturally the rising greatness of such a vassal was not looked on favourably at Vienna. What would it be when, on the dying out of the house of Pfalz-Neuburg, Prussia by the compact of 1660 would gain Jülich and Berg, and therewith a very important position on the Rhine? The acquisition of this inheritance, contested as it was by the line of Pfalz-Sulzbach, formed the cornerstone of Friedrich Wilhelm's policy; and the impossibility of getting his claim recognised at Vienna was the chief motive which induced him to join the political union which after the great change in the European system of alliances in 1725 was formed by England and France against the emperor and Spain. Ranke was the first to publish (*i. 210*) the secret article in the treaty of Hanover, September 3, 1725, between Prussia, France, and England, by which the two great powers agreed to support the king's claim to the Pfalz-Neuburg inheritance; Droysen has brought to light all the details of this noteworthy agreement. The king however, whose German patriotism of itself disinclined him to foreign alliances, found his expectations disappointed. Holland did not wish the Prussian position on the Rhine to be strengthened; England and France could not be really relied on; and so Prussian policy soon took the opposite direction. The transition point lay in the closer union now formed by Prussia with the new Northern power, which had already under Peter the Great taken a distinct line against the policy of England. October 3, 1726, a treaty was made with Russia; and on the 12th of the same month Seckendorf, whom the emperor had sent as extraordinary ambassador to Berlin, succeeded in bringing about a preliminary treaty between Prussia and Austria—the main point again being that the emperor would favour the Prussian claims on the Rhine. Though this change has exposed the king to the charge of vacillation and fickleness yet it gave his policy a fixed direction for a number of years. Seckendorf's ability, aided by the influence of Grumbkow, the king's favourite, and the well understood interests of the two states, held them together. The book which treats of the alliance with the emperor, 1727-32, shows us how the preliminary treaty

of 1726 was confirmed by the formal alliance of December 23, 1728. Prussia acknowledged the Emperor Charles VI.'s Pragmatic Sanction, by which, on the male line of the Hapsburgs dying out, all the Austrian possessions were to be inherited by Maria Theresia, the heiress of the house; and in case of need Prussia was to support this arrangement with 10,000 men. In return the emperor gave up his claims on Berg to Prussia, and agreed that the king should put himself into possession on the dying out of the Pfalz-Neuburg line. Every one knows what came of this, how the king never got Berg, and how Frederick the Great upheld the Pragmatic Sanction. But Austria meanwhile reaped the advantage that Prussia henceforth supported the imperial interests. After Friedrich Wilhelm's journey to the Rhine in 1730, Prince Eugene wrote to Seckendorf that the king had acted as a true friend of the emperor and with a zeal for him which no man in the emperor's own pay and service could have exceeded.

Consequently the king's relations to the emperor's opponents, and especially to England, became more and more unfriendly, and all the more so owing to the family relations between them. In George I.'s time, while friendship existed between the two closely related courts, a double marriage had been planned, one between the Prince of Wales and the Princess Wilhelmine (afterwards Margravine of Baireuth), and another between an English princess and the Crown Prince Friedrich. The queen and her children were set on this plan, and the king also shared the wish. Now, however, that his hated brother-in-law, George II., sat on the throne of England and Hanover, and their political interests became more and more opposed, it became in the king's eyes more and more dangerous to the peace of his state and his family that the crown prince—already a source of anxiety to him—should be influenced by and partly dependent on a foreign power. All that followed, the family quarrel, the prince's flight in July 1730, the execution of his friend Katte, his own danger of death, is too well known to English readers from Carlyle to need further mention. Droysen too has only gone into it so far as was necessary for connecting the family quarrels with political proceedings, and to show that the king did not oppose the marriage from mere despotic caprice, but on definite political grounds.

Even after the reconciliation with the prince and his marriage with Elizabeth of Brunswick-Bevern, the king's irritation against England continued. But his relations to the emperor also became gradually troubled. The policy of the court of Vienna, cunning rather than prudent, now tried to diminish the price given for the treaty of 1728. Still in January 1732, the king seriously endeavoured to get the Diet to ratify the Pragmatic Sanction, even against the opposition of Bavaria, the Palatinate, and Saxony; but in June he found by a conversation with Seckendorf that the court of Vienna wanted to limit his claims on Berg more than he could allow. To make matters certain, he brought about a meeting with the emperor, and the conference at Prague, August 1-5, 1732, became the turning-point of the so-called "eternal alliance" with Austria. Droysen is the first to point out the true significance of this. Earlier writers, deceived by letters and the outward festivities, have seen nothing here but peace and friendship. In reality Friedrich Wilhelm went back to Berlin with the feeling that he had been tricked; for the emperor and Prince Eugene had wrung from him grievous concessions; in particular he had to renounce his right to Düsseldorf. This disagreement of the two powers injured Germany in the following years—as so often in later times. When Augustus II. of Poland and Saxony died in February 1733, the war of the Polish Succession broke out. The weak and

fickle policy of Austria led her, under Russian influence, and against her own interests, to support Augustus III. in opposition to the rightful King Stanislaus Leszinsky, though she had no more allies, while France and Spain, under the prudent guidance of Cardinal Fleury, were united against her. Of course the King of Prussia could not wish to strengthen a dangerous rival by continuing the union of Poland with Saxony, notwithstanding that he offered to maintain the Rhine frontier with 50,000 men. But this offer was refused from jealousy of the growing power of Prussia, and the Austrian court merely demanded an auxiliary corps of 10,000 men, under the treaty of 1728. The folly of all this was soon shown by the wretched mismanagement of the wars in Italy and on the Rhine. As so often, so now Germany had to pay the penalty by giving up Lorraine to compensate King Stanislaus for the loss of Poland, the previous Duke of Lorraine, Maria Theresia's husband, receiving instead the grand-duchy of Tuscany. This ill success naturally did not add to the friendship of the two powers. At Vienna great part of the blame was laid on Prussia, and less regard than ever paid to the stipulations of 1728. It even became known at Berlin that secret negotiations were being carried on with Prussia's rivals of Pfalz-Sulzbach. At length the king, prematurely old (he had been dropsical since 1735), saw himself obliged to return to the point from which he had started. On April 5, 1739, a treaty was made at the Hague with France, which guaranteed to Prussia at least a part of its claims on Berg—Düsseldorf, however, and the southern districts excepted. The king's feeling against Austria was at its height. "Here is one who will avenge me," said he, pointing to his son, the crown prince.

One cannot call the king's policy brilliant. It is often said that with his resources he might by bold decision have obtained great advantages, whether against Poland, Austria, or Sweden. Droysen has rightly avoided meddling with such combinations or proposing a task for the king which did not suit either the good or the weaker peculiarities of his character. What lay in him to do, that he did with rare energy and success; and if the fortune of a man is to be looked for in his solution of the problem set before him by nature, then was this king one of the most fortunate rulers. He nearly doubled the power of Prussia. His army and treasury were the envy of his neighbours; the town population of the Mark increased from 100,000 to 206,000; Prussia (in the narrow sense) and Lithuania were, when he began to reign, so to say, dead, but now (as Seckendorf admiringly said) had arrived at the same point of culture as Germany. "The body of the state," with these words Droysen concludes his book, "its mechanism, its rule and form were there—a work of art, like Pygmalion's clay image. What was wanted was what this king could not give, the Promethean spark." How this spark was kindled, Droysen will show us in the next volumes, which may be expected soon.

One word on the supplementary volume. It offers us criticisms of the contemporary authors, Manteuffel, Rousset, Lamberty, Fassmann, Mauvillon, Martinière, the Margravine of Baireuth, Pöllnitz. The two last are of especial interest. The Margravine's *Memoirs* appeared for the first time, and in a double edition, at Stuttgart and at Brunswick in 1810. Their genuineness has been often doubted. But the original MS. with the Margravine's own corrections was obtained by Pertz in 1850 for the library at Berlin. Droysen, however, shows by several instances the amount of error contained in these notices, dictated by an almost inconceivable spirit of bitterness and hate against her father and brother. Amongst the very interesting original documents here given we find a pretended "Memorandum of the Holy Congregation of

Cardinals," in 1735, aiming to reconcile all Catholic powers with the object of crushing heretics. Ranke has used this document, i. 419, and Droysen tries to prove it genuine (in the *Proceedings of the Berlin Academy* for June 1869). But I must confess that his reasons have not convinced me; and I have no doubt that it was one of those satirical falsifications so common in the eighteenth century. Manteufel, the Saxon ambassador at Berlin, in writing to his minister, Count Brühl, February 28, 1738, rightly characterizes it as "ouvrage de quelque esprit oisif, mutin et ennemi personnel de la cour de Rome." HERMANN HÜFFER.

**Ranke's Collected Works.** [*Leopold von Ranke's Sämmtliche Werke.*] Vols. I.-XXI. Vol. XXIII. Leipzig: Duncker und Humblot, 1867-1872.

**The Origin of the Seven Years' War.** [*Der Ursprung des Siebenjährigen Kriegs.* Von Leopold von Ranke.] Leipzig: Duncker und Humblot, 1871.

**The German Powers and the Confederation of the Princes, 1780-1790.** [*Die Deutschen Mächte und der Fürstenbund. Deutsche Geschichte von 1780 bis 1790.* Von Leopold von Ranke.] 2 vols. Leipzig: Duncker und Humblot, 1871, 1872.

THE great master of modern historiography in Germany, although he has lately entered on his seventy-sixth year, still continues to issue work after work with wonderful rapidity. His stores seem to be quite inexhaustible; and in the full enjoyment of mental vigour the habit of work, which in fact has been the strength of a long life, does not show as yet the least sign of giving way. It is true that Ranke has discontinued his lectures in the university of Berlin since last summer, but merely in order to pursue his literary labours with greater effect. The retirement from his professorship has left a blank which it will be very difficult to fill up again, since at that seat of learning there remains at present nobody who, in a similar degree, combines the same perfection in critical method, the scientific basis of the study of history, with a corresponding taste and artistic manner of exposition. When Ranke published his first book, now about forty-eight years ago, and when he soon after began teaching, he not only adopted the systematic method of research originated by F. A. Wolf in philology and by Niebuhr in history, but he generalised it, and made it the firm backbone for study in any department of universal history. A multitude of pupils have since gone forth from his school, so that there is hardly a chair of history in any of the German universities which is not filled by one of them. There are numberless teachers, too, in the middle-schools of Germany, who either attended his classes or more indirectly owe their knowledge and capacity to Ranke's example. The principle of sifting and weighing by comparison the value of primary and secondary sources of knowledge, and of discovering their literary pedigree, being originally taught with especial reference to mediaeval subjects, as they were multiplied by the contemporary progress of the *Monumenta Germaniae Historica*, has been transferred successfully to the history of all times and of every country. There is no doubt that Greek and Roman historiography, especially since its new epigraphic material has been coming to light, has received an invigorating impulse from the methodical handling of the chronicles, annals, and charters of the middle ages. And the same may be said with regard to the history of the four last centuries, the original sources of which were buried more or less in the archives of the different countries. That the most valuable records of the policy of modern states have only been opened to the scholars within living memory is owing generally to the progress of enlightenment of the age; but it would scarcely have taken place to the extent, and with the amount

of success it has, if there had not been "path-finders" and forerunners like Ranke. Having selected just the history of the sixteenth and seventeenth century for his chief domain, and starting from general points of view, like the connection between the Romanic and the Germanic nations and the papacy, it will ever be remembered how he found his way into the unique storehouse of diplomatic despatches preserved in the vast chambers of the Frari at Venice; and how, in course of time, he mastered also the most valuable contents of the more important collections in Italy, France, Belgium, Holland, England, Germany, and Austria. We doubt whether there is another historian living who has amassed such stores of copies and notes from various places, or who is so competent to give a comparative account of the respective value of each of these record offices.

As an author, Ranke has not been universally acceptable. Some blame him for his objectivity as too cold and unimpassioned. The adherents of political liberalism call him a royalist, an aristocrat, since he writes chiefly from the reports of those who after all were the obedient servants to governments which were despotic without exception. Another very elementary objection misses in his books the entertaining element of detailed narrative, and accuses the superabundance of general view and of argument. The scholar, however, will understand that all these points objected to spring from first principles. In spite of a certain individual mannerism, Ranke approaches the classical model of clearness and conciseness, as near as any contemporary historian, just on account of this objective treatment of his matter. He so little misses the moving spirit in history by overlooking it that in fact there will be few authors who, with the same impartiality, and without any apparent predilection for any political or religious opinion, explore the very mines of literature as well as of political economy, a subject in which both the ore and the dross of a new period generally lie close to one another. Ranke in his ripe age has more than once sat in judgment on his equals, and has invariably done justice to political opponents in the most impartial spirit. We would especially refer in this respect to his short commemorative speech on Gervinus, delivered in Munich on the 27th of September last, and printed in a recent issue of Sybel's *Historische Zeitschrift*, as an excellent specimen of characterization untinged by any subjective prepossession, and, by the way, well worth the English reader's attention on account of a comparison between the political bias of Gervinus and of Lord Macaulay.

The collected works—an edition commenced at the jubilee of the Professor's doctorate—have been progressing steadily, four or five volumes being issued in the course of the year. Each separate work has been revised most carefully by the author himself, so that the collection includes the latest editions of the history of the reformation in Germany and of the French and the English history. It appears that to each of these works another volume has been added, partly based upon new materials, and partly consisting of some extracts from the choicest accounts still in manuscript. In this manner the historical review of the empire is continued in volume vii. through the reigns of Maximilian II., Rudolph II., and Matthias, tracing the causes of the Thirty Years' War. The extracts added to the former editions of the history of France from the inimitable and racy letters of the excellent Duchess of Orléans, Elisabeth Charlotte, to her aunt, the old Protectress Sophia, at Hanover, have now developed into a separate volume (xiii.). And if we are not very much mistaken, there will be some similar enlargement of the English history, which in its title has dropped the words, "chiefly during the sixteenth century," reserving this predicament exclusively for the next following century.

Vol. xxi. contains the end of the narrative of George II.'s reign, and the first portion of the usual *Analecta*, amongst which a recension of Cromwell's most important speech on the 13th April, 1657, discovered in a British Museum MS. (and much more distinct than the copy reproduced in Mr. Carlyle's work), as well as Ranke's own very elaborate papers on Clarendon, on the autobiographical notices of King James II., and of Burnet's *History of His Own Times*, deserve a special mention. In the appendix we meet with some documents from the royal archives at Berlin, never printed before, and referring to the military assistance which was sent in 1688 by the Elector of Brandenburg to William of Orange, when starting on his ever memorable expedition. The rest of the *Analecta* will probably fill vol. xxii., which is still wanting, with enlarged extracts from the still, in great part, unpublished correspondence of William III., and from the highly interesting despatches, written in French, from London to the court of Berlin, by the Huguenot residents of the Bonnet family. They report regularly during thirty-five years, down to 1720, sometimes so accurately that the debates in the two houses of parliament, for instance, during the anxious time preceding and following Queen Mary's death, may be reconstructed much better from this than from any other source. Vol. xxiii., the last which has appeared, contains the third and in the main unaltered edition of the *Life of Wallenstein*. Perhaps the *History of the Popes* which, since Lord Macaulay's essay, and Mrs. Austin's incomparable translation, has become the favourite with the English reader, may be reissued after this, hardly in a new dress, though very probably too with some important documents found since by the indefatigable author.

We have still to notice two very remarkable productions, which appeared separate from the collected works within the last twelve months, and not uninfluenced by the great events of the immediate past. The essay on the *Origin of the Seven Years' War* grew into a complete book out of a paper read several years ago before the Royal Academy at Berlin. Even such an imperturbable worker as Ranke confesses that when, at the outbreak of the war of 1870, all the young men around him were hurrying away to join the army, it was impossible for him to fix his attention on any subject but one cognate in some respects to Prussia's latest and grandest venture. In such a mood he took up again what had been sketched previously, and connected it with the results of the researches made since in the repositories of all the states which had united for the purpose of annihilating Frederick II. Being fully acquainted, from the original correspondence, with the transactions between France, England, and Prussia, he lamented that the Austrian records were still jealously withheld from the public. But fortunately Arneth brought down his most important work on Maria Theresia to the very period. And in the midst of the din of arms the great Prussian historian was at last permitted to search at liberty in the splendid Vienna collections for the still partly hidden secret of the real transactions which took place before 1756 between the Austrian and the French courts, as well as between Vienna and St. Petersburg. The result is a finished example of historical art, the great difficulties of which nowhere appear through the smooth surface. Yet as the secret and hostile conspiracy, from which the great European conflict of the last century originated, had to be followed up in reference to each of the various governments concerned, and without losing sight of the total march of events, a sort of parallel narrative had to be constructed, in which the seams serve as the most natural lines of chronological transition. Ranke has completed this task with such thorough mastery that causes and effects, and

whatever was really at the bottom of a secret of generations, now at last stand out with complete lucidity. The accusations once so violent in many a country, and for a moment in 1866 revived from the Austrian side, that Frederick the Great, by striking the first blow, had wilfully committed the most flagrant crime, will not be repeated again by anybody who acknowledges the evidence of documents. True, there are no actual repetitions in history, and even the most gifted individual dwindles down in comparison with the silently leading forces of destiny, which sway him as well as his opponents. Yet rulers and governments will ever learn from history, and there is no question that, under similar circumstances, they may act according to precedent with a certain degree of security as to the issue. From the appendix, which contains several dissertations on Frederick's own explanations and the respective value of the memoirs of the Marquis of Valori and of the little book of Duclos, *Histoire des Causes de la Guerre de 1756*, it may be mentioned that the often repeated story of an intimate correspondence between Maria Theresia and the Marquise de Pompadour turns out after all to be an entire invention. The empress in later life stated deliberately that she never wrote to the lady, and only made her a single present, "plûtôt galant que magnifique."

Even more elaborate and circumstantial is the last work on our list: *The German Powers and the Union of Princes—German History from 1780 till 1790*. Who can deny that here, too, the most significant phases of a transient experiment are illustrated by the successful termination of a long and eventful development? The reason why no sufficient notice has hitherto been taken of an attempt made by Frederick II. to unite the German governments in a kind of national federation is simply to be found in the tremendous effect of the French revolution and its consequences, by which the nation was almost torn to pieces. We are here introduced to a period in which the old Empire still existed nominally, though it must be confessed that all its real functions were already extinct, when, with the exception of the short warlike bustle of 1778, thanks to the King of Prussia, Germany enjoyed a most welcome internal peace, coinciding with the brilliant resuscitation of her national literature. This is strikingly, but far too shortly, alluded to in the sixth chapter. Once more we meet with the old king hero, but now as the veteran guardian, who keeps steady watch on events at home and abroad, and with consummate skill either wards off their evil influences from his subjects altogether or allows them to reach his realm fraught with some palpable advantage. Next to him rises the Emperor Joseph II., no longer proud to call himself Frederick's pupil, but after his mother's death, in his full-grown tempestuous ambition and feverish effort, to reform not only Austria, which in spite of her many races is tending to become a geographical unity, but church and empire as well. Old Prince Kaunitz, Joseph's chief adviser—he, too, the guardian of a traditional policy—is a figure depicted by Ranke in his best style. We can only mention that the emperor became the ally of Catherine II. in her schemes against Turkey and Poland; that Frederick was in danger of losing that same alliance which already formed an article in the political creed of Prussian statesmen of the type of Count Hertzberg; that the emperor wished to swallow up the electorate of Bavaria, the impotent incumbent of which he proposed to indemnify with the Austrian provinces in the Netherlands; and that, moreover, by certain revivals of his obsolete imperial prerogative he roused the greater number of the German princes against himself personally. Thus it was that in the last year of his life Frederick II., leaning upon the Dutch Republic and upon George III. in

his capacity both of King of England and of Elector of Hanover, promoted the Union of Princes, with the distinct recollection of what the Union of Smalcald had purposed against Charles V., but with a certain national tendency more characteristic of our own age. The steps to the confederacy and its completion, the share which the Prince of Prussia as the heir-apparent and other princes, especially the spirited Charles Augustus, Duke of Weimar, took in it, are most carefully delineated. The narrative pauses for a moment to see the great Frederick die at Sanssouci and Frederick William II. ascend the throne, who, as long as Hertzberg stands at his side, is sincerely inclined to continue in the steps of his eminent predecessor. These were marvellous days so shortly before the awful Paris catastrophe. While Prussia and England reinstated once more the Stadtholder in Holland, while Catherine and Joseph attacked the Turks with their combined forces, the princes of the empire thought of reforming it under a Prussian protectorate, and Prussia herself, in a triple alliance with England and the Dutch Republic, helped to stay the destruction of the Porte. It will be remembered how Joseph II. ended in exhaustion, how the Belgian provinces rebelled against his autocratic innovations, how the Hungarian and even the estates of Lower Austria threatened the same. The death of Joseph II. involved a complete change of policy, for by the treaty of Reichenbach, Prussia and Austria, after their long quarrel, for the first time joined as allies against the dangers rising in the West, and still continuing in the East. The thirty chapters of the book are as usual illustrated by a very rich collection of hitherto unpublished documents. Most curious are the extracts from Frederick II.'s correspondence with the Duke of Brunswick, referring to the state of the world in the beginning of 1782. He hits off most sarcastically the pitiable capacity of the various sovereigns, and alluding to the approaching peace which England has to submit to with her revolting colonies, he writes: "The King of England, after concluding it, will come down with all his might upon the French and Spaniards. I am offered to mediate the peace between them, but under what conditions? Are the Americans to be free or subdued? Can Holland conclude peace without receiving back her lost colonies? Is Lord Bute to continue behind the curtain the leader of affairs? In that case, nobody would have confidence. The abominable corruption which pervades the parliament and the whole nation has degraded the sentiment of honour and the republican nerve which for a long time have given such examples of courage and generosity." And after accusing the prodigious wealth accumulating in England, he continues: "Vous dans votre Basse-Saxe et moi dans ma sablonnière nous n'avons rien à craindre que l'opulence dégrade les sentimens de nos concitoyens, et je préfère notre simplicité, même notre pauvreté, à ces maudites richesses qui pervertissent la dignité de notre espèce." However, a few years later secret articles were signed, which are now printed for the first time. They were contracted on the 13th August, 1788, by the prudent advice of William Pitt, between England and Prussia for the sake of peace in the East. Two sets of documents refer to the confederation of the German princes from 1784 down to 1788, two others contain the pith of the correspondence of Prince Kaunitz with Joseph II. and Leopold II. Many letters from the hand of Frederick William II. which conclude the last volume are well adapted to show this prince in a much more favourable light than is usually the case.

In conclusion, one more remark. It strikes us that the author in his venerable age, writing with very striking emphasis and almost youthful vigour, has dropped his former reserve in dealing with modern subjects. With

regard to the Oriental question, he ventures to hint at the fact that Frederick William II.—"a prince who embraced mankind with human kindness"—had been likewise in favour of seeing a Greek empire restored at Constantinople (i. 31), and that by the Crimean war it was intended to nullify what had been settled seventy years before (i. 162). But nevertheless he remains faithful to his principles, which combine a scientific method with a conservative conviction, which a great success has approved. So he says most emphatically in the preface: "It would be impossible not to have one's own opinion in the midst of all the struggles of forces and ideas, from which spring, in fact, the most decisive transactions. Yet the principle of impartiality may be guarded in spite of that: the meaning of which is that the respective position of the contending powers is recognised, and that the individual relations of each of them are duly estimated. They may be observed separately in themselves, in their contraposition, in their conflict. By their very opposition, the great facts are brought about, and the general development of events unfolded. Objectiveness is at the same time impartiality." It will be most interesting to see such principles applied by Ranke himself, if rumour says right, to the history of Prussian policy, both under Frederick William III. and his son, the late king. In fact, the Hohenzollern dynasty, among other pieces of good luck, has reason to rejoice in the possession of its historiographer royal.

R. PAULI.

### Intelligence.

The number of students at the Strassburg University, which we stated on excellent first-hand authority to be 1500, now dwindles down to about 200. Apropos of the recent inauguration, a very instructive little paper has been composed and distributed to the crowd of learned and official guests by the secretary of the Academical Senatus, Dr. A. Schricker, *Zur Geschichte der Universität Strassburg*. It appears from the records, and chiefly from the matriculation books, that the old university, which was twice incorporated by the emperors Maximilian II. and Ferdinand II., since the days of its founder, the celebrated Johannes Sturm, combined the position of a local high-school, in which a remarkable amount of native talent both learned and taught, with the attractions of an academy for the nobility of the empire. During the era of the Reformation Strassburg offered a neutral ground to the followers of Luther and of Bucer and Calvin, as well as to the later humanists of the adjacent countries. And even after its annexation to France, the German university was confirmed in all its privileges by the conqueror. Princes and diplomatists of European name continued to crowd the classes of professors, because at the same time they had the advantage of becoming acquainted with the polite manners of the French as they slowly encroached upon the ancient imperial city. Cobentzl, Metternich, Montgelas, were students at Strassburg; and so was Goethe in 1770, as all the world knows. His autograph in the book is facsimilied thus: "Joannes Wolfgang Göthe Moeno-Francfurtensis, logiere bey Hr. Schlag, auf dem Fischmarkt d. 19 Aprilis." Between 1785-87 Strassburg was still an educational resort of international celebrity, where among 125 young men of the best families were inscribed 17 Germans, 16 French, 23 English and Scotch, 3 Italians, 11 Danes and Swedes, 5 Courlanders and Poles, 44 Russians and Livonians. This was the natural result of its geographical position, on the confine or, as it were, on the high-road between two nations. Strassburg, though it lost its own political existence in 1681, had scarcely been injured nationally by the French monarchy. This began when the emissaries of the Convention, St.-Just and Lebas, arrived within its walls to wage their sanguinary war against all "aristocrats and fanatics." In the Journal of the old Faculty of Divinity, whose members too had to suffer in prison and exile, the single word TERROR! forms a striking entrance of the year 1793. On the 29th May, 1794, it was resolved by the civic council, in order to conquer "l'esprit de localité," and to strangle "l'hydre de germanisme," that the university should be suppressed. As its reminiscences are not gone, there is indeed a fair hope that they will revive together with the new foundation, and that the people of Elsass in another generation will be proud again of their German seat of learning.

Dr. Gustav Parthey, who died at Rome on the 2nd April of this year, was the grandson of Friedrich Nicolai, the learned philistine and well-known contemporary of Goethe. Parthey, who had inherited from his grandfather considerable property and the old Nicolai publishing firm at Berlin, belonged to the earlier generation of travellers and

Egyptologists in Germany. He has described his travels in Sicily in two learned volumes, 1834 and 1840, and made himself known by a very creditable dictionary of the Coptic language, together with a number of other works and dissertations referring to the history, geography, and philology of ancient Egypt: e.g. *De Philis insula ejusque monumentis Commentatio*, 1830, and *Das Alexandrinische Museum*, 1838. In conjunction with the late Dr. Pinder, after carefully collating all the principal manuscripts, he re-edited the *Itinerarium Antonini*, 1848, and the *Geographus Ravennas*, 1860. To the same predilection for geographical and topographical researches must be ascribed his editions of Pomponius Mela, 1867; of the curious mediaeval tract *Mirabilia Romae*, 1869; and of *Diculi Liber de mensura orbis terrae*, 1870. Art-collectors are indebted to him for a very useful catalogue of Wenzel Hollar's prints, *Beschreibendes Verzeichniß seiner Kupferstiche*, 1853 and 1858. He has bequeathed his own large and valuable library to the Instituto di Corrispondenza archeologica at Rome.

The Prussian government, together with the German Reichstag, has recently made a grant for the erection of an Institute of Archaeology—like the well-known one on the Capitol—at Athens, where a small knot of German scholars will soon gather to watch the principal excavations in Greece, and to decipher the newly found inscriptions.

Dr. Paul Scheffer-Boichorst, author of Kaiser Friedrich's I. *Letzter Streit mit der Curie*, Berlin, 1866, who has reconstructed the *Annales Patherbrunenses*, and has written some learned dissertations, chiefly on the sources of the twelfth and thirteenth century, has been called by Dr. Pertz to assist him and Dr. W. Arndt in the editorship of the *Monumenta Germaniae Historica*.

According to an advertisement of E. S. Mittler und Sohn, at Berlin, the first instalment of the official work on the last great French-German war will be soon forthcoming. It has ever since been most carefully prepared by the general staff of the Prussian army, under the superintendence of Field-Marshal von Moltke himself, and with the active assistance of the most distinguished officers who were on the staff of the various German army corps. The bulk of materials, which had been collected incessantly in the very actions of the campaign, is said to be enormous, and at all events required a strict and methodical sifting. The subscription price is 18 thalers.

We must give a few words of encouraging recognition to Mr. W. R. W. Stephens' *Life and Times of St. Chrysostom* (Murray), which is singularly objective and historical in its tone. Biographies are too often written with reference to the sayings and opinions of their subjects as criticised from a modern point of view. Neander's *Life of Chrysostom* is perhaps liable to this charge. Mr. Stephens is conscious of the difficulty, and has, we think, carried out his leading idea well. Church's *Life of St. Anselm* may have served to rouse his emulation, and Dean Hook's son-in-law may feel a sort of natural impulse to write the history of the great archbishop of the Eastern Church. The narrative is clearly given, and Mr. Stephens has cautiously abstained from introducing modern points of view, which, after all, are utter anachronisms. Everything is so merely in the germ in Chrysostom's time that he is not of so much use in modern controversy as might be expected. Roman Catholic writers wonder how he and "St. Basil could allow themselves to speak of the Virgin Mary as they do;" a Calvinist finds him very unsatisfactory about predestination and election. Is it not time to deal with church history as we have long done with philosophy, and cease to read modern ideas backwards into our authors? Chrysostom's actions must all be considered from the point of view and the necessities of his age. He became an ascetic monk; but the excessive corruption of the great cities drove most men who wished to lead a devout and honest life into retirement. In fact we may almost use the prevalence of monasticism as a barometer to weigh the corruption of an age. As soon as a good life becomes fairly possible in society, monasticism declines; till then it exists by its own necessity. In our own days the necessity may still exist for individuals; it has ceased for whole classes of men. But the system was always accompanied by great evil. "Nothing," says Chrysostom, "had inflicted more injury on the moral tone of society than the supposition that strictness of life was demanded of the monk only." The system withdrew from the earth those who were meant to be the salt of it. He trusted the time might come when these refugees would be able to return to the world with safety. Similarly the feeling as to marriage or celibacy was largely influenced by the generally degraded condition of women in that age. The early life of Chrysostom under the charge of his mother Anthusa may be compared with that of Augustine under Monica; very tenderly does Anthusa appeal to her son not to deprive her of his protection, companionship, and help, who had devoted her life to him by retiring into a monastery. He studied under the heathen rhetorician Libanius, who would have made him his successor in the school of rhetoric "but for the Christians having made him a proselyte." And to the last his Homer and his Plato influence his writings. When he says that the star of Bethlehem, which came and "stood over where the young child was," must have been not a star, but some one of the heavenly powers which shot down from heaven to give the sign, was he not thinking of *Iliad*, iv. 75, where a heavenly power shoots down "like a star" to earth as a sign to

Greece and Troy? His work at Antioch and Constantinople is described at length, and good illustrations selected of the manners of the time; the baths and theatres, the dresses and fashions, everything contributes some minute touches to the picture of licentious luxury all around him. His later life, his persecution by the Empress Eudoxia, and by Theophilus of Alexandria, and his death in exile, are drawn out in a sort of natural sequence. For this part, Thierry's late articles on Eudoxia in the *Revue des deux Mondes* have been of essential service. We learn from his homilies many curious details of church development. Thus the great sermon on Christmas Day, 386, tells us that this festival was not originally celebrated in the Eastern Church; it had been adopted from the West, and in Antioch at least, less than ten years before the year of Chrysostom's discourse. The tone of Chrysostom's commentaries is especially remarkable. He interprets the sound sense and judgment, adhering closely to the literal and historical meaning of the text. It is quite refreshing to read his homilies; they stand out in such contrast to the unreal fancies of so many of the early writers. The last chapter contains a survey of Chrysostom's theological teaching, and is clearly put together. The value of such a survey is to show us that theology may be cast into a very different shape from what we are accustomed to in the West. "Merit," "satisfaction," "decrees," "forensic justification," "imputed righteousness," are terms which do not occur in the writings of the Greek theologian, because they are the expression of ideas in which he felt no interest; they are the offspring of the Roman mind in which legal ideas were dominant. Burnet found this out, and it had such an effect on him that he says, in the preface to his *Exposition of the Thirty-Nine Articles*, "I follow the doctrine of the Greek Church, from which St. Austin departed, and formed a new system."

### Philology.

- Mélanges égyptologiques. Troisième Série. Tome I. Par F. Chabas, avec la collaboration de MM. S. Birch et Ch. W. Goodwin. Paris et Châlons-sur-Saône.

In this new part of his *Mélanges*, M. Chabas, who is the author of almost the whole, mainly devotes himself to texts bearing on the administration and civil life of the ancient Egyptians. The principal essay is an analytic translation of the Abbott Papyrus in the British Museum (already published by the Trustees, with a valuable introductory notice by Dr. Birch), a document recording an official enquiry in the reign of Ramses IX. of the 20th Dynasty into certain acts of spoliation in the royal and other tombs at Thebes. This subject naturally suggested to M. Chabas, who is always resolute in his determination to obtain as positive results as the nature of the case admits, a thorough enquiry into the administration of the laws under the Pharaohs. To this we owe a very interesting discussion as to the precise meaning

of the Judicial Papyrus of Turin, in reply to the explanation of M. Devéria. That lamented scholar had published this papyrus with a translation, which made the Pharaoh, Ramses III., to whose reign it relates, pre-judge persons accused, and, further, taking the place of the judges, himself pronounce judgment on a certain number. Such a case would be directly contrary to the statements of the classical writers on these matters, which, as M. Chabas well remarks, were based on notorious facts, not on the observation of persons unacquainted with the native language. Without, however, laying any undue stress on this evidence, he analyses the text translated by M. Devéria, and comes to a very different conclusion, for he shows clearly that there was no direct intervention of the king in the case. It might seem surprising that so wide a difference of opinion should be possible between two accomplished Egyptologists, were it not well known that the texts of the hieratic papyri are generally far more difficult than those written or engraved in hieroglyphics, from the carelessness and caprices of the scribes, and the occasional extreme obscurity of the more cursive forms of the character. We have often to deal with the running-hand notes of an Egyptian scribe, written very fast and meant only for his own use. It is, therefore, no discredit to the memory of a singularly able scholar that he should sometimes have found himself unequal to a task which even M. Chabas, whose knowledge and acuteness in this department are unequalled, occasionally finds almost beyond his powers. But it is precisely this difficulty that renders the study of the hieratic papyri the most fruitful in the domain of Egyptology, at least so far as the language is concerned. The student is compelled to compare all accessible documents, to pay the utmost attention to grammatical niceties, and not least to refer constantly to the vocabulary and grammar of Coptic, which of late has been scarcely admitted to its rightful place in the enquiry.

Passing from the introduction to the analysis of the document, many points strike the reader which show the wide bearing of Egyptology. In the papyri of the Ramses age, the occurrence of Semitic words transcribed in Egyptian has been frequently remarked. This was an influence like the successive influences of Italian and French on English. The similarity of certain Egyptian roots with Semitic ones has not been as generally acknowledged. It is, however, a phenomenon equally observed in our own language in the case of roots of common origin with Italian and French ones. Hence we find M. Chabas objecting, "On a pensé que le mot *Sar* [seigneur] avait pu être emprunté par les Égyptiens aux langues araméennes; mais on le trouve sur les plus anciens documents, c'est-à-dire à une époque où les rapports de l'Égypte avec l'Asie-Centrale ne peuvent encore être distinctement entrevus, et où par conséquent des emprunts de cette nature ne peuvent être supposés que sur des présomptions tirées de l'homonymie, ce qui ne saurait suffire" (p. 162). Here a certain similarity between two languages pointing to a common descent, in part or whole, is not recognised, and nothing is admitted beyond direct borrowing. But surely Semitic words in Egyptian, written with full vowels, like *marukabuta*, a chariot, מְרֻכְבָּה, *shakaru*, a shekel, שֶׁקֶל, and Egyptian words in Hebrew, like the proper names פִּינְחָס, e.g. *Pa-nehsi*, and הֶרְנֶפֶר, *Har-nefer*, are directly borrowed, preserving their original forms, and have nothing to do with roots common to both Egyptian and Semitic, which have proper Egyptian and Semitic forms, like *ptch*, פְּתַח, and *khem*, חֶמֶס.

It is not alien to this subject to quote a very curious illustration of a difficult passage in Genesis. M. Chabas is noticing the Egyptian mode of taking an oath. "Il prononça

alors le serment ordinaire: Par la vie du Seigneur Vie-Santé-Force, en se frappant le nez et les oreilles et se plaçant sur le sommet [or "on"] du bâton. Il s'agit du bâton, insigne habituel des Oérous [magistrats], que le magistrat tenait étendu pendant la formalité. Le prévenu montrait, par cette attitude et par ces gestes, sa soumission envers le magistrat et la connaissance qu'il avait des châtimens par lui encourus, si sa culpabilité venait à être démontrée. Certains crimes étaient en effet punis par l'ablation du nez et des oreilles, et le plus grand nombre des délits par la bastonnade. L'histoire du patriarche Joseph, dans la Bible, est fortement imprégnée des idées égyptiennes; elle nous présente une épisode qui a quelque analogie avec celui que nous venons d'analyser. Sentant sa fin prochaine, Jacob fait jurer à son fils qu'il ne le fera pas enterrer en Égypte. Joseph prêta ce serment à la manière des anciens Hébreux, c'est-à-dire en plaçant sa main sous la cuisse de son père. Mais Jacob ne méconnaissait pas l'importance du maître de l'Égypte; le serment prêté, il s'incline sur la tête du bâton de son fils, וַיִּשְׁתַּחוּ יִשְׂרָאֵל עַל-רֹאשׁ הַמָּטָה (Genèse, xlvii. 31)."—Pp. 91, 92. This is at least a plausible explanation of a passage in which the Septuagint reading, supported by the New Testament, has never been either disproved or explained. Of course, "de son fils" is only a Targumic addition by M. Chabas. The Septuagint has ἐν τῷ ἄκρον τῆς ῥάβδου αὐτοῦ.

The second essay, similar in subject to the first, is the joint work of Dr. Birch and M. Chabas. It relates to a papyrus which appears to be of the time of Setee II. of the 19th Dynasty. One point of great interest is raised by it. The culprit to whom it refers was saved from punishment by appealing to "an individual called Mési, of whom neither the titles nor the functions are indicated."

"Ce Mési était évidemment un personnage très-influent, puisqu'il réussit à préserver Panéba des poursuites du Gouverneur. Nul doute qu'il n'appartint à la famille royale. M. Lepsius a rangé à la suite des princes de la famille de Ramsès II un fils royal de Coush, basilico-grammate, du nom de Mès. C'est vraisemblablement le même personnage." (Pp. 190, 191.)

This observation, accentuated by a note drawing attention to the fact that the governor was among the highest Egyptian functionaries, is very curious in relation to the story that places the Exodus in the time of Menptah, the father of Setee II., for the name of the powerful individual so strangely mentioned without any title is very like that of Moses. Curiously enough, however, we find at this period two princes of Cush, both bearing the name in question, Mési (Mes-sui?) under Ramses II. and Mes under his son Menptah. (Lepsius, *Königsbuch*, Taf. xxxv. xxxvi.) It may be asked whether the occurrence of this name had anything to do with the fixing the Exodus to this period in the Manethonian story; but there it is said that the Egyptian name of Moses was Osarsiph. The whole subject is full of difficulty. It may, however, be remarked that this interesting joint essay throws light upon the history of the age of Setee II., showing that Egypt was then in a disorganized state.

Among the other essays, that on the Price of a Bull is valuable in reference to the origin of money, and that, by Mr. Goodwin, on an Inscription of the reign of Shabaka, is very important as bearing on the myth of Osiris.

M. Chabas states in the introduction to this volume that he has more essays of his own nearly completed, and others by the friends who have worked with him. Every student of Egyptology must look with great interest to the continuation of a publication conducted under exceptional difficulties, and of more than exceptional value.

REGINALD STUART POOLE.

Germanic Studies. [*Germanistische Studien*, herausgegeben von K. Bartsch. 1. Bd. Wien: C. Gerold's Sohn.]

Of the eight essays contained in this volume—originally written for Bartsch's *Germania*—the most interesting for English readers is that by Karl Regel on the alliteration in Layamon, with some general remarks on the metrical form of the poem. Its main characteristics, according to Regel, are its freedom of structure and its extraordinary development of every kind of rhyme, end-rhyme, internal rhyme (Binnenreim), and letter-rhyme or alliteration. The same tendency is shown in the very frequent repetition of two or more words at the beginning of two consecutive verses, as in *ful swiðe us mai scomien, ful swiðe us mai gromien*—a rhetorical figure which is alike unknown to the older A.-S. poetry and to the Old French original, and was no doubt developed independently by Layamon. Many of his alliterations are also original, as is clearly shown in the case of foreign (Celtic) names, which are almost always introduced in alliterative combinations: *Selemón þe sele and Cadwalan þa kene*, &c. Others again are purely traditional, and these Regel has collected and arranged systematically. He begins with combinations of words of the same root, such as *tale tellen*, which he is probably right in regarding as the most primitive of all, and classes the rest under the different heads of words allied in meaning (*fisc and fæsc*), contrasted combinations (*ord and ende*), and the various combination, of verb, adjective, and substantive. The value of these lists with their almost exhaustive fulness and their excellent grouping, is further increased by the parallels given from the cognate literatures, which not only clear up obscurities of form and meaning, but also show that many of Layamon's alliterative combinations which do not occur in the extant A.-S. literature, really form part of the common Teutonic stock. In most cases of difficulty we fully agree with Regel's explanations; some, however, seem to call for criticism. He translates *wunien on wunsele* by "im Wohnsitz wohnen;" the analogy of the A.-S. *wynburg*, &c. points rather to the meaning "Wohnesaal." In *hunger and hete* the translation "Hunger and Hitze (d. i. brennendes Verschwachen)" seems very forced. Madden, who translates "hatred," has only erred on the side of over-literality: the meaning of the word in this combination is simply "affliction." In the old poetry the ideas of "hostility," "crime," "punishment," and "affliction," are almost controvertible, as will be evident to any one who looks over the passages which Grein has collected under *synn, mordor, nið*, &c. Conclusive evidence is afforded by the Old Saxon *hungar hetigrim*, quoted by Regel himself, which he would alter into *hétgrim*.

Theodor von Hagen's article on the manuscripts of Gottfried's *Tristan* is the first attempt that has yet been made to settle definitely their relationship and critical value. He classes them under two groups, one represented by the Heidelberg and the Munich MSS., the other by the Florentine and a large number of inferior MSS. The two lost MSS. which formed the originals of these groups appear to be of equal authority; hence their readings must be compared systematically, and in cases of divergence it must be settled which of the two prototypes had the better reading. A right understanding of the relationship of the two groups is of especial importance in cases of disagreement between two representatives of the same family. If in such a case one of these divergent readings is supported by the reading of the other group, this reading will probably be the correct one. Thus in 36, 11, the F. group reads *umb kein ander himelriche gegeben*, H. has *umb kein ander küene-riche gegeben*, while the editors have adopted the reading of M. *umb tásent küene-riche gegeben*. But the agreement of H. and the F. group shows that the three first words *umb kein ander* must

be retained, while the *küene-riche* of the prototype of M. and H. may be easily explained as a mere graphic corruption of *himelriche*. The true reading is then *umb kein ander himelriche gegeben*, which, with its peculiar use of *himelriche* in the sense of "Himmelsglück," as v. Hagen translates it, is quite in Gottfried's manner, and is in every way preferable to the commonplace reading of M. This, together with several other instances, shows that much remains to be done before the text of the *Tristan* can be considered as definitely fixed.

The general result of Karl Meyer's article on the "Tellsage" is to enroll Tell in the already overcrowded ranks of the solar myths, while the tyrant Gessler turns out to be nothing more substantial than the clouds and mists which are pierced by the weapons of the sun-god. The other element of the myth—the shooting of the apple from the child's head—he confesses himself unable to explain. We must, however, protest against the depreciation of the apple, of which he says that it "überall nur als an und für sich gleichgültiges Mittel zum Zwecke erscheint." The fact that the apple appears in nearly all the various renderings of the myth—even, as we learn from a note, in a Persian story of the same kind—certainly points to the directly opposite conclusion. It is not impossible that the key to this part of the myth may be found in Idunn and her apples of immortality. It will be seen that Meyer's explanation of the "Tellsage" is thus incomplete and unsatisfactory; we think that the real value of the essay lies in the remarks on the relation between history and mythology, and the importance of distinguishing carefully between the purely mythological nucleus of a tradition and the historical accretions which afterwards modify it, instead of attempting to discover a mythological explanation for every detail—a course which is too often pursued by comparative mythologists, and tends to bring both themselves and their science into discredit.

Of the remaining essays a mere enumeration must suffice. The most important of them is an elaborate and apparently exhaustive account of the syntactical use of the optative in Gothic, by Arthur Köhler. Konrad Maurer's examination of the so-called "Kristinréttir" of king Sverrir leads him to the conclusion that the king had nothing to do with the compilation of the laws in question. "Wetzels heilige Margarete," by the editor; "Hester," by K. Schröder; and "Das niederheinische Bruchstück der Schlacht von Aleschans," by H. Suchier, treat of special points of Middle High German literature. The first two give critical texts of newly discovered poems with literary and philological remarks. Neither of the pieces seems to have much literary merit, although the second is of interest as being the only poetical paraphrase of the Book of Esther that is known to exist in Middle or Old High German, and also on account of its author, whom Schröder proves by the most convincing evidence of style to be no other than the unknown author of the *Pasional*.  
HENRY SWEET.

#### THE LATE PROF. GOLDSTÜCKER'S PAPERS.

##### TO THE EDITOR OF THE ACADEMY.

SIR,—So many public and private expressions of opinion respecting my intentions with regard to the manuscripts of my late brother, Prof. Theodor Goldstücker, have come under my notice, reposing for the most part upon imperfect information, that, as the matter is one of some public importance, I am induced to request your permission to state them briefly and correctly in your valuable journal.

The MSS. left by my brother are of two kinds. The first, to which he himself attached the chief importance, relate to his general work, and will, in all cases, be preserved. Arrangements have been already made for their publication. The second are the MS. indices prepared as the foundation for his *Sanskrit Lexicon*, which was in

progress when he died. According to the opinion of an authority in whom my brother reposed entire confidence, these indices are not so much bricks for an edifice as clay out of which bricks have to be made. They could only be used by persons possessing a similar knowledge of the language, and able to deal with them independently. To such an extent is this the case, that it would be impossible for any Sanskrit lexicographer who employed them, to distinguish in the complete work what was his own and what was Goldstücker's.

Now, my brother, fully aware that his own scientific method of treating the subject, to which he devoted his life, was irreconcilably opposed to that adopted by the majority of his co-workers, felt that the use of his indices, after his death, by persons using a thoroughly antagonistic method, would lead to deplorable results unless specially controlled. This feeling occasioned him unmixed regret, but became predominant, so that he was resolved at all hazards, even by personally burning his own MSS., to prevent such a misuse of his labours. This design formed the subject of many conversations between us, especially towards the close of 1869; and his disturbed state of mind at my not recognising his right to ensure the final and unconditional destruction of his MSS. convinced me that I had only the following alternative to consider: to give him the hope that I would fulfil his instructions, and thus probably prevent him from destroying his MSS. with his own hand; or to deprive him of this hope, and thus probably render their destruction certain. But I could not make up my mind to this alternative without a reservation. Acknowledging that my devotion to the interests of my brother's science must ever be less than his, and that no one could judge better than himself how those interests could be most advanced, I promised not to neglect his directions, provided none of them bore the marks of passionate precipitation. This promise continues binding.

When, therefore, I received the startlingly sudden news of his death, I came to England, fully convinced that no change had been made, and nerved to make a sacrifice which it had been the very object of my promise to prevent. I found a change—a partial, but not a complete remission. While my brother was still in health, he told a person, whose word I can thoroughly trust, that if the MSS. would fetch 500*l.* they need not be burned. I considered this large sum to be fixed in order to escape from any mercantile speculation. But this change of disposition justifies me in preserving the MSS. for the moment; indeed, as no time was fixed within which this price is to be obtained, the period is left to my own determination. If the money be obtained, it will be handed over to the person named in my written stipulations respecting my brother's literary remains in England, left in charge of Mr. Hepworth Dixon, who has had the kindness to act under my power-of-attorney. I have also thought proper to attach other conditions to the purchase, which will be communicated to any intending purchaser, having for their object the prevention of any such scientific misuse of these MSS. as my brother was anxious to prevent; but I lay no value upon them for their own sakes beyond their being the only ones which I could discover for the moment, to fulfil my conflicting duties with a clear conscience. To preserve the indices, without prejudice to the scientific interests which my brother wished to secure, will ever remain the sole rule for my conduct in this transaction.

Berlin, April 28, 1872.

WILHELM TOBIAS.

### Intelligence.

A letter from a missionary in China, lately published in the *Daily Globe* of Toronto, Canada, affords important testimony to the great linguistic value of Mr. Bell's "Visible Speech" alphabet. The writer states that his study of the language has been successful, and greatly aided by the new alphabet. It has given him a great advantage over those who are learning beside him, so that, although they have the advantage of having been in the country two or three months before him, he can read three characters to their one, and they cannot pronounce correctly. It appears that many who had devoted a long time to learning the language with the Roman alphabet were giving it up in despair. The writer undertakes in one month to supply a visible speech lesson-book, by which people at home could learn Chinese as easily—indeed more easily—than with a teacher. Visible speech has also been applied in America to teach articulation to deaf mutes, and has succeeded perfectly, even the intonations of the voice being imparted to the pupils. There seems every reason to believe that before long the system will be in universal use for this purpose throughout America.

Dr. G. Bühler, of Bombay, has issued the first part of a Catalogue of Sanskrit MSS. contained in the private libraries of Gujarât, Kâthiawâd, Kachchh, Sindh, and Khândesh. It is merely intended to be a survey

of the Brahminical libraries in that part of the presidency, and, as such, will be highly useful to Sanskrit scholars. New lists, Dr. Bühler says, are now being prepared, in which the first and last slokas are to be given. The original lists, from which this volume was compiled, include upwards of twelve thousand MSS. It contains the Vedic literature, under the heads of *Mantrasamhitâs* (182 MSS.); *Brâhmanas* (82 MSS.); *Upanishads* (620 MSS.); *Sâtras, Parîśiṣṭas, Kârîkas*, &c. (320 MSS.); the remaining *Vedâṅgas, Anukramanikâs*, &c. (90 MSS.); and an appendix containing 179 MSS. under the head of *Prayogas*. Dr. Bühler estimates the total of the Brahminical MSS. in the larger libraries of his division at upwards of 30,000. The *Jaina* books he takes to be much more numerous, and probably to amount to four or five times that number. As this branch of Hindu literature is yet very little known, he proposes to give first a list of the oldest works, the *Sâtras*, with a short analysis of each, and a general survey of the whole literature according to the Jaina authors. Dr. Bühler also expresses his readiness to procure copies of the MSS. contained in the catalogue—ordinary copies at the rate of Rs. 2½–3 per 1000 ślokas, and corrected ones at Rs. 4–5 per 1000—for any scholar who may apply to him.

A very interesting recent publication is Signor John Beludo's *History of the Greek Colony at Venice*: 'Ελλάδων ἀποικία ἐν Βενετίᾳ, ἱστορικὸν ὑπόμνημα Ἰωάννου Βελούδου. Ἐν Βενετίᾳ, τυπ. τοῦ Ἁγίου Γεωργίου, 1872. The author (well-known as the sub-librarian of the Marciana at Venice) has availed himself of numerous unpublished documents, and has thus succeeded in giving a faithful account of the history of the Greek colony at Venice, which was the centre of Greek intellectual life from the sixteenth century until the foundation of the Greek kingdom. The Greek college and the various Greek presses are treated of at considerable length. As the work is written in very pure Greek, we venture to recommend it both to lovers of Greek literature and friends of accurate historical investigation.

The first volume of Mr. Const. Sathas' *Μεσαιωνικὴ Βιβλιοθήκη* is now ready, forming a well-printed volume of 314 pages of text with 11*l.* (138) pages of introductory matter. Instead of three volumes, as we stated in a previous number of our journal (vol. iii. p. 20), the work is now intended to fill no less than six, owing to the addition of most important historical extracts from the *Diarii Storici* of Marino Sanuto which exist in MS. at Venice, and of two volumes of Byzantine Anecdota, including an inedited historical work of Michael Psellus, and historical speeches and letters by Nicetas Choniates. We shall recur to the work as soon as the second volume is published, in which the editor promises the mediaeval chronicles of Cyprus, and an account of inedited coins from the pen of Mr. Paulus Lambros, a gentleman justly celebrated for his accurate knowledge of mediaeval Greek antiquities.

Messrs. Teubner have just published the first volume of a biography of the well-known translator and poet John Heinrich Voss, from the pen of Professor W. Herbst. The style of the volume is very readable, the course of the relation not being interrupted by continual references and foot-notes, as is unfortunately the case in many German publications. To insure accuracy, there is at the end of the book an appendix entitled "Sources and References," with the usual fulness and elaboration of German philological research. Of great interest are the letters exchanged between Voss and Heyne; and friends of German literature will meet with much new material concerning the life and opinions of Klopstock and other literary characters of the second half of the eighteenth century. The present volume carries the life of Voss down to his removal from Otterndorf to Eutin, and thus leaves by far the most important part of Voss's life to the second volume, which we hope to see at not too long an interval after the appearance of the first.

The first number of Messrs. Teubner's *Mittheilungen* of this year, contains notices on the following publications: (1) *Homeri Ilias*, ad fidem librorum optimorum edidit J. La Roche; (2) a Manual of Greek and Latin metres, by W. Christ; (3) a new instalment of Bursian's *Geography of Greece*, containing the Islands; (4) a Manual of German antiquities and commentary on Tacitus' *Germania*, by the late Professor A. Holtzmann, edited by Holder; (5) a new edition of Ammianus Marcellinus, by Gardthausen, and a number of school-books.

The January number of the Greek journal *Παράορα* contains the first edition of the mediaeval Greek poem *περὶ τῆς ξενιτειᾶς*, found in the Vienna MS. The text is printed from a copy made by Mr. Sathas, but is still capable of emendation in more than one place. The poem is an artless, but by no means inelegant composition, in 548 lines, in which the fervent love of their native soil, always inherent to the Greek character, is well expressed by one who had himself tasted all the bitterness of exile. There are frequent traces of the employment of popular songs in this poem.

It gives us much pleasure to notice the second edition of the second part of the late Professor Conington's *Virgil* (containing the first half of the Aeneid). It speaks well for English students and scholars that so excellent and refined a work as this has so soon reached a second edition. We venture to recommend continental scholars to take more notice of the Professor's notes and introductions than they appear to do at present.

### Contents of the Journals.

**Journal of the Royal Asiatic Society**, new series, vol. v. pt. 2.—I. Specimen of a Translation of the *Ādi Granth* of the Sikhs; by Dr. E. Trumpp. [Twenty hymns, in the original ancient Gurmukhī, are here given, with an English translation and critical notes, of this holy book of the Sikhs, which Dr. Trumpp is now translating for the Indian government.]—II. Notes on Dhammapada, with special reference to the question of *Nirvāṇa*, by R. C. Childers. [A number of passages are here commented upon and translated differently from previous interpreters, in support of the writer's view, that *nirvāṇa* is a state of blissful freedom from human passion on earth, followed by annihilation after death.]—III. The *Bṛihat-Saṃhitā*; or, Complete System of Natural Astrology of Varāha-mihira. Translated from the Sanskrit into English by Dr. H. Kern. [Continuation; chapters 16–35.]—IV. On the Origin of the Buddhist *Arthakathās*; by L. Comrillā Vjasinha; with an introduction by R. C. Childers. [The Sinhalese scholar endeavours to prove that the commentary on Buddha's sermons mentioned by Buddhaghosa as having existed during Buddha's lifetime, and collected at the first council immediately after his death, were desultory discourses delivered by Buddha in explanation of the *piṭakas*.]—V. The Poetry of Mohamed Rabadan of Aragon; by Lord Stanley of Alderley. [Continuation. This portion of Rabadan's poem, in the Morisco-Spanish, relates the history of Shaibeh or Abdulmutalib, the son of Heshim, and of his son Abdullah, the father of the prophet.]—VI. *Proverbia Communia Syriaca*; by Capt. F. Burton. [A collection of 187 modern Arabic proverbs, text, translation, and notes.]—VII. Notes on an Ancient Indian Vase, with an account of the Engraving thereupon; by C. Horne. [The vase here described, and since acquired for the India Museum, was found in the Kūlū country, near the junction of the Chandra and Bhagur rivers. The writer believes it to be Buddhistic, and fixes its date at about 200 or 300 A.D.]—VIII. The Bhar Tribe; by the Rev. M. A. Sherring, of Benares. [This tribe, also known by the terms Rājibhar, Bharat, and Bharpata, once occupied the tract of country between Gorakhpur in N. India and Saugor in C. India. The paper is illustrated by seven plates of bearded Bhar figures.]—IX. Of Jihād in Mohammedan Law, and its Application to British India; by N. B. E. Baillie. [The writer endeavours to show that Jihād, or religious warfare, on the part of the Indian Mussulmans against the British government, is unlawful according to Mohammedan law.]—X. Comments on Recent Pehlvi Decipherments; with an Incidental Sketch of the Derivation of Aryan Alphabets; and Contributions to the Early History and Geography of Tabaristān; by E. Thomas. [The writer addresses some fresh material in support of his theory that the Pehlvi letter, read as *mu* by the Pārsis, and by Du Perron and De Sacy, is to be read as long *f*; and contrasts his method of Pehlvi interpretation by starting from the early alphabets preserved on medals, seals, &c. with that of other scholars who try the language of the inscriptions by the backward test of the Pārsi fragments still extant.]—Annual Report.

**The Indian Antiquary**, ed. by J. Burgess; part iii. (Bombay, March).—Sketches of Mathurā; by F. S. Growse. Description of the country near Mathurā, and historical account of that place.]—On the Identification of various Places in the Kingdom of Magadha visited by the Pilgrim Chi-Fah-Hian; by A. M. Broadley. [Continuation; of the Mount Baibhar.]—The Jungle Forts of Northern Orissa; by J. Beames. [Continuation.]—Biographical Notices of Grandees of the Mughul Court; by H. Blochmann. [The first of a series of biographical sketches of Amlirs of the reigns subsequent to Akbar, chiefly drawn from the *Madsir ul Umarā*, by Shah Nawāz Khān of Aurangābād. It begins with Shaikh Dāūd Quraishī, who served under Dārā and Aurangzib.]—The Indigenous Literature of Orissa; by J. Beames. [A list of (82) ancient Uriyā works known to be in existence.]—Translation of and Remarks on a Copper-plate Grant discovered at Tidgundi in the Kalādgi Zilla; by Shankar P. Pandit. [A Chālukya grant from the time of Tribhuvana Malla Deva (? A.D. 1083).]—Dardū Legends, Proverbs, and Fables; by G. W. Leitner.—Reviews. [Favourable; of Fergusson's *Rude-Stone Monuments*; and Broadley's *Ruins of the Nalanda Monasteries*.]—Miscellanea.—Part iv. (Bombay, April).—Tamil Popular Poetry; by R. C. Caldwell. [Three poems, in Tamil and English, by Sivavakkiyar and Puttiragiriya.]—On the Non-Aryan Element in Hindi Speech. [Upholds Lassen's theory, that almost all, if not all, Prakṛit words are derived from Sanskrit, against that of Muir, that in the modern vernaculars words not derived from Sanskrit are very numerous.]—On the Identification of Various Places in Magadha, &c.; by A. M. Broadley. [Continuation; on Mounts Vipula, Ratnagiri, and Udayagiri.]—On the *Chandikāṭaka* of Bānabhaṭṭa; by G. Bühler. [Account of that work, being a century of stanzas in honour of the goddess Chandī. The fact that a poem of that title had been composed by Bāṇa, the author of the *Kādambarī* and the *Harshacharitra*, was hitherto only known from a passage of a comment on the *Bhaktimāra-stotra*, quoted by Dr. F. Hall.]—Bengali Folk-lore: a Legend from Dinajpur; by G. H. Damant.—On the Rāmāyaṇa; by Prof. A. Weber.

[Translated from the German, as published in 1870.]—Correspondence, Notes, and Queries.—The Sṛīrangam Jewels.—The late Professor Goldstücker; by C. Mather.

**Calcutta Review**, January.—Notes on the Arabic Language. [Tries to show a radical connection between the Aryan and Semitic languages, by comparing Arabic with English words.]—The Architecture of Kashmir; by F. S. Growse. [A brief but useful account of the various temples of Kashmir, their probable date and history, style of architecture, &c.]—The Revision of the N. W. P. Settlements.—Elementary Education in Madras.—Benoudha. [The writer traces the history of that portion of Oudh, principally availing himself of the writings of P. Carnegy (viz. *A Historical Sketch of Fyzabad Tehsil, including the former Capitals of Ajudhiā and Fyzabad, 1870; Notes on the Races, Tribes, and Castes inhabiting the Province of Oudh, 1868; Fyzabad Settlement Reports—Historical*), though other works, such as Sleeman's *Tour*, and Butler's *Southern Oudh*, are also used.]—The Income-Tax in India.—Reminiscences of Ava; by J. T. Wheeler. [Recollections, personal and political, of Mr. R. S. Edwards, late Collector of Customs at Rangoon, who was born (in 1802) and educated at Madras, and was sent, in 1819, to the Straits Settlement to be a clerk in the office of the Superintendent of Wellesley. In 1825 he proceeded to Tenasserim, where he witnessed the outbreak at Tavoy, under Moung-dah, in 1829. In 1839 and following years he was the principal medium of communication between the English Residency and the Court of Ava.]—The Bengal Commissariat.—Topics of the Quarter (Land Revenue, and Education in Bengal).—Brief Notices of Vernacular and Anglo-Indian publications. [W. C. Bennett's *Report on the Family History of the Chief Clans of the Roy Bareilly District*; M. Müller's *Classical Studies in India*; J. Westland's *Report on the District of Jessore, its Antiquities, History, and Commerce*; W. Oldham's *Historical and Statistical Memoir of the Gazipur District*; C. E. Gover's *Folk-songs of Southern India*; J. Garrett's *Classical Dictionary of India, illustrative of the Mythology, Philosophy, Antiquities, Arts, Manners, Customs, &c. of the Hindus*; Prātāpa Chandra Ghosha's *Durgā Pīṭh*, &c.]

### New Publications.

- ASTON, W. G. A Grammar of the Japanese Written Language; with a Chrestomathy. London: Printed at the Office of the *Phoenix*.
- BECKHAUS. Xenophon der Jüngere u. Sokrates od. über die unechten Schriften Xenophons u. die Hellenika. Berlin: Calvary.
- DINTER, Bernh. Satura Grammatica (Stellen aus Cäsar, Sallust u. Horaz behandelnd). Grinma: Hering. (Teubner.)
- GOETSCHKE, C. Adnotationes Sophocleae. Agitur de Oed. Col. vv. 1044–1058. Berlin: Calvary.
- GRIMM, J. W. Deutsches Wörterbuch. Fortgesetzt v. R. Hildebrand u. K. Weigand. 4. Bd. 5. Lfg. Leipzig: Hirzel.
- HAUPT, M. Variarum Lectionum capita VII. Berlin: Calvary.
- HEITZ, E. Die öffentlichen Bibliotheken der Schweiz im J. 1868. (French and German.) Basel: Schweighäuser.
- HUBSCHMANN, H. Ein zoroastrisches Lied m. Rücksicht auf d. Tradition übers. u. erkl. München: Ackermann.
- NORRIS, C. Assyrian Dictionary. Vol. III. Williams and Norgate.
- OPPERT, J. Mélanges perses. Paris.
- PARIS, Gaston, et PANNIER, L. La Vie de saint Alexis, poème du XI<sup>ème</sup> siècle, et renouvellements des XII<sup>ème</sup>, XIII<sup>ème</sup>, et XIV<sup>ème</sup> siècles, publiés avec préface, variantes, notes et glossaires. 7<sup>ème</sup> fascicule de l'École des hautes études. Paris: Lib. Franck.
- PRAETORIUS, F. Beiträge zur Erklärung der Himjarischen Inschriften. Halle: B. des Waisenhauses.
- PÜSCHEL. Li romanz de la rose. Première partie. Par G. de Lorr's. Berlin: Calvary.
- RASMUS, E. De Plutarchi Libro, qui inscribitur di communibus notitiis commentatio. Berlin: Calvary.
- SCHNEIDER, P. De Elocutione Hesiodae commentatio. Pars I. Berlin: Calvary.
- SUSEMHL, F. De Politicis Aristoteleis quaestionum criticarum particula IV. Berlin: Calvary.
- VERGILIUS P. MARO's Georgica, hrsg. u. erkl. v. Dr. E. Gläser: mit einer Einleitung. Halle: B. des Waisenhauses.

### ERRATA IN No. 47.

- Page 164 (δ), line 40, for "Sturm und Drang" read "Sturm und Drang."  
 „ 164 (δ), 9 lines from bottom, for "Dutmar" read "Dülmen."  
 „ 167, line 4 of *Intelligence*, for "best" read "least."

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 49.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for. The next number will be published on Saturday, June 15, and Advertisements should be sent in by June 11.*

## General Literature.

**Sancti Brandani.** Ein lateinischer und drei deutsche Texte. Herausgegeben von Dr. Carl Schröder. Erlangen: Eduard Besold, 1871.  
**Bibliothek van Middelnederlandsche Letterkunde,** onder Redactie van Mr. H. E. Moltzer, Hoogleraar te Groningen. Sixth Part. Groningen: Wolters, 1871.

THE subject of the two publications before us is one of the most widely spread legends of the middle ages, and is also to be met with in two old English versions, one in verse and the other in prose, edited by Thomas Wright (*St. Brandan*, London, 1844, Percy Society). It is to be found in French and Spanish, was known in Italy, and formed everywhere the favourite reading both of monks and the widest secular circles. Even so late as in 1721 expeditions were undertaken in search of the island paradise reached by the saint in the course of his wanderings by sea and through hell and purgatory. According to the Spaniards, the island of "San Borondon" was the sojourn of King Roderick, who was overcome in battle by the Moors. According to the Portuguese, their king Sebastian was still living there, after having been in like manner vanquished by the Arabians in the battle of Alcasarquivir. It is probable, too, that the island of Avallon, where King Arthur, according to the English belief of the middle ages, was supposed to be still alive, was the same Brandan's isle, in so far, that is, as the legend rested on the ancient conception of an island lying in the western sea, which according to the heathen faith was the abiding place of the blessed, and to later Christian fancy contained the earthly paradise, where, for instance, Elijah and Enoch still live on. Even yet the belief is not quite extinct, as the Irish idea of the island *Hi Breasal* shows; and this is the same, I think, as that reached by the Irish monks in their miraculous voyage, in Geoffrey of Viterbo (p. 78, ff.; cf. *Acta SS.*, June 2, 184). Again it is related, in an Irish MS. of the seventh century or earlier, at the Royal Library of Stockholm, how an Irish chief once found on a tree near his castle a golden bough, covered with flowers of gold and precious stones. He broke it off and took it with him to the castle, and while every one was admiring it, a beautiful woman came forward and claimed the precious object, maintaining that it came from an island where such branches grew commonly, and where men never grew old. She advised the chief to fit out a vessel and to sail with her for that island, which he did in a ship manned by thrice nine sailors. They reached the island and stayed there some time, and were so happy that the days went by without their knowing how. At last their leader returned to Ireland, but no one knew him any more, for he had been away more than a hundred years. (See G. Stephens, *Förteckning öfver de förnämsta Brittiska och Fransyska Handskrifterne uti Kongl. Bibliotheket i Stockholm*, Stockholm, 1847, pp. 18, 19.)

A similar popular belief still exists in Norway concerning

the island *Udröst*, which people reach sometimes by chance, but never when they seek it. The legend is admirably related in Asbjörnson's *Norske Huldre-Eventyr og Folkesagn*, 3rd ed., Christiania, 1870, "Skarvene fra Udröst." But to return to St. Brandan; all the versions hitherto noticed, including the English ones, as Schröder maintains against Wright, are traceable to a Latin prose legend, which they all follow. In this Latin legend there are two elements which must be distinguished; namely, a national mythological foundation, and a universal Christian legendary superstructure resting on the first and giving it a special ecclesiastical colouring. On the other hand, there were, in the thirteenth century, many other forms of the legend, which depart materially from the Latin text, by additions and amplifications, besides abandoning much of the specifically monastic spirit and arrangement which characterize even its fictions. In exchange they introduce something of the new spirit which took possession of Europe during the Crusades; something of the delight in huge deeds of arms, in extravagant wonders and miracles, in strange, new, exciting tales, of which Gervinus speaks. The Old-German texts here published by Schröder represent the latest form of the legend, and contain half ascetic, half heroic sea voyages, in common with other contemporary poems, such as *Oswald und Orendel*; while from another, *Herzog Ernst*, it borrows various wonders which take the place of details from the earlier Latin outline, which it omits, or more or less considerably modifies. The contrast between the two versions appears from the first, as Schröder observes. In the Latin text Brandan is induced by the narration of Barinthus, who had been privileged to see the *Terra repromissionis sanctorum*, to set forth in search of the fortunate island; after seven years' wandering, he finds it, and then returns home. In the German version, on the other hand, Brandan is introduced as suddenly seized with doubts as to the marvels related in a book he is reading, and, cursing the poet, he burns the book. As a punishment for this he is condemned to wander over seas for nine years, to see with his own eyes the things which he had refused to believe, and to write down the account of them for an everlasting remembrance. He is not pardoned and allowed to return till the book of his adventures is finished, and the loss of the work he had rashly burnt in some sort made good.

Of the three German texts, two are in rhyme, and of these the first, in Middle High German (in 1934 verses), which has not been printed before, belongs probably to the end of the twelfth century. The second is an abridged, or rather a mutilated, Low German translation of the other, in 1165 verses, of uncertain date, published once before, but very defectively. The last is a prose paraphrase of the first poem, dating from the fifteenth century, which had been printed as a chap-book no fewer than thirteen times before 1521. Besides these Schröder also gives the Latin legend, to enable the reader to estimate the relation between it and the German version, as Jubinal's edition (Paris, 1836) was badly printed, in only a small number of copies, and from a bad MS. In addition to its critical merits, Schröder's work is recommended by an instructive introduction and remarks, only however intended for the learned, on points of language and matter. From these I will only quote two passages, which show that even in the middle ages doubts had emerged respecting the authenticity of St. Brandan's travels, since Vincentius Bellovacensis, in his *Speculum Historiale*, observes, "Hujus autem peregrinationis historiam propter apocryfa quedam deliramenta que in ea videntur contineri, ab opere isto resecavi." The other passage occurs in a satirical poem, describing the drunken monks of the Scottish convent at Erfurt, but it also shows in what high regard Brandan was held, at least by the Scotch:—

"Sunt et ibi Scoti, qui cum fuerint bene poti  
Sanctum Brandanum proclamant esse decanum  
In grege sanctorum, vel quod deus ipse deorum  
Brandani frater sit et ejus Brigida mater.  
Sed vulgus miserum non credens hoc esse verum  
Estimat insanos Scotos simul atque profanos  
Talia dicentes. Accedant scire volentes,  
Ex evangelico textu proba quod tibi dico:  
Qui non delinquit, sed qui perfecit, inquit,  
Velle mei patris, illum voco nomine fratris.  
Immo meus frater est et soror et mea mater.  
Sic sancti quique, qui regnant hic et ubique,  
Et possunt fratres simul et Christi fore matres,  
Si non ignores, et possunt esse sorores.  
Sic Brigidam matrem, Brandanum dicite patrem,  
Nam perfecerunt, quecunque deo placuerunt."

Besides the texts published by Schröder, and belonging to the group which departs from the Latin form, is a Middle Dutch version, published formerly by van Blommaert, and now reprinted by Professor Moltzer as part of the above-mentioned *Bibliothek*, of which the object is to familiarise the general public with the ancient literature of the Netherlands. Its productions appear in this collection under the learned direction of the professor, and with the co-operation of other distinguished proficient in that literature, such as Professors Bisschopp, Brill, Hermans, Jonckbloet, Verwijls, and de Vries. As in the *Deutschen Classikern des Mittelalters* (which I shall notice in the *Academy* shortly), the texts are provided with ample notes for the instruction of the general public, but the introductions contain nothing but what is rigorously indispensable. Opinions vary as to the original source of *Sinte Brandaen*; the learned editor regards in this light some possible French version, and assigns the Dutch poem to the thirteenth century, while Jonckbloet and Schröder believe it to have been translated from the Middle High German in the twelfth century—a view which Professor Moltzer will probably share after the appearance of the Middle High German poem. It is true that the Dutch text is fuller than the German (it contains 2284 verses), but it contains nothing peculiar to itself, though in one place it serves to supply a seeming gap in the German text, and it also contains an interpolation (v. 137–260) which is entirely wanting in all German copies. I will only allow myself a few remarks on the notes, in which almost every serious difficulty is satisfactorily met. On v. 184–194, where Brandan sometimes addresses the death's head as "thou," sometimes as "you," the editor observes, "This is a piece of carelessness either of the copyist or the author." But it is not so, for the change from the singular to the plural in addressing the same person is met with elsewhere, not only in Flemish, but also in German, English, Danish, Icelandic, French, Provençal, Italian, and Portuguese, especially in the older poems, as I pointed out in the *Gött. gel. Anz.*, 1866, p. 1038; 1870, p. 1232; and 1872, p. 318. Accordingly in the poem before us, *di*, v. 1248; *ghi*, v. 1254; *saechdine*, v. 1894; and *suldijs*, v. 1913, are right, and should not be altered. On v. 314, *om hout dat si ghingen*, it is observed that *dat* is superfluous; the same may be said of many other passages, e.g. v. 322, 1522, 1524, &c.; cf. Borman's *Leven van Sinte Christina de Wonderbare*, Gent, 1850, pp. 149, 279. V. 615, *daer verbeide ic dat ghesille: wille*, does not make good sense, as the learned editor rightly remarks. The corresponding line in the Middle High German poem (v. 419) runs, *biz daz weter wirt stille: wille*; which shows that the reading of the other manuscript, *daer verbeide ic dat ghestille*, is right—*ghestille* being here not a substantive but an intransitive verb, so that *dat ghestille* will mean the same as *dat het wordt stille*. V. 907, *Waric niet een droghenare*, is not quite right according to Professor Moltzer, as, if *niet* were correct, the negative *en* should precede it, besides which Brandan would not declare

himself a deceiver. But *en* as a double negative is common in Middle High German, and there are other traces, as the editor himself notices, of Germanism in the Dutch poem; while for Brandan to call himself a deceiver is only a consequence of his extreme humility. The corresponding passage in the German poem runs quite differently. V. 1155–6, *Die storem wart arde groot—Die see borlede ende scoot*: this is not sense, says Professor Moltzer, and wishes to read *woet* instead of *scoot*. Yet *scoot* may be here the imperfect of *scieten* (*schieten*), in an intransitive sense, as in Old and New German *schiezen*, *schiessen*, may mean, "to move as fast as a shot": the German poem has (l. 825–6), *ein wester wint hltb sich vil gröz—von dem daz mer sere irdoz*.

These remarks, scanty as they are, will serve to show that I have read the Dutch poem carefully through, and can therefore confidently recommend the whole collection to which it belongs to those who wish to acquaint themselves with the Old Dutch literature without difficulty or fatigue.

FELIX LIEBRECHT.

The Life and Letters of St. Francis Xavier. By Henry James Coleridge, of the Society of Jesus. Volume the First. Burns and Oates.

FRANCIS XAVIER is one of the very few saints canonised since the sixteenth century whom the world has agreed to recognise: it is superfluous to seek very far for the reason of the recognition. His self-devotion was too astounding not to be conspicuous, and, like St. Vincent de Paul, he was devoted to a cause which it was, to say the least, respectable to patronise. We have gone on admiring him with so little knowledge that really Mr. Venn might almost find some excuse in our ignorance for treating his reputation as a bubble that would burst when touched. Of course, in one sense the main facts of Xavier's life are known, but this is only another reason for gratitude to a writer with the qualifications of Father Coleridge, who makes it his "chief object to draw out the character of St. Francis Xavier from his own words and actions." Perhaps in one way he is almost too well qualified: more than once he seems to write like a man who is filling up an outline which is present to his own mind, while it has hardly been impressed on ours. Still the story is given more completely and more coherently than it has been given in English at any rate before, and the process of fitting the letters into biographies which were not written from them has been got over in spite of difficulties which would be worth referring to in future editions of the *Horae Paulinae*. These difficulties, though real enough, are not so obtrusive as to affect any but the attentive student: the ordinary reader will take more interest in the tact which elucidates comparatively isolated points. For instance, the aid which Xavier received from Loyola becomes intelligible when we are reminded that a young noble from Navarre, who wished to be respected in Paris as he had been respected at home, would soon find the sums which friends in Navarre might think it sufficient to send very insufficient for wants which he might easily think legitimate. Whether we admire Xavier's sacrifice in passing his home without a farewell, or are content to respect what is outside our sympathies, it is a relief to know that he could not have been expected, and that therefore the sharpest pain at any rate fell upon himself alone. Nor has any writer before given so much prominence to a fact which explains and justifies the wholesale baptisms in which Catholic writers have been too prone to find matter for boasting, as Protestant writers have been too prone to seek matter for apology. Neither is in place when we remember that Xavier was always specially drawn to neglected populations of native

Christians whose religion was little more than a name to which they were sincerely attached.

It is always difficult to describe the character of the saints—their habitual thoughts are so far from ours; and since the world has become self-conscious, their self-suppression has become more deliberately impenetrable. We certainly know even less of Xavier and of Loyola than of Francis of Assisi and of Bernard of Clairvaux. Almost all that outsiders can hope to ascertain about a man like Xavier is the point at which he started and the direction in which he moved, to become the unknown being that he was. We are struck at once by a singular union of sweet radiant impetuosity, like what we might imagine for the saintliness of a Shelley, with the most patient common sense and the most generous candour.

From first to last his sense of the obligations of his religion was so keen and eager that he was always pressing them upon others to the verge of exactingness, and yet he is always spontaneously exuberant in his thankfulness for even the cheapest and easiest approximations to his standard. Another contrast suggests itself, and will hardly be repelled, Xavier's power of organization was on the same heroic level as his devotion to personal labours; but anything like sustained opposition invariably drove him to break up new ground. The charm of his charity and gracefulness was immense; there were not many who were obstinate enough to resist it when it was brought to bear upon them, and the multitudes who passed under his ascendancy received a deep and powerful impulse towards good. But a person who could hold out against Xavier for six months could baffle him for ever; and in this way the very magnitude of his success became the source of his severest disappointments. In a few months he could achieve results which another man would have hardly dared to anticipate from the labours of a life, and then he had to watch the steady persistent working of hostile forces in a struggle which seemed hopeless because he was helpless. His work was in reality for the most part exceedingly solid; but its immense and interrupted promise was always tormenting him with the impression that it was illusory. And whatever they may have been for India and for the world, we can hardly doubt that the immense diplomatic and ecclesiastical powers which he received from the king of Portugal and the pope were a heavy misfortune to himself. After his first year in India the duties in which they involved him compelled him to withdraw more and more from preaching and baptizing from village to village—the only work in which he could really find consolation for his immense privations. Sometimes the consolation, like the suffering, was almost too much for flesh and blood—the joy in the good of which he was the instrument was too intense for earth; sometimes he longed for martyrdom to release him from a world where he felt useless; once, at least, he felt the saying—"He that will save his life shall lose it, and he that will lose his life for my sake shall find it"—hard and obscure. Perhaps the last mood is really the highest. We seem, taking the three together, to catch an echo within the limits of humanity of "I beheld Satan as lightning fall from heaven"—"I have a baptism to be baptized with, and how am I straitened till it be accomplished?"—"Now is my soul exceeding sorrowful even unto death, and what shall I say?"

Father Coleridge keeps the miracles with which the life of Xavier abounds as much in the background as is possible for a writer who delights in them and believes in them. It is, perhaps, a wise discretion; in a sense, it is keeping them in their natural place, in the place they had in the saint's own mind. If any man had the gift of miracles, it seems that Xavier had it, but he hardly thought of it; virtue went

out of him almost without his knowing. It is almost like an impertinence to pretend to know more about it than he knew himself. We may leave the question of his miracles altogether and hardly know less of him. And though he lived in the full daylight of history, and though his miracles are attested by sworn eye-witnesses, they throw less light on the general question of the miraculous than the wonders attributed to St. Martin, who could be pained by the sense of diminished power, or those attributed to the Curé d'Ars, who had the opportunity of cultivating the spirit of Christian sobriety to a very high degree within the whole of his immediate circle. We have no security that the sworn eye-witnesses could be trusted without cross-examination, or that they were cross-examined, or even that they were not asked leading questions by men who had been directed to them as in a position to verify the wonderful rumours that were in the air. Whenever we hear of raising the dead, it is natural to think of suspended animation, especially in India, where a Faquir submitted with impunity under tests devised by Europeans to be buried alive for a whole month. In a country where our own officers have been spontaneously deified, and might, if they had pleased, have exercised the gift of healing as freely as Charles II. or Vespasian, it is not wonderful that many should have believed they were benefited by the supernatural powers that it was so easy for them to attribute to a man who led the life of Xavier. Nor is the evidence of the Portuguese of a kind to dispel these uncertainties. They were hardly on the intellectual level of the Pilgrim Fathers, and the example of the Pilgrim Fathers proves that a sudden change of conditions enormously exalts the susceptibility to supernatural beliefs, and proves it so clearly that no one has thought it worth while to enquire whether it may not revive a susceptibility to supernatural influences. With this drawback the stories of Xavier's predictions stand on the same level as the most puzzling stories of clairvoyance, though, if the facts were established, it would be natural and legitimate to refer them to Grace in him and to nature in somnambulists. And this reflection applies to another class of wonders, for which even the evidence of Xavier's converts might be received, unless indeed it shall be established *à priori* that all wonders are impossible. It is well known that in certain conditions of nervous exaltation persons have been known to make coherent use of languages in which, in their normal state, they could not frame a single sentence. Such exaltation would be supernatural if it were produced by spiritual causes. Again, it is not hard for persons with great excitement to translate any sound into articulate words. There seem to be instances of a powerful personality impressing its own thoughts immediately upon others; this power, too, might be supernatural in respect of its source. Under such exaltation Xavier might preach in a language he had not learnt; by possessing such a power over thought, he might be heard to preach in several languages at once. However, without affirming that he had the gift of tongues, or denying that he raised the dead, we may say that his miracles, if he wrought any, serve rather for edification than for controversy. Indeed, until the processes of his canonisation are accessible, controversy about them is beating the air.

The volume is the first of a quarterly series of a sufficiently miscellaneous character which is to be conducted by the editors of *The Month*. Among its minor attractions we may mention the Spanish sonnet, attributed to Loyola, which is the original of the beautiful Latin lines which have become familiar as Xavier's. Father Coleridge appends another very inferior Latin version, and the half forgotten couplets of Dryden as the standard English rendering.

G. A. SIMON

## LITERARY NOTES.

The first number of a magazine entitled *Atsume gusa*, and intended, in the words of the editor, M. Turrettini, "pour servir à la connaissance de l'extrême Orient," has reached us from Geneva. In the preface we are told that its pages are to be more especially devoted to popularising in Europe the literature of China and Japan, and as a first step towards carrying out this object, M. Turrettini gives us in the number before us a translation from his own pen of the first chapter of the well-known Japanese romance *Heike monogatari*. The choice thus made is a good one, as not only is the *Heike monogatari* one of the most popular tales in Japan, but to European readers it presents a vivid picture of the state of Japanese society and government during the twelfth century. Literally translated, the title reads, "The History of the House of Hei." This is fairly descriptive of the contents of the work, which consists of an account of the struggles of the two great families of Gen and Hei for the supreme power, which, though nominally wielded by the Mikado, rested in reality in the hands of the Daimios. After the manner of feudal lords in all parts of the world, these nobles, each supported by his army of retainers, made war the one against the other, concluded peace, and usurped titles with barely so much as a reference to the official "fountain of all honour." M. Turrettini has, in some instances, missed the sense of the original, but, speaking generally, the translation is highly creditable to his knowledge of the language. We hope that he intends at some future period to complete the translation of the entire work.

In the *Revue des deux Mondes* (May 15), M. Louis Leger translates (with some abridgment) a story of village-life in Bohemia, by Mme. Svieta, whom her admirers and countrymen call the national George Sand, though in the specimen given the influence of Auerbach is at least as clearly visible.—M. Henri Delaborde invites the admirers of severe and conscientious art to visit the paintings of M. Édouard Bertin (the late owner of the *Journal des Débats*), at the École des Beaux-Arts, where the generation which has grown up since he ceased to exhibit in 1854 will have the opportunity of appreciating his talent.

In the *Preussische Jahrbücher* for May, the son of Immanuel Bekker publishes some notes and reminiscences of the youth and early manhood of the eminent philologist. He was noted for a shy awkwardness and reserve in later life; but it is curious to find that, even in his own special field, an overscrupulous diffidence considerably delayed the appearance of his first works of independent research. The letters to and from Wolf printed in the article are of more personal than scientific interest.

The *Magdeburg Gazette* states that a new and complete edition of Herder's works has been undertaken by the Halle Orphan-house, under the patronage of the Prussian government. None of the German classics is so much in want of revision as the works of Herder, and none, as the *Gazette* remarks, would gain more in interest by a restoration of the original text.

In *Im Neuen Reich* (May 17) F. Gehring deplores the indifference of German musicians to the study of acoustics, and their neglect of Helmholtz's theory of musical sound.—The editor begins a series of papers based on the chronicles (printed fifteen years ago) of the Franciscan monk Salimbene, a lively and intelligent writer of the thirteenth century, who only believed in very well authenticated miracles, and tried to decipher "*cum cristallo*," an illegible inscription on S. Mary Magdalen's tomb (at Saint Maximin, near Toulon), before being convinced that it was too illegible not to be genuine.—A new literary annual, *Die Diaskuren*, is well spoken of; nearly all the popular *littérateurs* of Austria contribute to its pages.

We have just received a newspaper report of part of Professor Max Müller's opening lecture at Strassburg. The largest auditorium in the Schloss was filled to overflowing: and the professor as patriotic as German professors are just now, and a great deal more eloquent. He dwelt upon the importance of maintaining the old German simplicity of life in the face of the demoralising influences of money-making and luxury.

## Art and Archaeology.

## SUMMER EXHIBITION OF THE SOCIETY OF FRENCH ARTISTS.

THE French school is passing at this moment through a critical phase, and this fact cannot but give rise to deep anxiety in the minds of all those to whom the interests of art are matter for serious concern. For standing, as this school does at the present moment, foremost in the world, whatever gravely affects its course must gravely affect the future of all. The signs of the time are evident; even this small exhibition affords ample food for illustration and comment. With little impertinence and much show of justice, one might boldly divide the contributors into two classes, viz. painters and scene painters. We have here the works of poets to whom colour, form, and line are the natural means of expression; we have here the work of those who give us the results of patient and profound study of the facts of nature; but we have here the work of those who, with well-calculated rough and ready handling, forcibly accentuate for us only our most obvious physical impressions. These men, the scene painters, are the young school. They have broken with tradition, and their work has that air of isolated effort which characterizes our century. They do much; better than it has ever been done before; they match tints with wonderful justness, but their colour is without refinement; they draw with daring certainty, but without delicacy; their composition is skilful, but without dignity; their technic is admirable for dash and command, but it is coarse. Whether such work is lovely and desirable in our eyes as art is not the question; setting aside personal predilections, the critic must endeavour to bring a trained and discriminating judgment to the appreciation of whatever matter presents itself. We cannot demand from Manet and Courbet expressive finish which is not in their intention, possibly not in their gift—what we have to estimate is the value of this terrible effectiveness which is an undoubted power in their hands. Small canvasses in a small room such as this do not indeed give us the opportunity of seeing such work on its favourable side. Its special excellences do not seem appropriate to the space and place, but they cannot therefore be ignored; they challenge us too boldly, they are too intelligible for that. What is likely to be the effect on taste of the production in art of work which corresponds in style to the style of the sensation writers in literature? It is evident that we are to be completely freed from the yoke of the Past, and thoroughly emancipated from tradition. Do we not run the risk of opening the door to all kinds of deceptive innovations, of substituting clever tricks for sound method, and of replacing the effort to instruct and train the eye by the mere desire of astonishing it? The true secrets of nature and art are only revealed to the patient, and those who cannot wait give us in all they do only the outside. One cannot but fear that this terrible effectiveness, so easy to understand, or, say rather, so impossible to misunderstand, which puts so forcibly to the eye the commonest, the most vulgar, the most salient facts, has from its very intelligibility a much to be dreaded seduction, and that it will to a great extent destroy any relish which may exist in the public for work of more subtle quality, which is less readily to be comprehended.

What can we have cleverer in its way, more vivid in presentment, than the green sea, the black ship, the dirty trail in the wake of the passing steamer, the frisk of the fish's tail, in Manet's "Dolphins"? Just the facts which the most untrained eye may take in in a couple of seconds. It is as clever and as forcible as Millais. Or, again, the brilliant trick of his "Bull-fight," or the bravado of his "Guitarplayer," or even the abominable ugliness of his "Christ in the Sepulchre." But this fresh slapdash destroys the eye for other work. Courbet's "Source of the Loue" is grandly conceived, and the relation of the slow entering gradations most skilfully managed; but it is difficult to turn from this, true as it is in a certain sense, and give full weight to the exquisite delicacy of tone and colour in Latarge's "Snowy Day," or the dreamy and somewhat monotonous refinements of Corot, of whose work "River Pasture" is a very fine example. "For this, for everything, we are out of tune; it moves us not." It requires even a certain effort before we can thoroughly enjoy the tolerably obvious artistic merit of Laurent Bonnier's "Spring," which is about the first picture which meets the eye

on entering. M. Bouvier has established a reputation by his decorative work, which he now sustains by the admirable drawing of the painting in question. As we might expect, "Spring" is treated decoratively. The figure rests in the branches of a blooming apple-tree, which forms the background, by an open network of branches interlacing over a sheet of tremulous blue sky. For a moment the motive reminds us of Hamon, but M. Bouvier has brought to the rendering greater force and positiveness, if less grace and sentiment than distinguishes Hamon's work. But of this force and positiveness comes a realistic treatment which, excellent in itself, yet hardly seems to accord with the ideal character of the motive. The head and expression have an ordinary character—they are those of the model unmodified, and the straightforward empty gaze disturbs the complete harmony of the impression. Yet "Spring" is a beautiful drawing, showing sound artistic feeling and much science. Close in its neighbourhood hang two of the four pictures contributed by J. F. Millet. The "Geese-driver" and (in respect of colour) even more beautiful "Shepherdess" are two poems from peasant life, in which subject and treatment are happily allied. The "Water Carrier" (a large work) afflicts us with the strange discrepancy between the sentimental grace and attraction of its tone and touch and the hideousness of the brutalised savage by these means placed before us. But everything which Millet does affords matter for study, for interest, for admiration. In "The Angelus," the most important both in size and subject of his four contributions, we find this delightful painter equal to himself, in colour, in sentiment, and in instinct for true finish and completeness. The suggestive exaltation of the woman's attitude makes her figure a poem in itself, of which the full charm and loveliness can only be realised by long looking. The lines of composition in Hemy's "Mending Nets" are noteworthy for their excellence. The figures are very insufficient. Amongst the landscapes, Rousseau's "Village on the Cliffs" is remarkable. The execution is wonderfully masterly, and the general effect has a noble truth of tone and feeling; every line and touch looks thoroughly felt. In "The Marsh," by Lansger, one recognises the sympathetic quality which the French prize in this young artist. Then Boudier's "Study at Fontainebleau" is very true and careful, and the rich colour of M. Dupré's "Pond" is attractive. A genuine sense of colour, too, is betrayed in Puvis de Chavanne's "White Rocks," but its power is marred by much wilful affectation—affectation, too, which loses all grace, and becomes pure offence in such treatment of such a subject as we find in the "Decapitation of St. John." The fresh naturalness of Fantin's flowers ought not to be left without remark; they are almost rivals of the flowers of that prince of flower painters, Albrecht Dürer.

The sketch for the "Assassination of the Bishop of Liege," by Delacroix, recalls us to other days, days when the conflicting tendencies of the French school were resumed by the names of Ingres and Delacroix. Now all is changed. No man is carried to a supreme height by the collective effort of many. Modern society is developing the individual at the expense of the family, and in every field of human labour this is making itself felt. The school with its influence and its responsibility is at an end; and the risk of endeavour and the crime of failure must be borne by each artist at his own peril. E. F. S. PATTISON.

#### ART NOTES.

A very noteworthy exhibition of old masters is now open at Amsterdam. MM. Six, van Loon, Pallandt, van Weede, van Dyckveld, have each lent a portion of their valuable collections. The catalogue enumerates nearly 350 chef-d'œuvres.

M. Jules Jacquemart has just finished a very fine medallion of Théophile Gautier, which will appear in the reprint of the volume *Émaux et Camées*, which is about to be published by Hachette.

There has been much talk in Paris as to the reported resignation of M. Lefuel, the architect attached to the Tuileries and Louvre. It was said that M. Lefuel, annoyed at having a young architect, M. Paschal, put upon him in the capacity of inspector, had sent in his resignation. It now appears that M. Paschal was added as assistant at the express request of M. Lefuel.

The "Sampson" of Michel Angelo is about to be removed from its place at one side of the entrance of the Palazzo Vecchio at Florence. It is found to be so seriously injured by the action of the weather that it is absolutely necessary to put it under cover.

M. Adolphe Moreau, the biographer of Decamps, is about to publish a work on *Eugène Delacroix et son Œuvre*.

Under the title, *Un Palais grec en Macédoine*, M. Léon Heuzey has just brought out the interesting work which last year he laid before the Academy of Inscriptions. The subject is an important edifice discovered by M. Heuzey at Palatitza, the ground-plan of which he has been able, with the help of M. Daumet, the architect, to re-establish. Starting from this point, the learned archaeologist seeks to prove, by a number of ingenious arguments, that the building in question was a prytaneum, serving probably at the same time as a palace for the kings of Macedon. The text is accompanied by an explanatory plan.

M. Brianchon, a well-known archaeologist, has just presented to the Musée de Sèvres some very interesting examples of ceramic. These are bricks of the Renaissance period which once decorated a house in the hamlet of Mare-Barbet (arrondissement of Havre). These bricks, representing masks, leafage, grotesques, fleurs-de-lis, medallions of men and women, inserted between the timbers of the façade of the building, are one of the rare specimens of pottery applied to the decorations of constructions in the sixteenth century. As has often happened on various occasions in ceramic, a potter seems to have cast the moulds for these bricks on some article of sculptured wood of the same date.

M. Jeanron, formerly director of the national museums of France and inspector of fine arts, has been named keeper of the archives of the School of Drawing and Mathematics.

The *Opinione* publishes a letter of Giustiniano Nicolucci, on the discovery in the Terra di Lavoro of a tomb dating from the Stone age. The letter goes into details: the writer says that the stone weapons found in this sepulchre are remarkable in point of workmanship, and denote talent and skill of the part of the workman who fashioned them.

M. Foucard, of Valenciennes, has recently presented to the Louvre a portrait of a man by Mabuse, signed, and dated 1524. It is in an excellent state of preservation.

The sale of twenty-five paintings from the collection of Mdme. Roëll, née Hodshon, at Amsterdam last month realised 50,000 fr. "Pigs," by Potter, was sold to M. Oppenheim, 705*l.*; "A Landscape," by Hobbema, to M. Newenhuys, 4,125*l.*; "A Marine," Vandervelde, to Mr. Holloway, 3,712*l.* The Antwerp Museum bought a "Waterfall," by Ruysdael, for 2,275*l.*—On the 13th, six water-colour drawings, by T. M. Richardson, were sold by Christie and Manson for 838*l.*; and on the 16th, a magnificent collection of engravings after Sir Joshua Reynolds was also disposed of. Amongst the most remarkable were, "Mrs. Carnac," by Smith, 87 guineas; "Lady C. P. Clinton," by the same, 30 guineas; "Miss Horneck Doughty," by the same, 36 guineas; "Nelly O'Brian," by Dixon, 40 guineas; "Lady Spencer Dickinson," 46 guineas; the "Strawberry Girl," by Watson, 68 guineas; the "Marchioness of Tavistock," by Fisher, 51 guineas. A collection of Watteau's works was sold at the same time for 310 guineas. There were about 700 plates, making up 5 vols.—On May the 13th and 14th, a portion of the Allègre collection came to the hammer at the Hôtel Drouot. It is impossible for us to mention all the important articles of this most important sale, but here are a few:—Two plaques of gold, enamelled on both sides, one representing Charlemagne and St. Louis, the other Pierre II. de Bourbon sire de Beaujeu, and Anne de France, his wife, daughter of Louis XI. The workmanship is French, and dates from the fifteenth century. They formed part of the Debruge collection, and are cited by M. de Laborde in his *Notice sur*

*les Émaux du Louvre*, p. 115. Bought by the Duke d'Aumale; 20,000 fr. Dessert spoon, knife, and fork, in gold, jasper handles covered with openwork ornament; belonged to Cardinal Mazarin; 10,300 fr. Two Chinese vases, in gold, chiselled in relief, set with pearls and other precious stones, from the Summer Palace; 25,200 fr. Bowl of rock-crystal, ornamented with three masks and arabesques of the most exquisite workmanship. It is of the very first period of the sixteenth century; was formerly in the collections of Louis and Édouard Fould. 18,900 fr.—The pictures, studies, curiosities, tapestries, &c. of Troyon's atelier will be sold shortly.—At the sale of Prince Napoleon, the portrait of Cosmo de' Medici, by Angiolo Bronzino, went for 325 guineas; a portrait by Vincenzo Foppa, 250 guineas; "A Girl at her Toilet," by Paris Bordone (from collection of Duke Litta of Milan), 700 guineas; "Portrait of a Youth," by Francesco Francia, 390 guineas; "Virgin and Child," signed Joannes Bellinus, 600 guineas. Two sixteenth-century statues—Bacchus and Venus—from collection of Duke Litta, 2,770*l.* A statue of Aeolus and a companion figure, from a fountain in the palace of the same nobleman, 1,260*l.* There were also a few fine pieces of majolica, one a bowl with the subject of Curtius leaping into the gulf in the Forum, attributed to Orazio Fontana, was sold for 125*l.* Two lustre dishes, one inscribed Fra Xanto, de Rovigo Urbino, 1532, the other, Fra X. R. 1536, went for 144*l.*

Mr. Cole sends us the following:—

"With a view to preserve accurate copies of the Cartoons of Raphael, the Lords of the Committee of Council on Education, acting through a committee, propose to select nine artists to make preliminary studies of given parts of three of the cartoons. Artists will first be required to complete an accurate copy either in water colours, tempera, or oil, of a photograph full size, of a head selected from the Beautiful Gate. These will be sent in to the secretary of the Science and Art Department by the 31st July 1872. From the candidates so competing, nine may be selected to make accurate coloured copies from the cartoons themselves of portions set out by the committee as a final test. Candidates will be allowed 2*l.* per week for not more than eight weeks to complete these copies, which will be the property of the Science and Art Department. If the competition prove satisfactory, a further selection of portions of the cartoons will be made to continue the work of reproduction."

### Theology.

**The Epistle of Barnabas.** [Erklärung des Barnabasbriefes. Ein Anhang zu de Wette's *Exegetischem Handbuch zum Neuen Testament*. Von J. G. Müller.] Leipzig, 1869.

THE title of this work is perhaps liable to some misconception. We might have inferred from it that the editor is disposed to assign to this Epistle a quasi-canonical position, such as that which it holds in Hilgenfeld's *Novum Testamentum extra Canonem receptum*: but in his introduction he is careful to explain that, by calling his work an appendix to de Wette's *Handbook to the New Testament*, he does not mean so much as this, pointing out that it differs in internal character from the Canonical Epistles, and that the instinct of the ancient church placed it on a lower level. He might have added to his other arguments the fact that the very witnesses commonly adduced to support its claims to canonical rank are adverse to these loftier pretensions. The *Codex Sinaiticus*, for instance, places it after the Apocalypse, and not with the Catholic Epistles, which would have been its proper position if regarded as a substantive part of the Canon: while Clement of Alexandria, who quotes it frequently and with respect, and even ascribes it to the "Apostle Barnabas," yet nevertheless on one occasion points out an error of fact into which the writer has fallen (*Pædag.* ii. 10).

In this work Müller has supplied a real want. Though the writings of the apostolic and subapostolic ages have been so carefully sifted of late, and reviews, monographs, and critical histories teem with materials ready to hand, yet no attempt had before been made to furnish a complete commentary on this remarkable work of early Christian antiquity. The edition of Cotelier, though now nearly two centuries old, still supplied the best and fullest body of notes. This defect is now remedied. Müller's *Commentary* is complete in all directions; no sources of information are overlooked; no points of interest left untouched. It is quite the most useful storehouse of information in all that relates to this epistle.

On the whole the grammatical portion of the *Commentary* is the least successful. It is difficult to see, for instance, why time should be spent on explaining common grammatical constructions like δι' ἡμᾶς (p. 183) and ποιεῖν τινά τι (p. 192), while the very unusual order in c. 1, τῆς δωρεᾶς πνευματικῆς, passes without a word of remark (pp. 56, 122), as if the editor were unaware that the position of the epithet is anomalous. Again, in c. 1, ὑπὲρ τι καὶ καθ' ὑπερβολὴν ὑπερενφραίνομαι, where he rightly defends the text against Hilgenfeld, he does not see that ὑπὲρ is used adverbially, as in 2 Cor. xi. 23, but renders ὑπὲρ τι "above anything," i.e. "above everything"—a sense which it could not possibly have in this connection. This want of grammatical insight again is seen in his treatment of a passage in c. 7, τὸν μὲν ἕνα ἐπὶ τῷ θυσιαστήριον, τὸν δὲ ἕνα ἐπικατάρατον καὶ ὅτι τὸν ἐπικατάρατον ἐστεφανωμένον; where he rejects the obvious explanation (to which the context points) that the sentence is elliptical, and has recourse to the expedient of accusatives *absolute*; and where also for ὅτι he substitutes ὁ τι, which he translates "wherefore?" not seeing that ὅτι introduces a quotation.

Müller's estimate of the authorities for the text is on the whole just; but he occasionally makes slips which show that he is not treading on firm ground. Why, for instance, does he represent Tischendorf as saying that  $\aleph$  was written by the scribe of B (p. 25), when in fact Tischendorf says that the New Testament of B was written by *one of the scribes of  $\aleph$* ? Why does he assume that the corrector of  $\aleph$  ( $\aleph^{**}$ ) collated this Epistle with a MS. written by Pamphilus (p. 29), when the corrector's notice of the source of

his collation is confined to a definite portion of the Old Testament? What authority has he for stating that the Latin MS. belonged to the German monastery of "Corvey an der Weser" (p. 22), when the facts point to the French Corbey, near Amiens, as its locality? Why, lastly, does he describe two Florence MSS. as 7 and 21 (p. 22), their true designation being Plut. lvii. No. 7, and Plut. vii. No. 21, thus omitting the number of the bookcase, and mentioning only the number of the volume in the case? The former of these two MSS. should not have been mentioned at all, for it does not contain this Epistle. It is the celebrated Greek MS. from which Voss first published the Ignatian Epistles in their shorter form. The Epistle of Barnabas is found attached only to the longer form of these Epistles.

Inattention to this distinction has misled Müller on another point, which is important. Jerome inadvertently quotes a passage from the Epistle as if from Ignatius (*Adv. Pelag.* iii. 2). This father's knowledge of the earliest Christian writings is very superficial: he most frequently quotes them at second-hand through Origen or Eusebius; and in this particular instance he may have derived the quotation, which is very remarkable, from the treatise of the former *Against Celsus* (i. 63), giving it from memory, and carelessly substituting the wrong name. Müller however, following Menard, Hilgenfeld, and others, gives a different explanation of the error. The Ignatian Epistles are followed in the existing MSS. by the Epistle of Polycarp, and this by the Epistle of Barnabas: but in the archetype of these MSS. some leaves containing the end of Polycarp and the beginning of Barnabas were wanting, and the transcriber, not perceiving this, has copied on continuously, thus welding the two Epistles into one, and making nonsense at the juncture. These critics suppose that the MS. which Jerome used was already mutilated in this way, and that this was the occasion of his mistake. If Jerome had quoted Barnabas under the name of Polycarp, the explanation would have been plausible enough: but as he names Ignatius, it is quite inadequate. Moreover, the phenomena of the MSS. are entirely adverse to such a supposition. This sequence of Polycarp and Barnabas is connected only with the longer Greek of the Ignatian Epistles. With the shorter recension it is not found. And we cannot without great improbability assume that the Epistles of Ignatius were known to Jerome in this longer form.

The date of this Epistle is fully discussed by Müller in excursus (p. 105 sq. and p. 334 sq.) on the two passages on which the decision mainly depends. He arrives at the conclusion that it was written A.D. 119. The first of these passages (c. 4) points, as he allows, to the age of Vespasian; for the ten kings of the prophet Daniel, as there interpreted, can only be explained of the first ten Caesars. Yet he explains the second passage (c. 16), in which the writer discusses the prediction of Isaiah xlix. 17, as if it referred to the hopes which Hadrian held out to the Jews that he would rebuild the temple. Thus he gets two different points of time in the two passages: and he can only reconcile the two by the lame expedient of supposing that in the first passage the writer refers to events which had occurred long before he wrote. This solution however is directly excluded by the words with which the interpretation of the prophecy is prefaced, τὸ τέλειον σκάνδαλον ἡγγικεν, and which confine the horizon to the immediate present. If so, the interpretation of the second passage must be wrong; and indeed the whole argument of the supposed Barnabas shows that he did not contemplate the re-erection of the temple, then recently destroyed, as a material structure, but referred to its rebuilding as a spiritual edifice, which was fulfilled in the rise of the Christian Church. Thus all contradiction between the two passages disappears.

It may seem captious to call attention to minor errors in a work on which so much labour has been expended, and which deserves the gratitude of all students of early Christian literature: but it must be regretted that this volume is disfigured by constant misprints; and in proper names such enormities as Usser, Coutelier, Delaroue, ought to have been avoided.

J. B. LIGHTFOOT.

**Apocryphal Acts of the Apostles**, edited from Syriac MSS. in the British Museum and other Libraries, by W. Wright, LL.D., Ph.D., &c. Vol. I. The Syriac Text. Vol. II. The English Translation. Williams and Norgate, 1871.

PROFESSOR WRIGHT, already known, in addition to his other works, by *Contributions to the Apocryphal Literature of the New Testament*, now favours us with a collection of *Apocryphal Acts of the Apostles*. Every fresh addition to our sources of information on so important a branch of early Christian literature must be cordially welcomed, for only a small part of the available material has yet been published. Of the text here brought together, some, such as the *Decease of John*, the *Acts of Andrew and Matthew*, the *History of Paul and Thecla*, and a large part of the *Acts of Thomas*, were already known in Greek; others, such as the part of the *Acts of Thomas* in which the Greek is deficient, and some sections of the *History of John*, only in Latin; while others, such as several more sections of the *History of John* and the *Acts of Philip in Carthage*, are now published for the first time.

The greater part of the *Apocryphal Acts of the Apostles* is no longer extant in the original form. With few exceptions they arose in Gnostic circles, and were composed with the object of presenting the mysterious doctrines of the Gnostics in a dress attractive to the people. These marvellous tales were read with avidity by the faithful, and the only impediment to the propagation of such teaching which the Catholic teachers could interpose was by putting forth of orthodox editions, in which the fascination of romance was retained, while the heretical doctrine was more or less carefully eliminated. To this circumstance it is due that considerable remains of the apocryphal literature have come down to our own time.

The texts which Professor Wright has now edited and translated belong without exception to the class of Catholic alterations of Gnostic writings, and the simple popular language in which they are written proves that in Christian Syria as elsewhere these narratives were designed for the people and not for theologians. They are also without exception translated from the Greek.

The story of the *Decease of John* (vol. ii. pp. 61-68) agrees almost verbally with the conclusion of the Greek *Acts of John* published by Tischendorf (pp. 272-276, Tisch.). Here and there however the Greek can be filled up from the Syriac. Thus in cap. 15 (p. 272, Tisch.), where, after πῶσα ἴδετε παρ' ὀφθαλμοῖς ὑμῶν, should be read ἃ ἡτοίμασεν ὑμῖν, μηδὲ τοῖς τοῖς ὀφθαλμοῖς ἑωραμένα, μηδὲ ταῦται ταῖς ἀκοαῖς ἡκουσμένα; and in c. 22, after the words καὶ εἰπὼν, "Be thou with me, Jesus the Messiah our Lord. Then he went down into the trench, where he had spread his clothes, and saying . . ." (vol. ii. p. 67). The genuineness of the latter passage is also shown by the Latin text in Abdias, *Histor. Apost.* v. 23. In other places words which are found in the Greek are wanting in the Syriac, e.g. c. 18, end, in the prayer of consecration, and just after, c. 19 (p. 63, foll. Wright), where in the Syriac, as was the case in Abdias, the direction of the apostle to dig his grave follows directly upon the Eucharistic feast. The disciple of John, who receives this command, is called Byrrhus, as in Abdias (the Greek

text has Εὐρυχὺς ὁ καὶ Οὐῆρος). Other variations from the Greek arise partly from other readings, partly from the inexactness of the translation. On the whole the Syriac represents a text which is much more closely allied to that edited by Tischendorf than to the Latin of Abdias.

The *History of Andrew and Matthew* (not Matthias) in the *City of Cannibals* (vol. ii. pp. 93–115) and the *History of Thecla* (pp. 116–145) agree in all essential points with the Greek text. Here and there the translation is inexact and paraphrastic; in some places the Syriac gives only extracts. For instance, it omits capp. 12–15 of the Greek text of the *History of Andrew and Matthew*; in c. 10 and 18 a few sentences are transposed; in c. 10, 20, 27, 29, the Greek text is shortened; oftener still, shorter sentences are omitted; and sometimes the text from which the translation was made seems to have differed from that of our Greek MSS. (c. 24, end, c. 26, 27, 28, 31). Additions are rare (c. 30, 32, 33), but several passages of the Greek may be filled up or corrected from the Syriac. Thus, in c. 19, after ἐπιστεύθημεν, insert, "For if thou didst utter them, heaven and earth would tremble" (vol. ii. p. 103); in c. 23, instead of ἀλλὰ ἀπολυθῆναι τὰς μαχαίρας ἐκ τῶν χειρῶν τῶν δημίων, the Syriac has, "Let their heads be paralysed, and let the knives fall and melt like wax before the fire" (p. 108). In c. 28 (p. 111), instead of τότε ὁ Ἰησοῦς εἶπε τῷ Ἀνδρέᾳ, the Syriac has, "And when he had said these things, a voice came to him in Hebrew, saying . . ." It is noteworthy, that the city of cannibals is twice called Medinat-Kalbin, which Dr. Wright renders "City of Dogs;" at the close of the story, the words "which is 'Īrkā" are added. Prof. Nöldeke conjectures that either the city of the Chalybis or Colchis is meant; he considers the identification of the cannibal-city with 'Īrkā, i. e. Arka in Lebanon, to be the malicious jest of a copyist.

The gain for textual criticism is more definite in the *Acts of Paul and Thecla*, in many parts of which the Greek text may be supplemented to a greater or less extent from the Syriac. This is the case with the beatitudes in c. 5 (vol. ii. p. 118, foll.); in c. 8, where the Syriac inserts the sentence "And Thamyras answered . . . see her" (p. 120); in c. 19, 20, 27–29, 33, where the Syriac text is fuller (pp. 126, 131, 135, &c.); and in other passages. Demas and Hermogenes are here described as coppersmiths (pp. 116, 124, cp. 2 Tim. iv. 14), and Tryphaena almost always (but only once in the Greek, c. 36) as queen.

Omissions in the Syriac of words or sentences extant in the Greek text are rare. In c. 2 the name of Lectra, in c. 28, foll. that of Falconilla, is wanting, and the sons of Onesiphorus, Silas and Zeno, are converted into sons of Simon, though in one passage (p. 117, top) Zeno is distinguished from them; comp. also capp. 14, 43. On the other hand paraphrastic readings occur frequently (c. 26, 28, 37, 41, &c.). The conclusion from cap. 44 onwards is omitted.

Greater importance, however, attaches to the *Acts of John in Ephesus* (pp. 3–60), and the *Acts of Philip in Carthage* (pp. 69–92). The latter was previously quite unknown; the former only known in fragments. It is true that a narrative which bears the name of Prochorus is extant in Latin, and in an incomplete form in Greek. But though it resembles our Syriac narrative in beginning with the separation of the Apostles, and the first acts of John in Ephesus, the greater part of it is occupied with the miracles of the apostle in Patmos. There is also a part of the Ephesian narratives to be found in Abdias, and in the so-called Mellitus (Melito). The Syriac text published by Dr. Wright, which also bears the title *Doctrina Johannis* (p. 60), claims for its author Eusebius, the church-historian, who is said to have "found

it in a Greek book" (p. 3). In another place the author mentions as his authorities the books in the archives of Nero (p. 9). The narrative begins with the separation of the apostles, and relates how St. John hires himself out as a servant with a bath-keeper, raises the son of the procurator who had died by a divine judgment in the bath, converts the procurator and the nobles and a great multitude, and at last even the priests of Artemis, and procures the fall of the idol. The name of the procurator is Tyrannus, and is obviously borrowed from Acts xix. 9. The fall of the image of Artemis, however, is told quite otherwise by Prochorus, Mellitus, and Abdias; the last mentioned also speaks of the resurrection of a profligate youth, but under quite different circumstances. On the other hand, the remaining narratives, which are given by Mellitus and Abdias, are wanting in the Syriac. The banishment of St. John is here placed, not under Domitian, but under Nero; a fearful vision compels the emperor to recall his command, on which the apostle passes the rest of his life unmolested in his cottage near the former temple of Artemis, and at last, at the wish of Peter and Paul, who visit him in Ephesus, composes his Gospel. It is worth while to notice the chronological statements as to the age of John, who is said (p. 59) to have lived 120 years, and the duration of the ministry of Christ (p. 15), which is reckoned at something over two years, from the 30th to the beginning of the 33rd year of his age. This calculation varies equally from the earlier chronology, and from that which has prevailed since Eusebius, and seems to have arisen independently out of the fourth Gospel. It does not, however, follow that the present text of the *Acts of John* is older than Eusebius; in fact, he is well acquainted with the full Christological formulas of the fourth century. The conception of Christ took place, according to our author, through the ear of Mary (pp. 7, 14, &c.), an opinion which was afterwards sanctioned by the Catholic tradition, and popularised by painting, and which doubtless appears here for the first time. The name *Doctrina Johannis* is justified by the long speeches and sermons which are put into the mouth of the apostle. The contents are of a sound Catholic tendency, the last vestiges of Gnosticism being effaced; such a phrase as "the children of the left hand" (p. 4) is perhaps the only one which reminds us of the Gnostic περίοδοι Ἰωάννου. This circumstance, as well as the large number of the still extant and very various reproductions of the *Acta Johannis* in a Catholic sense, seem to show that the histories of this apostle were read by the Catholics with especial diligence.

Of the old περίοδοι Φιλίππου we possessed up to this time four separate fragments, the *Acts* of the apostle in Scythia (in Abdias and Symeon Metaphrastes), those in Greece (in Greek, see Tischendorf, p. 95, foll.), and two narratives, the scene of which is laid in Hierapolis, the one preserved in the great *Menaia* of the Greeks, the other, with the *Martyrium* of the apostle, in Greek (Tischendorf, p. 75, foll.) and Latin (*Acta Sanctorum*, May 1).

The last mentioned passage is distinguished in the Greek text by the heading ἀπὸ πράξεως πεντεκαδεκάτης μέχρι τέλους, ἐν αἷς τὸ μαρτύριον. A new portion of the πράξεις hitherto missing has now been discovered in Syriac; it seems to have formed the commencement of the narrative. It relates the journey of the apostle from Jerusalem to Samaria and Caesarea, his marvellously quick voyage to Carthage, during which he converts the Jew Ananias, the sermon and murder of the latter in the synagogue at Carthage, with his resuscitation by Philip, and the final expulsion of the unbelieving Jews. That the περίοδοι Φιλίππου consisted in great measure of controversy with the Jews; this is confirmed by the *Acta Philippi in Hellade*, and the history which it contains

of the unbelieving high-priest. The conclusion of the Syriac acts, however, reveals a comparatively mild disposition towards the Jews. It represents the Carthaginian Jews, guilty as they were of unbelief, of murder and perjury, as spared further punishment, because the Jewish law of retaliation was abolished in Christianity. Not less remarkable is the chronological notice on p. 78, that the devil had been expelled from Carthage after having sat on his throne for 3795 years. As Prof. v. Gutschmid has pointed out to me, the year 3795 is, according to the ordinary Jewish era, the year from autumn 33 to autumn 34 A.D., i.e. the first or one of the first years after the Crucifixion. This, then, is the first known instance of the use of the Jewish era of the Creation, which has been commonly supposed to have arisen in the middle of the fourth century. The document from which this notice is taken, and which forms the basis of our Acts, cannot, it is true, be older, but is apparently at least not younger than the third century. Besides, the use of the Jewish era is not the only indication of the Jewish culture of the author. It is corroborated by the special interest which he takes in the Jewish people, and still more by the remarkable collection of Jewish traditions about the Old Testament prophets (pp. 83, 84). The original Gnostic character of this as well as other narratives is clear from the nature of the miraculous stories they contain, e.g. those of the miraculously swift voyage, a detail which recurs in the *Acts of Thomas and Andrew*, of the mysterious apparition of the body of the murdered Ananias, and of the speaking and miracle-working oxen.

But the most valuable part of this new collection is formed by the *Acts of Thomas*, which are given here in a much more complete form than in the Greek. The book is divided into nine acts. The first three, the fifth and sixth, correspond to the Greek acts edited by Thilo and Tischendorf; Acts vi. and vii. contain the histories of the generals of king Mazdai, and of Mygdonia and Karish (Charisius); while the last section consists of the *Consummatio*, which is also extant in Greek (Tischendorf, p. 235, foll.) and Latin (Abdias, ix. 22, foll.). In the 7th act, the Syriac omits some of the miracles related by Abdias (capp. 14, 15); as a compensation for this the 4th act, the story of the speaking ass (pp. 179-181, Wright), is quite new. Several narratives and speeches are also new in the 7th and 8th acts, especially the hymn of the soul (pp. 238-245), and the following hymn (pp. 245-251). The Syriac text is less original than that of the Greek acts. The Gnostic features, which constitute the value of the book for church-history, are almost entirely effaced, and replaced by Catholic. The Gnostic prayers and hymns to Achamoth are changed into prayers to Christ; the Christology is the Nicene, but with echoes of Sabellianism (pp. 153, 173, foll., 187, foll., 208, 249, 267, 288, foll.). A strong light is thrown on the process of Catholic rewriting by the hymn on p. 195 of Tischendorf's edition compared with p. 150 of Wright's English translation. "The girl," "the daughter of light," by whom the original writer meant Achamoth, becomes in the Syriac the church; the chorus of the thirty-two aeons, who sing praises to her, the twelve apostles and the seventy-two disciples; at the words "groomsmen" and "bridesmaids" the number seven, which distinguishes them as the seven Archontes and their companions, is struck out; and in like manner the twelve servants, i.e. the twelve zodiacal spirits, are removed. On the same principle the Gnostic baptismal prayer (p. 213, foll. Tischendorf; cp. p. 166, foll. Wright), the speech of the dragon (p. 217, Tisch.; cp. p. 171, Wright), and other passages, are rendered more Catholic in tone. The Gnostic rites, especially those at baptism and chrism, are also carefully removed, and the Catholic usages substituted (cp. especially p. 166, Wright, with p. 212, foll.

Tisch.; also p. 188, &c. Wright). Once, in the speech of the wild ass (p. 214, foll.) there is even a polemic against the Gnostic rejection of conjugal society, which is certainly in strange contradiction to the narratives of the book itself.

In spite of all the care of the orthodox editor, a few traces of Gnostic speculation are still visible, e.g. "mother of seven houses, whose rest was in the eighth house" (p. 166), and a few expressions in the prayer of Thomas in prison (p. 279, foll.). The *Hymn of the Soul*, pp. 238-245, deserves particular attention. It is an unadulterated Gnostic poem, which is not, like the rest, translated from the Greek, but was written originally in Syriac, and by a happy accident has been inserted in the *Acts of Thomas*, with which it has absolutely no connection. The metre is hexasyllabic. The hymn treats, under the figure of a king's son, of the fortunes of the soul, which has been sent down from its celestial country, to fetch the pearl watched by the snake here below, but forgets its commission, till it is reminded of it by a letter from the father, the mother, and the brother, "the second (in authority)," (i.e. *πρώτος ἀνθρώπος*). Then the soul fulfils its commission, receives back its bright robe, and returns to its country. As for the geographical setting of the parable, Egypt is described as the lower world, the kingdom of the East, or Parthia, as the heavenly country, "Sarbug" (?), Babylon, and the great Maishān (Mesene), "the haven of merchants," as the stations touched by the returning soul. As the other geographical notices also prove, the song was written in the regions of the Euphrates. The form of the Gnostic ideas points to the teaching of the sect of the Ophites, but not to that party which worshipped the serpent as queen of heaven, but that which saw in her the evil world-soul. The part which Egypt plays in the hymn reminds us of the similar fancy of the Naassenes and Peratae in Pseudo-origenes. The hymn can scarcely have been composed by Bardesanes, not so much on account of the metre, as of the contents, which do not altogether tally with the peculiar doctrines of Bardesanes, as gathered from Ephrem. Besides, the thought which it develops recurs in the most different turns of expression in almost all the Gnostic systems. The date of composition is at any rate considerably earlier than the present Syriac translation of the *Acts of Thomas*. For it is certain that the latter is not earlier than the fourth century, whereas the hymn must have been written in the time of the Parthian empire, i.e. before 229.

The hymn to the Father and the Son, however, which immediately follows that of the soul (pp. 245-251) is of Catholic origin. Abdias has as little knowledge of the one as of the other; but what he offers us is nothing but a mere epitome of the Greek original. A comparison of the corresponding sections with the Syriac shows that Abdias largely abridged not only the speeches, but also the narratives, and omitted many passages which were in his view offensive, e.g. the description of the outrages which the wife and daughter of the general had to suffer from demons (p. 201, foll. Wright), the story of the wild asses which were yoked in the chariot of the apostle, the miraculous ejection of the demons by one of the asses at the apostle's bidding (p. 206, foll.), and much besides. Variations in the two narratives are of frequent occurrence. Thus the Syriac mentions a double examination of Thomas before king Mazdai (p. 262, &c., 274, &c.), which Abdias (ix. 13) merges into one. Abdias, too, knows (c. 24) only one parting prayer of the apostle, the Syriac two (p. 276, foll., 296). It is remarkable, on the other hand, that both in the Syriac and the Latin the name of the general is not mentioned till afterwards in the history of Mygdonia and Karish. The Syriac, too, calls him *Sisār* (p. 233), which agrees with the Sapoires of Abdias. The names of the other persons are really the same as in the

other texts, though the original forms are only partly preserved. The king is called Mazdai (Μαζδός, Mesdeus), the queen Tertia (so also in the Greek; Abdias has Treptia), the king's son Vizān (Ιουζάνης, Zuzanes), which confirms Gutschmid's conjecture, that Ιουζάνης conceals the Persian name Wfjan.

In the section corresponding to the Greek acts, the Syriac sometimes gives the means of improving the Greek original. Thus on p. 214 of the latter the words of Codex A, rejected by Tischendorf and bracketed by Thilo, are partly confirmed, partly supplemented by the Syriac. The correct reading will be, ἡ δὲ ἀπληροῦσα . . . διαρπάζουσα τὰ ἀλλότρια καὶ ὑποψίαν ἔχουσα μὴ ἀποδιδούσα τὰ ἀλλότρια τοῖς δεσπόταις αἰσχυνθῆ, and just afterwards, ἡ δὲ ἐργασία τῆς κοιλίας εἰς φροντίδας . . . ἐμβάλλει τὴν ψυχὴν, μεριμνῶσαν μὴ ἄρα ἐνδεῖς γένηται καὶ τῶν πόρωνθεν αὐτοῦ ὄντων θηρατὴν (instead of θεατῆ). After the speech of the dragon (p. 218, Tisch., p. 172, Wright), at the beginning of c. 33, the Syriac adds a few sentences which are wanting in the Greek. Similarly, there is a long section which is wanting in the Greek at the beginning of c. 34 (p. 219, Tisch.; p. 173, Wright)—the song of the youth raised from the dead: but the distinctly Catholic tone proves that it has lost its original form. A short addition also occurs in the words of the young man (c. 51, p. 194, Wright); and several other instances might be given: e.g. pp. 196, 198 (end of c. 54 and c. 56). A more important deviation from the Greek occurs in pp. 195, 196 (pp. 230, 231, Tisch.), in the speech of the girl. On the other hand, it deserves to be noticed that the very passages in which the Greek offers few if any traces of Gnosticism are given with great fidelity in the Syriac. The unavoidable inference is that our *Acts of Thomas* have undergone repeated Catholic redactions, and that the form which they assumed after the first of these was that which the editor of the Syriac translation had before him.

In the last act (p. 292, &c.), on the other hand, the Syriac text agrees pretty closely with the Greek τελείωσις Θωμᾶ (p. 235, &c. Tisch.), at least if we except the two first chapters of the latter, which present only a short extract of the foregoing narratives. Here again the Greek text may sometimes be filled up and corrected from the Syriac, the readings of which are often confirmed by Abdias, though he too gives a mere extract from the original. The words on p. 293, "And they rose early—told thee the truth," are wanting in the Greek, but occur in a condensed form in Abdias. In the reply of Thomas to the king (c. 4, p. 237, Tisch.), instead of οὐκ εἰμι δούλος καὶ τὴν κατ' ἐμοῦ ἐξουσίαν οὐκ ἔχεις οὐδὲ ὅλως, it is preferable to read with the Syriac (p. 293) and with Abdias, εἰμι δούλος, ἀλλὰ σὺ κατ' ἐμοῦ ἐξουσίαν, κ.τ.λ. But the reading of the Syriac on p. 294 is manifestly wrong, "Of what country art thou?" instead of "is he," as the Greek and Abdias read. In c. 10, after συνήγοντο πάντες οἱ ἀδελφοί (p. 240, Tisch.), the Syriac (p. 297) inserts a few words; while some lines afterwards (c. 11) it omits a few. The speeches and prayers in this part are again more original in the Greek than in the Syriac; e.g. c. 6 (p. 238, Tisch.; p. 295, Wright), and c. 8 (p. 239, Tisch.; p. 296, Wright). In both places Abdias has in part preserved the Gnostic colouring more faithfully than the other two. At the end of the work, both the Syriac (p. 298) and the Greek contain a notice that the bones of the apostle were taken away secretly, and conveyed to the West, while Abdias states with greater precision that they were removed to Edessa.

These remarks may serve to bring out the great importance of the writings collected by Prof. Wright. It may be added that the portions now published for the first time are of value to the historian of dogma, especially for the Christological views and the ritual observances of the first

centuries. With regard to the former, it is worth while to notice the frequently recurring allusion to Christ's outwitting of the devil (pp. 45, 78, 184, 279); and with regard to the latter, the very full description of the usages at baptism (p. 38, &c., 53, &c., 166, &c.), and at the Lord's Supper (p. 54, &c., 188, &c.), the mention of infant baptism (p. 42), and of the Eucharistic sacrifice (p. 55), as well as the custom of inscribing the sign of the cross on gates and ecclesiastical buildings (p. 55). But before parting from the work, let us express our hearty thanks, not only to the editor, but to Prof. Lightfoot, of Cambridge, who has generously borne the entire expenses of publication. R. A. LIPSIVS.

Religious Thought in England from the Reformation to the End of the Last Century. A Contribution to the History of Theology. By the Rev. John Hunt, M.A. Two volumes. Strahan and Co.

CONSIDERING the wide interest aroused in England at all times by religious questions, it is a matter of wonder that there is no history of religion in England which can take rank as a permanent book. We have many histories of the church, or books calling themselves so, but hardly any of them rise above the level of controversial pamphlets, in which the facts of the past are grouped into a case in favour of the writer's opinions. Mr. John James Tayler's *Retro-spect* is indeed a book of a higher character, and is not so well known as it would be, were it not supposed, quite groundlessly, to be a "unitarian" history. Mr. Hunt may justly say that he is dissatisfied, and supposes most men are, with the spirit in which the history of religion in England is generally written. Mr. G. G. Perry's *History of the Church of England* is the work of a liberal-minded man, but is avowedly written from the point of view of the modern High Church party.

Mr. Hunt's two volumes are offered not as a history of ecclesiastical affairs, nor as a history of theological learning. His subject is intermediate between these two. He proposes to describe the successive prevailing phases of religious opinion, from the reformation to the end of the last century. To designate this subject-matter, Mr. Hunt is obliged to use a term to which there are strong objections, viz. "Religious Thought." But as no one has yet suggested a better, we must suppose that the language has no term for this complicated set of phenomena. Church, State, Literature, Art, Philosophy, Science—each of these names denotes a definite collection of facts, and each such collection of facts or phenomena can have, and has, its history. But what class of phenomena is intended by the term "religious thought"? Does it really mean anything substantially distinct from "theological literature"?

The answer must be that it does. "Religious thought" is not used by Mr. Hunt as an equivalent for "theological literature." He does not aim at being an ecclesiastical Hallam, and writing supplementary volumes to Hallam's *History of Literature*. Much rather might Mr. Hunt's work be said to be supplementary to Buckle's *History of Civilisation*. Neither books nor events are his subject, but opinion. It is true that neither the Christian creed nor the principles of Theism have been substantially changed since the reformation, yet the current opinions, sentiments, feelings, language, mental habits, which regard the permanent creed, have been in constant flow, and still flow on; "labitur et labetur." This flux of "thought" Mr. Hunt has taken for his subject—a highly interesting class of facts, but also one most difficult to seize and disentangle.

We all remember how in a cognate subject Mr. Buckle began his first volume by severely censuring the historians for describing the succession of events instead of tracing

the law of the succession, and how he ended in his last by doing exactly as they had done. We are not quite certain that Mr. Hunt has remembered his own definition of his object, "which is to trace the current of religious thought, and not to write a history of theological literature." He proposes to himself a history of the succession of ideas, but he slides into an analysis of the contents of books. But of the ideas which are consigned to books, only a very small fraction is taken up into popular opinion and becomes part of active thought. Circulating capital and fixed capital are two different quantities. Each man's mind contains a portion of ideas which is the common property of thinking men in his generation, and a portion which is peculiar to himself and a select class. The latter, or special knowledge, constitutes learning. It is of the former portion, or the sentiments shared by a writer with his age, of which Mr. Hunt intends to be the historian. If he has not always sufficiently kept this intention in view, and has allowed himself to analyse books in chronological order of publication, the sufficient excuse must be found in the evanescent nature of the subject, which is apt to elude the grasp. As a survey of the religious literature of England for the seventeenth and eighteenth centuries, Mr. Hunt's volumes have the field to themselves. There is no other book in which the information here brought together can be found. Mr. Hunt assures us in the preface that "in no case has the information been taken at second-hand!" Even a cursory inspection is sufficient to convince anyone that the notices are derived from original study of the authors. We have the contents of a vast library of books condensed in two convenient octavos.

MARK PATTISON.

#### HEBREW TEXT OF PSALM CXXXVII. 5.

##### TO THE EDITOR OF THE ACADEMY.

SIR,—The second clause of this verse presents a difficulty of which no tolerable solution has, so far as I am aware, been yet proposed. In the Authorised Version the difficulty is got over by the addition of two words to which there is nothing corresponding in the original text:

"If I forget thee, O Jerusalem,  
Let my right hand forget [her cunning]."

The ancient versions give no help: LXX—"Let my right hand be forgotten;" Syr.—"Let my right hand forget me;" which, strangely enough, De Wette adopts.

Modern expositors are not more successful. Ewald: "so vergesse meine Rechte sich." Delitzsch: "versag' mir die Rechte." Others judiciously leave the sentence incomplete. Thus Küster and Hupfeld: "so vergesse meine Rechte . . . ."

The case appears to be one in which an emendation of the text may with propriety be resorted to as our only resource; and I, therefore, venture to suggest for consideration whether, instead of יְמִינִי תִשְׁכַּח, we should not read יְבֵשׁ כַּף יְמִינִי. In the ancient Aramean character the difference between כַּף and יָד is not great. The passage will then stand thus:

אִם אֲשַׁכַּח יְרוּשָׁלַם  
יְבֵשׁ כַּף יְמִינִי  
תִרְבַּק לְשׁוֹנִי לְחֻמִּי  
אִם לֹא אֲזָכְרֶכִי

"If I forget thee, O Jerusalem,  
Let the strength of my right hand be dried up;  
Let my tongue cleave to the roof of my mouth,  
If I do not remember thee," &c.

The alteration, though slight, removes the grammatical difficulty, improves the rhythm of the Hebrew, and is, besides, borne out by comparison of Ps. xxii. 16 (15), where "My strength is dried up (יְבֵשׁ כַּף)" like a potsherd," is parallel to "And my tongue cleaveth to my jaws."

DUNCAN H. WEIR.

#### Intelligence.

It gives us much pleasure to notice Mr. Matthew Arnold's tasteful revision of the second part of Isaiah, with a slightly pretentious but very interesting preface. There is no reason why the more obvious results of technical scholarship should be withheld from the rising generation, or why "the children of the people" should not be introduced to the one great literature for which they have had some preparation. Mr. Arnold's object accordingly is, "not to present an absolutely correct version of the series of chapters treated, but merely to remove such cause of disturbance as now, in the authorised version, prevents their being read connectedly" (p. vi). He speaks in a tone of satisfaction, which we cannot pretend to share, either as lovers of English or of exact scholarship, of the attempt now being made at Westminster to revise the Bible of 1611. He is himself a puritan in the matter of Bible English, and his corrections are studiously devised so as not to impair the effect of the diction or disturb the balance of the rhythm. Though heartily endorsing his views, we question whether there may not be room for another kind of translation, such as that of Mr. Cheyne, which simply aims at rendering the original accurately in appropriate English, and in so aiming is compelled to retain a good deal of the earlier fabric. No doubt, as Mr. Arnold shows at some length, this translator's "affectionate reverence" has withheld him from several (from his point of view) salutary though less important corrections. But in one point, which Mr. Arnold touches upon with some earnestness, Mr. Cheyne could not have acted otherwise than he did without a gross dereliction of his principles. "Those noble and consecrated expressions," as Mr. Arnold calls them—law, judgment, and righteousness—are often found the greatest obstacles to a distinct apprehension of the prophet's meaning. Mr. Arnold states, and we are bound to believe it, that he has learned enough Hebrew to follow critical commentaries. But is it certain, or even probable, that certain words in xl. 2 mean "her sin-offering is accepted" (p. xxv), and "double for all her rue (!)" (p. xxvi, where, by the bye, Mr. Cheyne's view of the passage is exactly inverted)? Can Mr. Arnold's renderings of xlv. 9, 11 be justified, even as paraphrases? And is it consistent with his principles (see p. xvii) to correct lix. 19, and leave xli. 2, especially as the authorised version of the former passage, though erroneous, is both lucid and grand, and that of the latter neither one nor the other? On the other hand, not a few of Mr. Arnold's corrections are either the best possible or as good as any others which could be proposed. Two in particular may be mentioned—xlii. 19, "who is blind as God's liegeman?" and liii. 2, "he grew up before him as a slender plant" (thin and insignificant, not tender and cherished). The latter rendering might have been further supported by Ezek. xvii. 22. The notes are beautifully terse, and supply all that "young learners" are likely to require. One word in conclusion. It is too bad of Mr. Arnold to bring such a sweeping charge against German critics on p. xxxiii. He seems to be unaware that his own view of the "Servant" is essentially that of Knobel. And on what authority does he assert that Ewald, "in order to save [his] hobby," tampers with the text at the opening of ch. xlix.? These are traces of dilettanteism which disfigure an otherwise admirable work.

Our esteemed contemporary, the Roman Catholic *Literaturblatt*, of Bonn, contains (January 29) a critique of *The Speaker's Commentary*, which should have been noticed before, but through some accident has only just come to hand. The writer, Professor Reusch, agrees with our own reviewer (*Academy*, vol. ii. p. 335) in recognising the thoroughness of this work in most questions connected with archaeology, which he contrasts with the meagreness of the "strictly theological" element, and the comparative superficiality of the critical sections. Dr. Fell, the Egyptologist, of Cologne, subjoins a detailed examination of Mr. F. C. Cook's appendices on Egyptian history and philology. We are sincerely glad of his testimony to Mr. Cook's Egyptian scholarship, which has been unreasonably called in question by an eccentric writer in the *British Quarterly* (January). Dr. Fell, however, differs from Mr. Cook in many points, and maintains the ordinary view, according to which the exodus took place under King Menephthah, at the end of the nineteenth dynasty, and not, as Mr. Cook thinks, under Tuthmosis II., of the eighteenth dynasty. On the other hand, he endorses Mr. Cook's view that "the writer of the Pentateuch" possessed an accurate knowledge of the Egyptian language, and that this constitutes a strong presumption in favour of the Mosaic authorship. It should be remarked, however, that the relations of Egyptian to the Semitic languages are as yet far from being established with such precision as to justify so positive an assertion and so sweeping an inference. And we see no evidence that either Dr. Fell or Mr. Cook is acquainted with the actual situation of the Pentateuch controversy.

Prof. de Lagarde announces an edition of the Reuchlin codex of the Targums on the Prophets. Subscribers' names are requested.

### Physical Science.

*Geology of Oxford and the Valley of the Thames.* By Professor Phillips, F.R.S. &c. Clarendon Press, 1871.

IN the earlier days of geological enquiry, when men longed to have some clear notions of geology, it was not unusual to publish broad outlines of the geological structure and composition of a country. Sometimes these outlines appeared in the form of a map, sometimes in that of a treatise. They were necessarily very sketchy; and even when they gave correctly some of the leading features of geological structure, they often misrepresented others, or at least traced them with the imperfection which characterized the science of the time. Admirable, however, were some of these early attempts. No one can look, for example, on the maps of William Smith without astonishment at the sagacity and clearness of observation which guided their preparation. In later years came the desire and the necessity for filling in the details of the work outlined for us by the pioneers of English geology. Instead of maps or descriptions of the whole country or of entire geological systems, there appeared detailed notices of special districts—notice which bear the same kind of relation to the earlier works that elaborate modern county histories do to the older text-books of the general history of the country. This parallel may be extended to the remark that in geological as well as in political history the materials for research have now accumulated to so vast an extent that the full treatment of either the social or geological annals of one country is almost beyond the compass of a single writer. He must content himself with the story of one or two great periods, or he may betake himself to the task of tracing the records of one district, and showing how far they throw light upon the general march of historical development in the country viewed as a whole. It is this latter kind of treatment which is exemplified in the volume before us.

Into no abler or fitter hands could the geological history of the Thames Valley have fallen than into those of the genial professor of geology at Oxford. Old enough to have seen some of the splendours of the dawn of English geology,

and to have known not a few of the early leaders, and related by near ties of kinship to William Smith, the greatest of them all, Professor Phillips moves among us with a kind of antique glory. We reverence in him the traditions of the past. But he has other and higher claims. Trained in the school of Smith, Buckland, and Conybeare, he has been intimately associated with the progress of geology in England for half a century. As an original investigator he has done much to elucidate the geological structure of the country and the nature of its former inhabitants; at one time working by himself, as in Yorkshire, at another time in concert with his colleagues of the Geological Survey, in Wales, Devon, and Cornwall, the Malvern Hills, and other tracts. As one of the earliest and most laborious members of the British Association, he has unquestionably given an impetus to the spread of a desire for geological information throughout the country, and now for the last sixteen years he has been at work sowing the same desire among the youth at Oxford. No man could more appropriately have undertaken the task of gathering up the sum of all that is known regarding the rocks which enclose and underlie the great valley of the south of England, and respecting the ancient tribes of plants and animals of which these rocks are the tombs.

The valley of the Thames, as Professor Phillips treats it, contains more or less perfectly developed representatives of all the great geological formations from the oldest fossiliferous rocks of England up to the most modern alluvium. Far to the west, and, in a strict sense, beyond the limits of the valley, lie the ancient formations which rise into the picturesque outlines of the Malvern Hills. Eastwards beyond London stretch the gravels and brick-earths from which the later extinct mammalia and the earliest traces of man have been found. Between these limits the Secondary rocks, rich in fossils, and exposed in many natural and artificial sections, spread all over the country of which Oxford is the centre. Hence, in treating of the geology of Oxford, Professor Phillips brings before his readers no mere local details. The history of his district is in reality in great part the history of the whole country, and this fact he makes abundantly clear in the present volume.

Starting with a brief *résumé* of the historical notices of Oxford geology, and paying a kindly tribute to the memory and the labours of his early friends, the author sketches the general physical features of the Thames Valley—hills and vales, rivers, rainfall, springs, and water supply. He then passes on to describe the various geological periods, beginning with the oldest and rising through the long series up to recent times and the changes which are going on now. His most ancient rocks are those of the Malverns, the metamorphosed portions of which he classes as belonging to the "first or gneiss period of Malvern." Though there may be great doubt as to the real geological age of these rocks, it seems a pity now-a-days to talk of a "gneiss period" when the metamorphic origin of the gneissic texture is fully recognised, and when the use of such a phrase, though intelligible enough, sounds somewhat like a resuscitation of the long extinct Wernerian dogma of the precipitation of the Gneiss and the Schists from a *primaeval* ocean. Next come the Cambrian, Silurian, Old Red Sandstone, Carboniferous, and Permian rocks, which, as not strictly coming into the Thames Valley, are rapidly described along with the fossils characteristic of each formation.

It is the Secondary systems which are of course most fully treated by Professor Phillips, and as a text-book for these his volume will be chiefly valued. Beginning with those curious shales in the vale of Severn to which the name of Rhaetic has been given, he describes in considerable detail the subdivisions of the Jurassic and Cretaceous systems

and their more marked organic remains. The Oolites, as might be expected, are elaborately described, more especially those subdivisions which occur so markedly around Oxford, and of which the organic contents are so well illustrated in the University Museum. The nature of the strata of each subdivision is described along with the changes which they show in thickness or other characters as they are traced across the district. At the end of the account of the rocks of each period comes a full list of the fossils peculiar to or characteristic of each formation. This part of the book is admirably executed. The lists themselves are valuable for reference. Not less so are the short but lucid generalisations by which they are accompanied. Their most important feature, however, is the detailed description given of many of the species, particularly of the Oolitic Vertebrates. Professor Phillips has the faculty of making the dry bones live again for us. As he arranges jaws, skulls, teeth, ribs, and vertebrae before our eyes, the antique animal seems to career through the waters as it used to do among Ammonites, Belemnites, and other long extinct forms. In his careful analyses of the structure of Megalosaurus and Ceteosaurus he has not only done much for the elucidation of the palaeontology of his district, but has made an important contribution to our knowledge of the extinct Saurians which peopled the rivers and seas of England during the Middle Secondary periods.

Professor Phillips pauses now and then to note the bearing of his subject upon some of the wider questions of science which are now engaging attention. For instance, after describing the wonderfully complete series of fossiliferous strata forming the Oolitic system of England with its great diversities of organic remains, and the long period of the earth's history which it chronicles, he takes notice of the light which it may cast upon such questions as the origin of species. His reference, however, is tantalizingly brief, nor is it always as clear in phraseology as other parts of the book. Assuredly in this country, at least, no such basis of palaeontological evidence can be found for testing the worth of theories of the origin of species and genera as that furnished by the richly fossiliferous Jurassic series of rocks. And we should have been glad to have from the Professor of Geology at Oxford some fuller exposition of the conclusions to which his life-long labours among these rocks have led him.

In the last two chapters we are presented with some general and cautiously expressed views regarding the waste of the surface of the Thames Valley, and the origin of its outlines, and with some information respecting the economically useful minerals furnished by the district. The volume is illustrated with maps, sections, and numerous plates of fossils. It may be cordially and confidently recommended to all geologists to whom the Secondary rocks of England are a subject of interest.

ARCH. GEIKIE.

**Geographical Botany.** [*Die Vegetation der Erde nach ihrer klimatischen Anordnung.* Ein Abriss der vergleichenden Geographie der Pflanzen. Von A. Grisebach. 2 Bände.] Leipzig: Engelmann.

THE science of Geographical Botany is yet in its infancy. In English, we have no extended work on the subject; in fact, if we exclude books treating merely of the floras of limited areas, valuable as far as they go, our original literature on the subject is almost confined to the slight sketches by Dr. Hooker comprised in the Introductory Essays to his *Floras of New Zealand and Tasmania*, and in his lecture on Insular Floras, delivered at the Nottingham meeting of the British Association in 1866. On the Continent the earliest publication of importance was an offspring of the gigantic

intellect of Humboldt, his *Essai sur la Géographie des Plantes*, published in French and German in 1805 and 1807; this was followed by a Danish work by Schouw in 1822, and by Meyen's *Grundriss der Pflanzengeographie* in 1836, a translation of which by the Ray Society is the only treatise on the subject accessible to the English reader; while the standard work hitherto, and the most recent of any high scientific value, is De Candolle's *Géographie botanique raisonnée*, published in 1855. It is therefore with no ordinary interest that botanists have expected the publication of the present work. Professor Grisebach's intimate acquaintance with the vegetable productions of several widely separated portions of the surface of the globe, as evinced by the local floras which he has already published or edited, promised a contribution to botanical literature of no small value.

The first impression on opening the work is one of disappointment. We look in vain for those wide general views, for those philosophical generalisations which should characterize a work of this nature, the result of the unwearied investigations of years. Indeed in this respect Professor Grisebach's work will not bear comparison with the far slighter sketches by Dr. Hooker to which we have already alluded. The same failing in the mode of treatment characterizes the arrangement. To a closely printed work of upwards of 1200 pages, consisting of an immense mass of details, we have a table of contents of ten pages only, and no index whatever; so that, if we wish to ascertain the geographical range of any particular class of plants, or to turn to the author's views on any contested point, we have no resource but to look till we find it. The only excuse for this serious drawback to the value of the book is that the author is but following, though perhaps carrying to an excess, the custom of his countrymen. When once however we have allowed for these defects, and have fairly waded into the depths, our first feeling of disappointment gives way to one of admiration and delight at the enormous mass of information, worked out with infinite care and labour, here placed before us.

The phytogeographical regions of the surface of the earth hitherto most generally adopted are those proposed by Schouw, twenty-five in number, each region being formed dependently on the extent to which its flora is endemic or peculiar to it. Grisebach divides the world into nearly the same number of regions, but takes into account, besides the endemic character of the flora, various other considerations—as, for instance, the general external features of the vegetation; and hence his boundaries differ materially from those of Schouw, and some of them are entirely new. They are as follow:—1. The Arctic Flora (of both continents). 2. The Forest Region of the eastern continent. 3. The Mediterranean. 4. The Steppes (of Central and Western Asia). 5. China and Japan. 6. The Indian Monsoon Region (including the whole of the Archipelago). 7. The Sahara (North Africa except the Mediterranean coast, and Arabia). 8. Sudan (Central Africa). 9. Kalahari (the western district north of the Cape). 10. The Cape. 11. Australia. 12. The Forest Region of North America. 13. The Prairies (including the south-western portion of the United States). 14. California. 15. The Mexican Region (including the greater number of the States of Central America). 16. The West Indies (including Yucatan). 17. Cis-equatorial South America (excluding the Andine region). 18. Hylaea (Tropical Brazil). 19. Brazil (south of the Tropics). 20. The Tropical Andes. 21. The Pampas. 22. Chili. 23. The Antarctic Forest Region. 24. Oceanic Islands (including New Zealand and Madagascar). This sub-division undoubtedly possesses greater claims to be considered a natural one than any that had been proposed before. The

regions necessarily vary extremely in size. The Forest Region of the eastern continent includes the whole of Europe excepting the extreme south, and nearly the whole of Northern Asia south of the Arctic Circle; while the regions of California and the Cape are scarcely larger than Great Britain, and that of Chili is considerably smaller. Exception may no doubt be taken to some of the details. The flora of North-western Australia shows so close an affinity to that of the Malay Peninsula and the East Indian Archipelago that it is doubtful whether they can rightly be separated; and the recent researches of Dr. Welwitsch would seem to indicate the existence in Central Africa of more than one distinct flora.

In the details of each region Grisebach follows a plan suggested by Humboldt. After discussing the climate, natural and geological features of the country, and other general matters, he examines the vegetation under seven distinct heads, classified, not according to the natural affinities of the plants, but their external facies and habits, as follow:—1, woody plants; 2, succulent plants; 3, climbers; 4, epiphytes; 5, herbaceous plants; 6, grasses (including sedges and rushes); and 7, cellular plants (or the lowest forms of vegetation).

The real value and interest of the study of the Geographical Distribution of Plants lie in the light which it throws on the great question of the mode of origin of the infinite variety of life found at the present time on the surface of the globe; and to this end the vast assemblage of facts here collected will be of inestimable value when carefully collated and analysed. It has always seemed to us that the solution of the problem of the Origin of Species may be looked for more hopefully from a careful study of the vegetable than of the animal world. Plants, being fixed to the same spot for the whole of their lives, and unable therefore individually to choose the conditions most favourable to their growth and perfect development, must be to a greater extent than animals the creatures of the circumstances that surround them; and hence we ought the more easily to be able to trace the steps by which each form has supplanted its proximate ancestor. Towards this consummation we have, however, made but very little progress at present.

We are now so familiar with the idea that organisms which present a close similarity in the essential points of their structure have descended from a comparatively not remote common stock, that we are apt to forget that it is only within considerably less than fifteen years that the writings of Darwin and Wallace have forced upon the greater part of the scientific world the conviction of the truth of the theory of evolution. Prof. Grisebach is a supporter of the older doctrine of the original distinction of species, and of the all but exploded theory of "centres of creation." "Only," he says, "at certain places has the earth disseminated the first germs; but these places were innumerable, and arranged without symmetry, like the stars of the firmament, and each one has the capacity to produce a definite organic formation. Each natural flora is a separate creation, springing from an exchange between its centres of vegetation, and existing independently." This theory seems to us in every respect more cumbrous and less probable than the theory of evolution. It is wanting in that unity and simplicity which commend this latter view of the origin of existing forms of life so strongly; it can at all events not claim to have any more solid foundation of observed facts to rest upon; and it is open to the obvious objection that it is an elastic theory, capable of indefinite modification as our knowledge of facts increases. With each fresh geographical or phyto-logical discovery, the advocate of this hypothesis would be ready to shift his "centres of creation" to any extent. The

tendency of scientific thought has inclined of late years strongly in the direction of extending to the whole realm of nature the "uniformitarian" explanation of which Sir Charles Lyell is so distinguished an advocate in geology. It is more in accordance with sound reasoning, it is more consonant with our increasing knowledge of natural phenomena, to believe that the state of things which existed in any past geological epoch was the result of an accumulation, prolonged through an indefinite series of years, of the same causes which we now see operating around us on every side, than that it was produced by convulsions or "cataclysms." The production of Grisebach's "centres of vegetation" would seem to require as violent an interruption of the ordinary laws of nature as the separate creation—according to the Linnean aphorism, *Species tot numeramus quot diversae formae in principio sunt creatae*—of all species as they now exist. Nor does our author offer any hypothesis as to the mode in which the dissemination of the earliest germs (*Ausstreung der ersten Keime*) took place, or how the germs themselves were produced. It is singular, too, how all opponents of the theory of evolution are compelled constantly to make use of phrases—"relationship," "affinity," and so forth—which would appear to the unlearned reader to admit the truth of the doctrine which they are contesting.

We might urge further objections against Prof. Grisebach's theoretical deductions: but these form after all but a very small portion of the work under review. It is a more grateful task to express once more our sense of the eminent service he has rendered to science by the patient and laborious accumulation of this vast store of facts relating to one of the most interesting subjects which can engage the attention of the philosophic student of natural history.

ALFRED W. BENNETT.

### Notes of Discoveries and Scientific Work.

#### Geology.

**New Cretaceous Birds of North America.**—Amongst the many objects of interest brought by the Yale College expedition from Western Kansas are the remains of several species of fossil birds in perfect preservation. An examination of this remarkable find has shown that they represent gigantic swimming birds, probably having their nearest living allies in the *Colymbidae*, but differing widely in many respects from the members of that group. O. C. Marsh, in the *Amer. Jour. of Science* for May, 360, proposes the name of *Hesperornis regalis* for this new bird.

**Elephant Remains in Colorado.**—In the coarse sand and gravel beds of the Arkansas river in Colorado remains of *Elephas americanus* are not rare. About a year ago two teeth and some bones of this species were found, and quite recently a large tusk, probably of the same species, was disinterred from the same deposit. (*Amer. Jour. of Science*, April, 302, and May, 373.)

**The Loess in China.**—Baron von Richthofen, who has travelled through a great part of China during the last few years, examined the extensive deposits of loess in the province of Shensi, which in some districts attain a thickness of from two to three thousand feet. They are not confined to the great valleys or river basins, but form the slopes of mountains, cap the tops of hills, and in fact cover a considerable portion of the province. This deposit, consisting chiefly of sand and silt with occasionally marly nodules, does not show the slightest sign of stratification, and the few land shells it contains are not rolled. Von Richthofen is not disposed to attribute the deposit to any agency of water or ice, but shows it to be the result of a subaerial action, which up to this epoch was one of the most energetic agencies influencing the contour of this portion of the globe. (*Verh. d. geol. Reichsanstalt*, 1872, No. 8, 156.)

**Plant Remains in the Permian Beds of Bohemia.**—Eighteen years ago C. von Ettingshausen described the occurrence of remains of plants in the anthracite-bearing shale of Budweis, in Bohemia, and compared them with the flora of the Alpine anthracite formation, which were believed to be true coal measures. D. Stur has published (*Verhandl. d. geol. Reichsanstalt*, 1872, No. 8, 165) the results of his recent researches on the floras of this locality, and of several others in

Bohemia, Moravia, and the Alps. It appears now placed beyond doubt that this abundant flora is of Permian age, and that the flora of Budweis especially belongs most probably to the "rothliegende" (lower Permian). Of the numerous species may be mentioned *Alatopteris conferta*, *Walchia piniformis*, *Odontopteris obtusa*, and *Neuropteris cordata*. It is of interest to note that the beds in which this flora occurs contains in Bohemia anthracite beds and in Moravia graphite.

**The Coal Measures of Carinthia.**—According to E. Tietze (*Verhandl. d. geol. Reichsanst.* 1872, No. 7, 142) the group of shales, limestones, and conglomerates, usually called the Gailthal beds, in Carinthia, and generally supposed to be carboniferous, represent in part only strata of the age of English and Silesian coal measures, the rest being of a higher horizon. It appears that in the mountains north of Pontafel the whole of the Carboniferous series is represented. The occurrence of *Productus giganteus* indicates the Lower Mountain Limestone series; and by the presence of *Littorina obscura* the lower portion of the coal measures is detected, whilst the occurrence of *Fusulinae* with plant remains determines the upper coal measures. Tietze's observations render it highly probable that the series of conglomerates, shales, and limestones resting on the Carboniferous beds belong to a higher horizon, and cannot rightly be included with what are termed Gailthal beds.

**A New Crab from the Vienna Basin.**—This new form, which was found in the Leitha limestone of the Tertiary basin of Vienna, is placed by A. E. v. Reuss near *Actæon* and the living *Daira varcolosa*, but from several peculiarities of proportions and configuration has been made the representative of a new genus, and been termed *Phymatocarcinus speciosus*, Rss. (*Sitzungsber. d. k. Akad. d. Wiss.* lxiii. April 1872.)

**The Geology of Queensland.**—At the meeting of the Geological Society of London on 24th April, R. Daintree read a paper describing the Geology of Queensland. After directing attention to the scanty alluvium of Queensland with the great extinct fauna of mammalia and the so-called Desert Sandstone, which rests unconformably on Cretaceous beds, the author described the various deposits assigned to the Mesozoic epoch. Mr. Daintree supposes that, contemporaneously with the deposition of a series of marine beds to the west of the great dividing range of hills during the Oolitic and part of the Cretaceous period, a vast lacustrine deposit was accumulated over a large area to the eastward of the range, to which the sea subsequently obtained access. Among the Palaeozoic rocks, the author detects Carboniferous and Devonian strata; the former is represented in Northern Queensland by an extensive coalfield. Devonian rocks extend from 18° S. to the southern boundary of Queensland, and for 200 miles inland. They consist of slates, sandstones, and coral limestones. The upper portion of this series contains an abundance of fossil plants, and of the deposits containing them, those at Mount Wyatt are interstratified with beds containing *Spiriferæ*. Gold is found in many parts over the Devonian area, and the author entered in considerable detail into its mode of occurrence there. Metamorphic rocks occur in various localities; and the connection between the presence of certain Trap rocks in these Metamorphic areas and in the Devonian area and the production of auriferous and cupriferous lodes was traced. The volcanic rocks, the author believes, have played a most important part in determining the elevation and present physical contour of North-eastern Queensland; they follow the line of greatest elevation on the main watershed at altitudes of from 1500 to 2000 feet above the sea-level.

**Squalorais polyspondyla from the Lias.**—In the *Geological Magazine*, April, W. Davies describes the rostral prolongations of this singular Liassic fish. The two projecting processes from the snout of this fish were regarded by Dr. Riley and Prof. Agassiz as forming a single rostrum; but the author maintains that the upper one is really a cephalic spine analogous to that met with and similarly placed in the male *Chimaeridae*, and that it was employed, as by them, in conjunction with the elongated rostrum for securely clasping the female. Mr. Davies refers to other characters in the anatomy of this curious fish, of which he gives an illustration.

**The Quaternary of Sullivan Co.** consists, in descending order, of blue and grey clays irregularly stratified with coarse and fine gravel; below these, the same clays with coarse gravel and boulders of granite, gneiss, quartzite, porphyry, with a small quantity of gold, copper, lead ore, magnetite, and garnet; and, under these again, blue and white plastic clay two to five feet thick. The stratified loess, considered to be next in time, contains at Fort Azatcal near Merom, a number of land shells, all of which are identical with existing species now met with in the State, with the exception of *Helix occulta*, which has not been found alive north of Arkansas. (*Second Report of the Geological Survey of Indiana*, 1870, by E. T. Cox; Indianapolis, 1871.)

#### Physiology.

**The Action of Pepsin on Blood Fibrin.**—In the last part of *Pflüger's Archiv*, Band v. Heft 8, is a long paper by v. Wittich on the ferments affecting the digestion of the fibrin of blood. The digestive fluid he employed was always the fresh glycerine extract of the minced

stomach of the pig, or some other animal; the fibrin used was that of blood which had been immersed in a considerable quantity of a 0.2 per cent. of hydrochloric acid. He concludes from his experiments that fibrin absorbs pepsin very energetically, but that the process of digestion commences with chemical combination, though perhaps of comparatively little stability, of the pepsin with the acid, and that this compound is the really active material. A series of researches undertaken to ascertain the effect of temperature showed that even with a considerable degree of cooling (to below 40° F.) the process of digestion is not entirely arrested, whilst it proceeds with the greatest rapidity at temperatures between 95° and 112° F.; higher temperatures than these appear to retard the action. V. Wittich also finds that for the digestion of a given amount of fibrin definite quantities both of acid and pepsin are requisite; the presence of water is also an essential condition. He maintains that Meissner's *parapeptones metapeptones*, &c. are to be regarded as representing the initiatory stages of the action of the pepsin-containing fluid on the fibrin, and that they are converted into peptone as the action proceeds, though, if the amount of pepsin present be insufficient, they may remain unaltered, the entire process, in fact, being analogous to the change of alcohol into ether by means of sulphuric acid.

**Causes of Variation in the Amount of the Gases contained in the Blood.**—Drs. Mathieu and Urbain, in a paper contained in the May number of Brown-Séquard's *Archives de Physiologie*, state that they have been able to establish the accuracy of the law, "that in animals maintaining a constant temperature, the quantity of oxygen absorbed by the blood varies inversely with the temperature of the air that they respire." In other words, the amount of oxygen that circulates in the arteries of a vertebrate animal with warm blood is greater when it is exposed to cold, and less when exposed to warmth; and, as a consequence, all the processes of organic combustion are rendered more active under the former condition, while they are retarded under the latter. They further show that under diminished pressure there is diminished absorption both of oxygen and of carbonic acid by the blood, and *vice versa*.

**The Physiological Value of Alcohol as a Food.**—Liebig, it is well known, regarded alcohol as a food, and classed it with sugar, starch, and fat, referring in support of his view to the large amount of carbon it contains, the facility with which it can be oxidized outside the body, and the disposition to fatten observed in those who, though they consumed little food, take much alcohol. During the last few years, however, considerable differences of opinion have arisen in regard to the correctness of these views, chiefly in consequence of the statements of Lallemand-Perrin and Duroy to the effect that whatever alcohol is ingested into the system is absorbed into the blood in an unaltered state, and after traversing the system is sooner or later eliminated by one or other of the excretory organs. This statement has been strongly opposed by the majority of English observers, as by Dupré, Parkes and Wallowicz, and Anstie. The question has again been raised by v. Subbotin, who gives an account of his investigations in the last part of the *Zeitschrift für Biologie*, Band vii. Heft 4. He experimented with rabbits, and after injecting some alcohol of the strength of 29 per cent. into their stomachs, carefully analysed the excretions of the bowels, lungs, skin, and kidneys, with an apparatus placed at his disposal by Prof. Voit. The amount of alcohol eliminated was determined by an indirect method: the alcohol was converted into acetic acid by the action of chromic acid, or of bichromate of potash and sulphuric acid, and after distillation the quantity of acid was easily ascertained. His results indicate that during the first five hours after the introduction of alcohol into the animal organism a by no means inconsiderable proportion is again eliminated by the skin, lungs, and kidneys; that at least twice as much alcohol passes off by the lungs and skin as by the kidneys; while, lastly, numerous considerations showed that his experiments did not show the entire amount of alcohol eliminated. He satisfied himself that in the course of twenty-four hours after alcohol has been introduced into the stomach of a rabbit at least 16 per cent. of it is eliminated either in the form of alcohol or of aldehyde. Dr. Subbotin contends that though alcohol is not a nutriment, it resembles arsenic in diminishing the disintegration of the tissues, and in this way may lead to fattening.

**Effects of Extension of the Nerves on their Irritability.**—G. Schleich, in the *Zeitschrift für Biologie*, Band vii. Heft 4, records a considerable series of experiments made with the object of determining the effect on their excitability by stretching nerves with various weights, and states that moderate extension of the nerves of the frog, the extending weight being about 40 grammes, causes no material diminution of its excitability; when, however, the weight exceeded this amount, the excitability rapidly diminished. In some instances, slight extension seemed to augment the excitability of the nerve. Muscular contractions were often observed when the extending weight exceeded 30 grammes.

**Development of the Lens of the Eye.**—D. Sernoff (*Russische kriegsärztliche Zeitschrift*, 1871, and *Medicinisches Centralblatt*, 30th March, 1872) has undertaken a series of researches to determine the

correctness of Kölliker's view that the lens of the eye is a product of the multiplication and modification of the epithelial elements. He pursued his researches on the fowl because in this animal, according to the concurrent testimony of Haller, Baer, and Henle, no *membrana pupillaris* is formed; the presence of that membrane in mammals might readily justify the belief that the capsule of the lens was derived from connective tissue, of which the *membrana pupillaris* consists. He began his observations on the second day of incubation. At this period an inversion begins to appear in the epiblast for the formation of the lens, but there is no opening in the mesoblast, and the lens is not in immediate contact with the eye-vesicle, as Remak maintains, but is separated from it by a lamina of the mesoblast (connective tissue). This lamina also becomes inverted into the cavity of the secondary eye-vesicle with the lens. At the lower border of the eye-vesicle is a thickening of this lamina, which fills it, and was formerly known as Schöler's inversion of the vitreous. On the third day, when the lens is already constricted off, the above mentioned lamina of connective tissue closes over it, and forms the temporary capsule of the lens. This was seen, but incorrectly interpreted by Remak. It is not structureless, as he states, but contains scattered nuclei, and exhibits a slightly fibrous structure. From the posterior half of the temporary capsule of the lens are formed successively: *a*, the vitreous, owing to a growth of the tissue on the third day; *b*, the posterior half of the capsule of the lens (a layer of connective tissue covering the posterior surface of the lens begins to thicken, and the nuclei originally present gradually disappear, leaving it structureless; this takes place about the fifth or sixth day); *c*, the *Zonula Zinnii* (aided by *a*'s condensation of a portion of the vitreous which is situated in the space between the aequator of the lens and the *corpus ciliare*; this occurs between the eleventh and fifteenth days). From the anterior part of the temporary capsule is formed: *a*, the cornea; and *b*, the anterior half of the capsule of the lens with the anterior chamber between the two, owing to fission of the temporary capsule into two laminae on the fifth day. There then develops on the posterior surface of the cornea an endothelium from connective tissue cells, which proceed from the substance of the cranial laminae. From the peripheric parts of the anterior half of the temporary capsule the iris grows, which is at first united by its pupillary border with the capsule, but afterwards, on the tenth day, becomes free. The border of the eye-vesicle now projects towards the posterior surface of the iris; from its external layer is developed the posterior pigment layer of the iris, and from its inner the so-called *membrana pigmenti*. It appears, then, that in birds the capsule of the lens is developed from an inversion of the same connective tissue from which Kölliker considered the *membrana pupillaris* to develop in mammals. Sernoff thinks that in mammals both the *membrana pupillaris* and the capsule of the lens are developed from Kölliker's lamina of connective tissue.

### Chemistry.

**The Transformation Products of Starch.**—A paper on this subject was read before the Chemical Society on the 16th May by C. P. O'Sullivan. He finds that, if malt-extract be added to starch paste at 50° C., disorganization immediately commences, and the solution develops a blue colour with iodine. After the lapse of a few minutes, it colours iodine no longer blue, but dark reddish-brown. A few minutes later iodine ceases to strike a colour in the filtrate from the cooled solution. If the digestion be continued, a point is reached when the change is complete. The substance then in solution has a specific rotatory power  $[\alpha] = +150^\circ$ , or nearly, and gives a reduction of cupric salts corresponding with 65 per cent. glucose; and although the digestion be continued for a considerable time, there is no increase in the amount of reduction. The three substances—soluble starch coloured blue by iodine, dextrin coloured dark reddish-brown by iodine, and dextrin not coloured by iodine—when dried at 100° in a current of dry air, have the composition  $C_6H_{10}O_5$ , and the same specific rotatory power,  $[\alpha] = +213^\circ$ . The numbers usually given for the rotatory power of dextrin,  $+138^\circ$  to  $+68^\circ$  (Béchamp makes it  $+176^\circ$ ), are incorrect, the substances employed for the determination having been a mixture of dextrin and sugar, and not pure dextrin. The final product of the transformation of starch by the action of diastase is a sugar having the same composition as cane-sugar and lactose,  $C_{12}H_{22}O_{11}$ . Its rotatory power is little more than twice that of the former sugar,  $[\alpha] = +150^\circ$  ( $+74^\circ \times 2 = +148^\circ$ ); and it reduces very nearly the same quantity of cupric salt as the latter. Maltose, as the new sugar has been named, reduces only two-thirds as much cupric salt as glucose; lactose reduces seven-tenths as much. The new sugar has not yet been obtained in a crystallized condition; there is reason however to believe that it will be so.

**The Influence of Pressure on Fermentation.**—At the meeting of the Chemical Society, on the 16th May, a paper on this subject was read by H. T. Brown. The author found that during alcoholic fermentation other gases besides carbonic anhydride are invariably given off. When malt worts ferment, he finds the gas unabsorbed by potash to

be about  $\frac{1}{100}$  of the total gas evolved, and to have the percentage composition:—

Nitrogen	98.15
Hydrogen	1.85
$C_2H_4$	1.67
Nitric oxide	1.33
	100.00

The nitric oxide is traced to the nitrates of the fermenting liquid, the nitrogen to the decomposition of albuminoids. When fermentation takes place under reduced atmospheric pressure, the proportion of evolved gas not absorbed by potash is found to be considerably augmented, the increase being mainly due to hydrogen; and the oxidation products, acetic acid and aldehyde, are likewise more abundant in the fermented liquid. The author considers that water is decomposed during fermentation, dissociation of the water molecule being favoured by decrease of atmospheric pressure.

To celebrate the fourth centenary of the birth of Copernicus, which falls on the 19th of February, 1873, the committee of the *Copernicus-Verein für Wissenschaft und Kunst*, established at Thorn, his native town, contemplate preparing a new edition of the *De Revolutionibus Orbium Coelestium*. It is to be an exact reprint of the first and memorable Nuremberg edition of 1543 as regards form and arrangement; and the text will be revised with the help of the original manuscript, which is still in the possession of the Graf von Nostitz-Rieneck. Persons desirous to subscribe for a copy, the cost of which will be one pound, are to make application to the committee before the 1st of June. The reprint is expected to be ready for distribution in January next year.

### Philology.

Al-Harîrî's *Durrat-alghawwâs*. [Pearl of the Diver.] Herausgegeben von Dr. H. Thorbecke. Leipzig: Vogel, 1871.

VERY few authors of the East are as well known in Europe as Al-Harîrî. He was first introduced into our literature by Friedrich Rückert, who equalled him in the mastership of his native tongue. Of late he has been rendered accessible to the English reader by Mr. Chenery's translation. His *Makâmât* or "Sessions" are the most perfect specimens of rhetorical art in Arabic. Although he was not the first who practised it, his "Sessions" may fairly be considered as the foundation of this sort of literature not only in Arabic, but also in Persian, Turkish, and Hindustani. His influence is less remarkable from the fact that numerous writers tried to imitate him, than it is by the fact that he has thoroughly

altered, not to say infected, the style of all prose-writers ever since. Their chief object was not to express an idea, but to write brilliantly. Whilst in Hariri there is still a rational proportion between form and sense, after him the former has got the preponderance, encroaching upon, and in many cases altogether absorbing the latter. Hariri is the father of the bombastic phrase which has killed the spirit in literature.

Hariri was also a philologist. Being as a stylist the starting point of a literary movement, he stands in his quality of a grammarian in the *arrière-garde* of a great period, having no claim to original merits, but distinguished, if at all, by subtleties of minute importance. Arabian philology was started about the middle of the second century of the Hejra; it culminated in the third and fourth centuries, and *præter propter*, A. H. 400, may be considered as the end of originality in this branch. Then begins the period of reproducing, rearranging, and collecting. People wished to supersede and antiquate the older works by compilations of them, and we must lament that their endeavours have been crowned with so much success.

The book, edited by Dr. Thorbecke, was composed with the object of preventing educated people from making blunders of any kind, mistakes in forms, words, and construction. Only the language of Koran, Hadith, and the ancient poets is classical; anything deviating from their usage is a vulgarism. Without any apparent order the author quotes those faulty expressions, adds his corrections, and tries to prove and to illustrate them from the just mentioned sources. The *Durrat-alghawwās* (that is, "Pearl of the Diver") is very well written, and more readable than books of this kind generally are. To the main work are appended two chapters, one on synonymics and another on wrong modes of spelling.

Naturally the subject of Hariri's puristic corrections has quite a different interest for us. What to him is vulgarism, is mainly the organic development of the language. The Arabic of literature has remained unchanged from the times before Muhammad till the present. It is supposed originally to have been spoken, pure and unmixed, by the tribe Kuraish, but as early as the second century people consult indiscriminately the Bedouins as those who spoke the purest language, no regard being had to what tribe they belonged and from which part of the country they came. Immediately after the first expansion of Islām the Arabs were greatly mixed with foreign elements in the towns. The dialect of common life began in many points to diverge from the rules of the classical language, less in consequence of the intercourse with foreigners than because the Arabic, like all other languages, had to run its course of organic development; *i. e.* deterioration, which progresses particularly rapidly in those times, when radical changes in the life of the nation are taking place. Even the very early grammarians observed this fact and tried to contend against it. To this misunderstood zeal we owe a small literature on the slang of those times, very valuable in so far as it furnishes us the connecting link between the dialects, spoken in our time, and the classical language. There is a great gulf between the two; to fill it up is one of the problems of modern Arabic philology. The means by which this may be effected are twofold; the works of ancient grammarians on slang and works written in dialect, which do not go much further back than the fourteenth century of our era. When these sources shall have been utilized, it will be time for somebody to try to write a history of the Arabic language; though a great many difficulties will still remain to be solved by his own conjectures. The comparative grammar of all Semitic dialects will also derive much light from the same source.

Regarding the individual merit of Hariri's work on slang we cannot form a very high opinion. The first books of this kind were composed three centuries before him, and ever since this branch of literature had been cultivated. From the materials amassed by his predecessors he has made a rather poor compilation. From a close comparison of the *Durra* with its sources it will, no doubt, be made out that very little original merit is due to him, and that the words in his preface, "And look! I have deposited in it (the *Durra*) all the pith and marrow of choice observations and subtle remarks, which are not to be found in the context of any book" are more grandiloquent than true. It seems, for instance, that the logical and stylistic observations are his own, whilst everything else had already been much more amply treated by others. He seems chiefly indebted to Al'aṣma'ī, Tha'lab, and Ibn Kutaiba. It has frequently been the case in Arabic literature, that late compilations have been printed instead of their much more valuable sources. Although we are not of opinion that a book, simply because it is older than another of the same contents, must therefore be more valuable, still we must state that experience has led us to observe that (in the period of reproduction) the compilers, however careful and diligent they may seem, almost never have exhausted their sources to such an extent and in such a manner as to render the originals superfluous for us. Al'aṣma'ī has been used by later authors more than anybody else, and still his treatises contain many observations which none of his compilers seems to have thought worth while transcribing. It is not our intention to reproach the editor for having chosen the *Durra*, but what we lay stress upon is this, that the sources of the *Durra* are much more valuable than the *Durra* itself; and that, in order thoroughly to utilize this literature on slang, it will be necessary to investigate the works of the predecessors of Hariri.

Silvestre de Sacy first directed the attention of scholars to the *Durra*, and edited about one third of the whole in his *Anthologie grammaticale*. Since it has been edited at Bülak, A. H. 1273 (1856). The edition of Dr. Thorbecke is based upon the Gotha manuscript, which was copied within a century after Hariri's death (A. H. 516). Besides he has derived much help and useful information from the commentary of Alkhafājī. The editor has carefully instructed the text with vowel and diacritical points; he has also added various readings under the text and a complete index of words and names. Dr. Thorbecke, well-versed in researches of this kind for years past, has a complete command of the language as well as of the subject, and he has produced a book which is sure to win him the gratitude of all fellow-students. In the preface he has added explanations and corrections. Those mistakes which had eluded the attention of the editor himself, have been corrected by Prof. Fleischer.

It is a great pity that, for reasons which cannot be the subject of scientific criticism, Dr. Thorbecke was prevented from giving a complete commentary of his own. Let us hope that another time circumstances will be more favourable to him and to us.

ED. SACHAU.

A Grammar of the Japanese Written Language; with a Short Chrestomathy. By W. G. Aston, M.A.

THE want of such a work as the one before us has long been urgently felt by students of Japanese. The study of a language so far removed in its structure from the European linguistic families must at all times be attended with difficulty, even when trustworthy dictionaries and grammars are ready at hand; how much the more then when each student has been compelled to find his own way through the almost untrodden field of Japanese grammar? Possessed with a

keenest taste for scientific enquiry than the Chinese, Japanese scholars have devoted considerable attention to the construction of their language, and numerous treatises on the subject have appeared within the last century. In the work before us, Mr. Aston has embodied the results of a careful study of the most noteworthy of these, and has arranged the information he has thus acquired in an able and scholarly manner.

In common with the Altaic family of languages, Japanese is an agglutinative language, "that is to say, the roots of words suffer no change, and the results which are obtained in European languages by inflection are arrived at in Japanese by the use of separate particles suffixed to the root." With Chinese it has no connection, beyond the fact that at different periods numerous Chinese words have been imported into the language, but these have in no wise affected its essentially Altaic character. The original written language of Japan was alphabetical, and was introduced into that country from Corea, where a similar character is to this day employed; but when, during the sixth century, the study of Chinese, stimulated by the promulgation of Buddhism, became general throughout Japan, Chinese characters were adopted, as affording means for a greater latitude of expression. At the present day these may be read in four different ways. In some cases they possess the value of Chinese words, and in others they serve as equivalents of synonymous Japanese words. Again they sometimes represent the mere sound of Chinese words, and at others the sounds of Japanese syllables. When used in either of the two first capacities, they are described by native writers as *Mana*, or "direct names," and when in either of the latter ways, as *Kana*, or "borrowed names." As may readily be imagined, when literature became more highly cultivated, the difficulty of rendering by *Mana* the native modes of expression and poetical terminations became so great that a more extended use of Chinese characters, in their capacity as mere phonetic signs, came into vogue. The want of system, however, which at first attended their employment in this capacity gave rise to such confusion that it became necessary to adopt "alphabets, or rather syllabaries, known as the Katakana, or (Yamatokana), and Hiragana, or (Idzumo-gana)." Both these alphabets consist of forty-seven syllables, which, in the case of the former, are represented by abbreviated forms of Chinese characters, one side (*Kata*), or "a part," being taken to represent the entire character; while the Hiragana syllabary "is nothing more than abbreviated cursive forms of a limited number of the more common Chinese characters." In the latter syllabary each syllable is represented by several characters, so that the entire number of signs amounts to several hundred.

In modern Japanese writing the three forms of characters, namely, the *Mana*, the *Katakana*, and the *Hiragana*, are invariably used together, thus adding a further entanglement to a language already sufficiently complicated. The difficulty of determining whether the Chinese characters in a sentence should be read as *Mana* or *Kana* is often very great, and is overcome only by the instinct which is the result of proficiency, while the various forms employed in the *Hiragana* are distinguishable only after long and careful practice. The native grammarians divide the words of the language into three classes, namely, *Na*, literally "name," and including the parts of speech known in European grammars as noun, pronoun, and numeral adjective; *Kotoba*, "word," comprising verbs and adjectives; and *Teniwoha*, a word formed of four of the most common particles, viz. *te*, *ni*, *wo*, and *ha*, under which class are grouped the article and prepositions, together with the terminations of verbs and adjectives. This classification Mr. Aston has accepted as according well with the structure of the language, with this

difference only, that he subdivides the *Teniwoha* into two classes, uninflected subordinate words and inflected subordinate words. It must be understood that the uses of inflection in Japanese are in no way analogous to its functions in European languages. It has nothing to do with voice, mood, tense, person, gender, number, or case. Its principal office "is to give to the same root the force of a different part of speech, according to the inflection employed." The importance attaching to this use of inflection will be obvious when it is stated that all verbal and adjectival roots have forms in which they appear successively as nouns, adverbs, adjectives, and verbs. "Mood and tense are indicated by *Teniwoha*, or suffixes; person is only occasionally and indirectly intimated by the use of honorific or humble particles; gender is denoted by compounds similar to the English words 'he-ass,' 'she-ass,' and number and case are expressed, if at all, by suffixes or particles distinct from the noun." In common with all languages of the Altaic family, every word in a Japanese sentence which serves to define another word invariably precedes it. "Thus the adjective precedes the noun, the adverb the verb, the genitive the word which governs it, the objective case the verb, and the word governed by a preposition the preposition."

Such are, briefly stated, the leading features of the Japanese language. Through its more minute intricacies we have not space to follow Mr. Aston. On the subject of these we must refer our readers to his book itself, which, if carefully studied, cannot fail to prove a sure guide to an accurate knowledge of the language.

ROBERT K. DOUGLAS.

A Dictionary of English Etymology. By H. Wedgwood, M.A. Second Edition. Trübner, 1871-2.

MR. WEDGWOOD evidently belongs to the "old school" of Philology. The two main principles of all systematic etymology—(1) that before comparing two words, they must be traced back to their oldest forms; and (2) that every change of form must be justified by a reference to the known laws of sound change in the language or languages in question—are persistently ignored by him. His method is simply to take a word in modern English, and without troubling himself to ascertain its previous history, to set it down as imitative of the idea it represents, supporting his position with parallels drawn at random from the modern Teutonic or Slavonic languages. "The analogy between sound and movement is nowhere better illustrated than in the origin of *quick*. The radical image is a quivering sound, the representation of which is used to signify a quivering movement, and thence applied to express the idea of life as the principle of movement." He then proceeds to identify it with the German *quick*! "used interjectionally to express a sharp, shrill sound, as the squeak of a pig." This is extremely plausible, but if we trace back the word *quick* through the Gothic *kvius* to the original *giwas*, from the root *giw* = "live" (Latin *vivere*, Greek *bios*), the whole edifice falls to the ground. Mr. Wedgwood then quotes the Danish form *qvæg* and the compound *qvægsand*, of which he says that it unites *quick* with *qvæg* (in *qvægmire*), in apparent ignorance of the fact that the change of final *k* into *g* is a regular law in modern Danish, and therefore that his comparison of English *qvæg* with Danish *qvæg* is as groundless as his connecting *whole* and *hale* with Greek *hólos*—a blunder from which the study of so well-known a work as Professor Müller's *Lectures* might have saved him—and English *bad* with the German *böse*! But Mr. Wedgwood's sins against Grimm's Law are but a small tithe of his offences. Let us test him in the Romance languages. Under *mouse* he says,

"it is singular that the name of so familiar an animal should not have been retained in the Romance languages." It is clear that the reading of Diez's *Grammatik* did not form part of his philological programme, else he could hardly have missed the law so clearly laid down by Diez that all Latin monosyllabic words disappear in the Romance languages, and are replaced by dis- and polysyllabic formations.

The unsoundness of his general principles is only equalled by his inaccuracy of detail. A sound knowledge of the oldest English or Anglo-Saxon is surely an indispensable requisite for an English etymologist, yet even here we find such blunders as *bence* for *benc*, *laferc* for *lawerce*, *hrecsan* identified with *risan*, &c. In many cases the Old English form is omitted altogether in favour of the corresponding Icelandic words, with which Mr. Wedgwood makes equally wild work. His Dutch words seem to be chiefly taken from the old dictionary of Kilian, and it will seem hardly credible that he is misled by the old *u* for *v* in *augeaen* (modern *afguan*) to identify it with the *w* of *awkward*, but such is the fact. He might as well infer from the Elizabethan spelling *uerie* that Shakespeare said *werry* instead of *very*.

These few examples might be multiplied by the thousand, but enough has been said to prove the general untrustworthiness of the etymological part of the work. We will now turn to the Introduction on the Origin of Language, in which Mr. Wedgwood zealously defends the imitative theory. Here, again, his conclusions are generally of little value through his utter want of method and scientific training, yet he has collected a large number of interesting facts, and his criticisms on the mysticism of German philologists, especially on the "ding-dong" theory advanced by Professor Müller, are sound enough. But it is easier to pull down than to reconstruct, and we cannot see that he has done anything to prove the general applicability of his own theory. He has only given a large number of examples, many of which can be disproved by the simple process of tracing them back to an older form. Others, again, such as *cuckoo* and *cock*, are, as Professor Müller has well said, "dead sticks in a living hedge," which by mere accident have displaced the older *geac* and *hana*.

The insuperable obstacles, both phonetic and psychological, there are to the general application of the imitation principle have not been sufficiently weighed by Mr. Wedgwood. If we trace the sounds of the Aryan languages back to their oldest forms, we cannot fail to observe a general tendency to simplification both in the number of simple sounds and the extent to which they are combined with one another. It is certain that in the original Aryan language there were only *ten* simple consonants, *g, d, b, k, t, p, n, m, s, r*, with a correspondingly limited number of compounds. Indeed every analogy leads us to suppose that in a still earlier stage of the language there were no consonant groups at all, and that every consonant was necessarily followed by a vowel. It is evident that under these circumstances the range of the imitative principle must have been very limited. And it must be borne in mind that even the pre-historic Aryan root-words registered in such a work as Fick's *Indo-Germanisches Wörterbuch* are comparatively modern in form, and consequently that, even if a large number of these roots could be explained on the imitative principle, there would be no certainty of the same explanation holding good of the same roots in an earlier form. The second objection is that the most primitive and indispensable words of language are just those which could not possibly have originated directly from imitation: the first object of language must have been to make known the most pressing material wants, such as hunger and thirst, not to call attention to the song of the nightingale, or discuss the ornithology of the cuckoo.

Towards the end of his essay, Mr. Wedgwood wanders off to the interjectional theory, which he somehow contrives to mix up with the principle of imitation. He says that when a Greek expressed surprise with *babai*, he was *imitating* an instinctive interjection, whereas the truth is that there is no imitation at all in the matter; it is the sound, the interjection itself, which is used to express the idea. When Mr. Wedgwood comes to *papa* and *mamma*, he quotes with approval the explanation of La Condamine, that "they are the first that children can articulate, and consequently those which must in every country have been adopted by the parents who heard them spoken." This is probably correct, but what has it to do with imitation or even with interjection? What natural sounds do the words imitate, or what emotions do they express? None, at least, that Mr. Wedgwood can point out. All this is at the best mere beating about the bush: nursery jargon and imitation run alongside of language proper, but without influencing it appreciably; where language begins, they leave off. The large number of imitative bird-names in savage languages asserted by Mr. Wedgwood is exactly paralleled by their great use of gesture (some tribes of American Indians, it is said, cannot carry on a conversation in the dark), but as language increases in copiousness and precision, the imitation and gesture words drop out, and are replaced by legitimate non-imitative words, founded on some definite function or attribute of the thing named, not on a mere accident of sound.

Before parting from Mr. Wedgwood, we cannot but express our regret that he has not taken more trouble to familiarise himself with the leading principles of philological investigation: a few months at any good comparative grammar might have saved him from nearly all the serious errors he has fallen into, and enabled him to turn his extensive reading to a really profitable account.

HENRY SWEET.

### Intelligence.

Has Vergil already become one of the great forgotten? Somehow or other this trivial question is one very likely to suggest itself to most readers of a recent article by that acute scholar, Herr Lucian Müller, the well-known author of the treatise, *De Re Metrica*, and editor of we know not how many of the Latin poets. In the current number of the *Rheinisches Museum* he seizes the opportunity of showing up certain errors of Gaisford in his edition of the *Scriptores Latini Rei Metricae*. One of these writers on metre, Marius Plotius, gives the following as an instance of an hexameter with dactyls in the second and fifth places in the verse:—

"Contemplator item, cum se nux plurima silvis."

So runs the line in Gaisford's text; Herr Müller, however, decides that Gaisford is wrong here, and tells us we must read not *nux*, but *nox*, on the ground that the line is a "manifest imitation" of the Lucretian

"Contemplator enim, cum solis lumina cumque  
Inserti fundunt radii per opaca domorum."

We can only suppose that Gaisford, in blissful ignorance of literature, imagined Plotius to be quoting from the familiar place in the *Georgics*:

"Contemplator item, cum se nux plurima silvis  
Induct in florem, et ramos curvabit olentis"—

in which case, in spite of our insular prejudices in his favour, we rejoice to see him receive the castigation he so clearly deserves.

In the *Abhandlungen* of the Royal Academy of Berlin, Professor Weber has lately printed the *Pratijnāshtram*, a phonetic treatise belonging to the white Yajurveda, with a German translation and a commentary written by Rāmaśarman, in the beginning of the present century. This little manual consists of twenty-seven rules, partly treating of the accents used by the Mādhyaṇdina school in reciting their Veda, and partly on modifications of the original pronunciation of certain letters, which in course of time had crept in in private Veda reading. Several of these rules are very interesting, showing as they do some of the modifications which the original Sanskrit sounds had already undergone in the common language at the time these rules were framed. To this treatise Professor Weber adds a passage from the *Yājñavalkya-sikshā* on the representation of the various letters by means of certain signs made by the fingers; and some remarks on the symbolical employment of the fingers in Hindu life and literature. He also communicates,

in two appendices, a fragment of the *Pratijñāparīkṣā*, a supplement to the same Veda, enumerating its schools and the subjects treated in its *Sanhitā*; and an analysis of the *Maṇḍūkā-śikṣā*, another phonetic treatise, of which a MS. has been presented to the Berlin library by Dr. Bühler, of Bombay.

In the monthly *Proceedings* of the Berlin Academy for February, another paper by Professor Weber is published, containing an interesting account of the Indian game of chess, according to a detailed description given of it in the first book, or *Tithitattva*, of Raghunādana's great *Digest of Hindu Law*, which, according to Dr. Bühler, was compiled in the beginning of the sixteenth century. It is well known that the game is mentioned as having originated in India, by Arabic writers as well as by Firdusi, who in the *Shah Nameh* states that it was introduced at the courts of the Sassanian king Nushirvan (A.D. 529-577) by a Hindu, who acted as the ambassador of the king of Canouj. The Sanskrit name of the game is *chaturanga*, originally an expression for the fourfold disposition of an army in foot, horse, cars, and elephants. The late Mr. Bland, in a paper published in the *Journal of the Royal Asiatic Society* for 1852, gave a full and highly interesting account of the various modes of the game and the legends regarding its origin, drawn from various Persian and Arabic MSS.; and on the authority of some of these legends, and the assumed Persian origin of the name for the Rook (*rūkh*), he claimed the invention of the game for Persia. Professor Weber now adduces a passage from Halāyudha's *Commentary on Pīṅgala's Chandaśśūtra*, in which *chaturanga* occurs as a name for "chess," and proves it to have been a game well known in India at that time. The writer is generally supposed to have lived before the end of the tenth century.

*Magyar Nyelvőr* (Nos. II. to V.) fully sustains the promise given by the first number which we noticed in the *Academy* for February I (vol. iii. p. 58). Its contents fall into three classes:—First, matter interesting only to students of Hungarian as a living modern language. Such are the corrections of the bad Hungarian found not only in the periodical literature of the country, but also in books written by members of the Hungarian Academy, and even in the great dictionary published under the auspices of that learned body. The mass of Germanisms revealed by the *Nyelvőr* is large enough to make any ordinary patriot despair of maintaining the purity of the language. A large proportion of these foreign idioms originate in the numerous translations, generally from the German, made by "New Magyars" more familiar with the language from which than with that into which they translate. The second class of contents consists of materials for a more extensive knowledge of the folk-lore and popular dialects of the Magyars, every number containing hitherto unpublished songs, proverbs, dialectical vocabularies impartially collected from every district between the frontiers of Styria and those of Moldavia. The third class of subjects treated of does not take up so large a space as the two preceding, though of more general interest to philologists. It consists of examinations of old documents, comparison of cognate languages, &c. throwing light on the growth of the language and the etymology of obscure words. Thus Dr. Budenz explains *egyház*, "church," by an obsolete adjective *egy*, or *igy* = "sacred," of which traces are found in a few names of places, e.g. Hegykő, in German Heiligenstein, in the county of Sopron.

Orientalists generally will endorse Professor Cowell's eloquent protest against the abolition of the chair of Hindu Law in the Calcutta Sanskrit College (see *Times*, April 15). The native editor of the *Hindu Patriot* remarks that "nothing could be more shortsighted . . . That is the one branch of Sanskrit study which is of the greatest practical importance to the country . . . In the Sanskrit College alone is there a chair of Hindu Law, and the venerable Pundit who held it, but whom under the inexorable fifty-five-years rule the Government has lately driven from the service, is the highest authority on the subject. But under the auspices of Mr. George Campbell this only source of Hindu Law is to be shut up."

Mr. Cheyne, of Balliol College, writes to point out that Mr. Poole is in error in supposing (*Academy*, May 15, vol. iii. p. 197) that M. Chabas has given the first explanation of the LXX rendering of Gen. xlvii. 31, ἐστὶ τὸ ἄκρον τῆς ῥάβδου αἰρού, as Dr. Geiger (*Urschrift*, pp. 371, 372) has offered a very similar hypothesis, which at the same time throws light on the Masoretic reading.

We venture to draw the attention of the numerous students of the Greek tragic poets in this country to N. Wecklein's recently published *Studies on Aeschylus* (Berlin, W. Weber), a work which contains a number of very accurate and elaborate investigations concerning Aeschylus' style and diction, a disquisition on the MSS., and detailed discussions of metrical points, with a considerable addition of convincing and many probable conjectures. The same author has also just published a school-edition of the *Prometheus* of Aeschylus (Leipzig, Teubner).

A very remarkable and thoughtful monograph on the ancient silver-mines of Laurium has just appeared, by Aristides K. Oekonomos, ἐν Ἀθήναις, τυπογραφίῳν Θέμιδος.

## Contents of the Journals.

**Rheinisches Museum**, xvii. pt. 2.—A. F. Nāke: On the Theban Tetralogy of Aeschylus. [With a short preface by Ritschl.]—E. Bührens: Critical Notes on the *Panegyrici Valerii*.—K. W. Nitzsch: On the Sources of Herodotus for the History of the Persian Wars. [Shows that Herodotus, in his account of the Persian wars, is not following any previous writers such as Choerilus of Samos, but merely following the popular narratives current in the great houses connected with Pericles at Athens and the royal house at Sparta: just as his earlier narrative depends on the *Adyoi* of Egyptian and Persian priests, &c.]—L. Jeep: On *Claudianus de VI consulatu Honorii*: a contribution to Roman topography. [Discusses the poem as illustrating some points of Roman topography, such as the situation of the Temple of Jupiter Capitolinus and that of the Tarpeian Rock.]—J. M. Stahl: On Thucydides. [Defends the genuineness of Thucyd. iii. 17.]—L. Müller: On Marius Plotius and Nonius.—K. Diltz: Critical Notes on the Greek Anthology.—J. H. Mordtmann: Unpublished Greek Inscriptions. I.—F. Blass: The Poem of Simonides in the *Protagoras* of Plato. [Another reconstruction of the fragments.]—F. Ritschl: On the Literature of Plautus. III. [Draws attention to an extremely interesting letter of Camerarius.]—C. Wachsmuth: *Δορύμνος* and *Δορύμνα*.—K. Lehrs: The Opening of *Odys.* i. and *Odys.* v.—On Plato.—W. Teuffel: On Horace.—*Erotemata philologica*, &c.

**Journal of the Bombay Branch of the Royal Asiatic Society**, vol. ix. No. xxvii.—On some Sanskrit Copper-plates found in the Belgaum Collectorate; by J. F. Fleet. [A Devanāgarī transcription is given of nine copper-plate grants in the Hala Canarese and Kāyastha characters, which contain two different lists of Kādamba princes, hitherto unknown. The writer inclines to the opinion that they preceded Mayūravarmā, who is the first in Sir W. Elliot's *Genealogy of the Kādambas*, and probably reigned about A.D. 580-600.]—The Shrine of the River Kṛishṇā at the village Mahābalesvara; by Rāo Sāheb Viṣṇanāth Nārāyan Mandlik. [An account of this shrine, sacred to the river Kṛishṇā, is here given. Another shrine at the same village, which is sacred to Mahābalesvara, the writer takes to be much more modern, and established after the model of the very ancient shrine of Mahābalesvara at Gokarna, in North Kānara.]—Some Further Inscriptions relating to the Kādamba Kings of Goa; by J. F. Fleet. [Seven more grants, mostly in the Canarese character. They show that the residence of these Kādamba princes was neither Bānavāsi nor Halsi, but Goa, Sanskrit Gopaka.]—Report on Photographic Copies of Inscriptions in Dharwar and Mysore; by Dr. Bhau Daji. [Accounts of fifty-seven inscriptions, mostly Canarese, contained in a photographic work published by the Committee of the Architectural Antiquities of Western India. They relate to the Chālukya, Yādava, Kulachuri, Kādamba, Gupta, Ratta, and Singha dynasties.]

**The Pandit**, vol. vi. No. 71 (Benares, April 1).—The *Śabdakhaṇḍa* of the Chintāmaṇi; with a Commentary. [Continued.]—The *Gopāla-līlā*, a poem by Rāmachandra [concluded; Booles 18 and 19]; with a *résumé* [upasaṃhāra].—The *Viddhagadha* of Kāvīrāja Rājasekhara [continued; the first part of the fourth act.]—Sanskrit text and English translation of the *Vidvanmanoranjanī*, a commentary on Sadānanda's *Vedāntasūtra*; by Rāmātīrtha. [Continued; by A. E. G. and G. D.]—Supplement: Catalogue of Sanskrit MSS. [Continued: Vols. 67-72 of the *Dharmaśāstras*.]

## New Publications.

**ANTHOLOGIA PALATINA**. Ed. Fred. Dübner. Vol. II. Paris: Didot. BERNHARDY, G. Grundriss der griechischen Litteratur. Dritte Bearb. 2. Th. 2. Abtheil. Halle: Anton.

**BRĀMINI-VILĀSA**, Le; texte sanscrit, publié avec une traduction et des notes, par A. Bergaigne. (9ième fascic. d. la Bibliothèque des Hautes-Études.)

**BOUCHÉ-LECLERCQ**, A. Placita Graecorum de Origine Generis Humani. Paris: A. Franck.

**MÉLANGES ASIATIQUES** tirés du Bulletin de l'Acad. impériale des Sciences. Tom. vi. livr. 3 et 4. St.-Petersbourg.

**WEBER**, A. Ueber ein zum weissen Yajus gehöriges phonetisches Compendium. Das *Pratijñāsūtra*. [Berlin Academy.] Berlin: Dümmler, in Comm.

The contents of the *Journal asiatique* and *Götting. gel. Anzeigen* were by an oversight placed in our last number under the head of Theology.

## ERRATUM IN No. 48.

Page 187 (B), line 4, for "one" read "our."

**POSTSCRIPT**.—We have received as we are going to press a full Report of the Meeting of Philologists at Leipzig, from our Special Correspondent; which we regret to be compelled to postpone for a fortnight.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. III.—No. 50.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for. The next number will be published on Monday, July 1, and Advertisements should be sent in by June 26.*

## General Literature.

## GERMAN MEDIAEVAL LITERATURE.

*Deutsche Classiker des Mittelalters*: mit Wort- und Sacherklärungen. Begründet von Franz Pfeiffer. Zwölf Bände. Leipzig: Brockhaus, 1866–1872.

*Deutsche Dichtungen des Mittelalters*: mit Wort- und Sacherklärungen. Herausgegeben von Karl Bartsch. Erster Band. Leipzig: Brockhaus, 1872.

ONE of the best and most thoughtful of the students of German literature, whose work on that subject is constantly appearing in fresh editions, the late Vilmar, truly said that there was one man above all others who possessed the imperishable merit of having fed and fostered with all his strength the growing taste for the treasures of old German poetry; this man was Friedrich Heinrich von der Hagen. Gratitude for what he accomplished in this field is the more incumbent on us at the present day as his merit is to a certain extent overshadowed by the progress of later researches, which naturally and inevitably supersede his. This is undeniably the case, as every student of old German literature is aware; for the long series of patient enquirers from von der Hagen to Pfeiffer and Bartsch have been unweariedly exploring its rich veins, and they have learnt to separate the pure ore from the dross surrounding it more perfectly than formerly. Nevertheless, the poetical productions of the German past remained inaccessible to the mass of readers who could make no use of even excellent critical texts, encumbered as they were with innumerable variants, and destitute, in spite of all the difficulties they presented, of every explanation of either language, meaning, or subject, which were consequently only available for the small class of professional students. To the cultivated majority all this body of poetry remained unknown, because the language was unintelligible. The *Nibelungenlied* was a solitary exception, in having penetrated by the help of translations to every level in the German people, whilst it had also become known to the other nations of Europe. The reason of the pleasure everywhere taken in this poem is to be found simply in its subject and spirit, which, even in translations, seize the reader with an irresistible power. It is, therefore, an exaggeration when Pfeiffer, the founder of the present collection, and editor of the first volume, observes in the preface to it: "The spirit of the past is only very imperfectly represented in translations; it is quite impossible to translate a Middle High German poem even tolerably into Modern High German; the thing cannot be done unless we sacrifice with ruthless hand its fairest bloom and fragrance, and what remains is at best a pallid copy of the original work." This remark is thoroughly inapplicable to translations like Simrock's of the *Nibelungenlied*, which has gone through twenty-four editions, and

VOL. III.—NO. 50.

reaches a fresh one nearly every year, and to various other excellent translations of the same poem, such as the one by Bartsch, who, since Pfeiffer's death, has edited the *Deutsche Classiker*, and evidently has shown that he does not share Pfeiffer's opinion on this point. Even mediocre translations may produce a powerful effect if the original is sufficiently valuable, as, to quote a single example, Wieland's translations of Shakespeare produced upon Schiller; and there is some truth even in Voltaire's assertion that the real value of a poem cannot be certainly determined except by rendering it into prose and observing if it retains its power; Charles Lamb's *Tales of Shakespeare* readily suggest themselves as an illustration. If we consider, too, how many excellent translations of poetry there are in nearly every literature, we feel at once that Pfeiffer was carried away by zeal for his own projected undertaking into a rash assertion; for the early German language and literature is no exception to the rule, and has at least as much affinity with modern German as that has with Greek or Sanskrit. Of course, to know the ancient poetical literature of Germany—or of any other country—so as to appreciate its inner nature and its most delicate peculiarities, the reader must acquaint himself with the originals, and the value and merit of the present editions is that they make these originals accessible to everyone who knows German. They presuppose readers who have no knowledge at all of ancient German, and the explanatory notes on the text consequently include every unusual word or grammatical form, instead of only noticing words which are not to be met with in the literary language, or of which the meaning has changed. For greater convenience the notes are placed at the foot of the page, the first time a phrase occurs in the book; as a rule they are not repeated afterwards; but that there may be no difficulty in referring back to the necessary note, there is a special table at the end of each volume of all the words that have been explained. Besides single expressions, all the difficult passages and constructions are explained by paraphrases; the substance of the text receives various illustrations; and, lastly, detailed summaries precede the separate lyrical poems and the sections under which the larger epic compositions are arranged, so that the connection of thought in the former and the course of the narrative in the latter case are both clearly brought out and the difficulties of interpretation reduced as much as possible in this direction also. The necessary clue to Middle High German metre is not wanting (though it is a question whether two-and-twenty pages is not more than is necessary for the general public), and the introduction to each poem discusses, at more or less length, according to circumstances, the life and times of the author, and the substance and bearing, literary, historical, mythical, or otherwise, of his work. It is evident, therefore, that every educated student of modern German, whether foreigner or native, may acquaint himself in these editions with the originals of the masterpieces of early German poetry, at a very trifling expenditure of labour. All the difficulties are cleared up by a series of writers who, like Professor Franz Pfeiffer, of Vienna, Professor Karl Bartsch, of Heidelberg, and their not less deserving colleagues, are taken from amongst the most accomplished students of early German.

A sufficient testimony to the opportuneness of the undertaking is to be found in the number of editions reached by most of the works of the series, which forms twelve volumes in all, though they can be bought separately. The first volume, containing the works of the famous lyric poet, *Walther von der Vogelweide*, which first appeared in 1866, reached a second edition in the following year, and by 1870 the two editions of nearly 4000 copies were exhausted, and,

after Pfeiffer's death, a third, superintended by Bartsch, made its appearance. That the poems of Walther should find that number of readers in the original language shows how widely these convenient editions must have circulated amongst the ordinary educated public (for the really learned cultivators of the study are to be counted by hundreds at most); and this notwithstanding the unavoidable difficulties of the original and the success of four editions of a very good translation by Simrock. The remaining eleven volumes contain the following poets and anonymous works: II. *Kudrun*; III. *Das Nibelungenlied*; IV.–VI. *Hartmann von Aue*; VII. VIII. *Gottfried von Strassburg*; IX.–XI. *Wolfram von Eschenbach*; XII. *Erzählungen und Schwänke* ("Tales and Jests"). The writers all belong to the first half of the thirteenth century, that is, to the golden age of old German lyric and epic poetry; and as they are more or less fully discussed in every history of the literature of the middle ages, I shall only notice a few points of detail.

With regard to Walther von der Vogelweide, the importance of his poetry to us lies, at least as much as in its intrinsic merit, in the glimpses into the political, ecclesiastical, and social conditions of his time which it affords; accordingly, a literature, abundant even to satiety, as Gervinus says in the last edition of his *History of German Poetry*, has grown up about him, and many various and extensive researches relating to his life and poems have been published, since the new epoch marked by Uhland's work on Walther in 1822, over and above simple translations and editions of the text. The subject-matter for such researches is not scanty, for besides the tender emotions of the heart, which are duly honoured by his muse, he was possessed by a much stronger and deeper passion, love of the Fatherland, for which no heart ever beat more truly. His voice was raised in defence of the honour of the emperor and the independence of the empire from foreign and illegitimate influences, and his most glowing strains sounded the praise and glory of Germany. In return for the favour of the Emperor Frederick II., who entrusted him with the education of his son Henry, he was always ready to assist his master with counsel or action, either exhorting him with words of encouragement not to succumb to the difficulties of his position, or detecting and denouncing the treacherous intrigues of the princes of the empire; or, again, with the generous daring of a man convinced of the justice of his cause, reviling the reprehensible and ruinous policy of the Roman court. An example of his *Sprüche* ("Political Poems") may be welcome, so we have chosen the following on the See of Rome. He compares Pope Innocent III. with Gerbert, afterwards Sylvester II. (999–1003), whose knowledge of natural history and mechanics caused him to be suspected of proficiency in the Black Art. But Gerbert (who, according to the legend, was carried off by the devil) only destroyed his own soul by his sorceries, whereas the present pope involves the whole of Christendom in his fall:—

"Der stul ze Rôme ist allerêrst berihet rehte  
 als hievor bi einem zouberaere Gêbrêhte.  
 der gap ze valle niwet wan sîn eines leben:  
 sô will sich dirre und all die kristenheit ze valle geben.  
 wan rüefent alle zungen hin ze himele wâfen  
 und frâgent got, wie lange er wolle slâfen?  
 sie widerwûrkent sîniu werc und velschent sîniu wort:  
 sîn kameraere stilt im sînen himelhört,  
 sîn süener roubet hie und mordet dort,  
 sîn hîrte ist z' einem wolve im worden under sînen schâfen."

"The chair of Rome is only now right well filled, as heretofore by the sorcerer Gerbert: he, however, gave to destruction nought but his own one life, but this one will destroy himself and all Christendom. Why do not all tongues call to heaven, wo! and ask God how long He will sleep? They (the pope and his party) work against His works and falsify His word: His treasurer (the pope) steals from him His heaven-ward (the treasure of divine grace); His peace-maker (the pope,

who ought to make peace, to pacify) robs here and murders there; His shepherd is become a wolf amongst his sheep."

This is certainly very vigorous language, and its application is not limited to Walther's age, any more than that of the next saying, addressed to the higher clergy of Germany and Italy, and beginning with the words—

"Ir bischof unde ir edelen pfaffen, ir sit verleitet.

sêht wie iuch der bâbest mit des tievels stricken seitet!" &c.

"Ye bishops and ye noble prelates, ye are led astray. See how the pope holds ye fast with the devil's meshes!" &c.

These specimens will be enough to raise the wish for a more intimate acquaintance with Walther.

We need say nothing of the *Nibelungenlied*, as the subject is sufficiently well known; in this collection it is edited, together with *Kudrun*, by Professor Bartsch. The latter, which has been called the *parhelion* of the *Nibelungenlied*, though less tragical than it, is likewise a powerful heroic poem. Its chief subject is the many combats attending the rape and recovery of Kudrun, a king's daughter in North Germany. This legend, of which the original substance is derived from Teutonic mythology, was known to the Anglo-Saxons, for the *Complaint of Deor* (eighth century) refers to one of the chief characters in it, the bard *Heorrenda* (in *Kudrun* called *Horant*); the same legend had been preserved, though with considerable alterations, in a Norse song on the Shetland Islands until last century.

The poems of Hartmann von Aue are edited by Professor Fedor Bech; they contain the epic narratives *Erec* and *Iwain*, both based upon old British legends, which may be illustrated out of Lady Guest's *Mabinogion* (*The Lady of the Fountain* and *Geraint ab Erbin*), though these versions are by no means among the most ancient; *Gregorius*, a mediaeval Oedipus legend, for Gregorius, without knowing it, marries his mother, but nevertheless, after long penance, is made pope; *Der arme Heinrich*, a legend, of which the source is unknown, telling the history of a leprous knight who is cured by the loving self-devotion of a young maiden; lastly, the *Songs and Booklets*, of which the first are love-songs, whilst the latter contain a monologue on love, and a dialogue between the body and the heart, on the question, which is the chief cause and which the chief sufferer from an unfortunate love. "Hartmann shows a rare mastery of style in all his works; no early German poet has equalled him in this respect, and none has thought out the subject of his epic poetry so thoroughly as he does."

The *Tristan* of Gottfried von Strassburg treats the same subject as the old English *Sir Tristrem*, edited by Sir Walter Scott, though there is no comparison between the poetical value of the two compositions. That of Gottfried possesses a gracefulness, an artistic beauty equalled by no other romantic poem of mediaeval Germany; in no other is there such a wonderful spiritual harmony between matter and form. We miss in this poet, it is true, the perfect simplicity and dignified clearness of his contemporary and model, Hartmann von Aue, and he is far from attaining the earnest moral severity and grandiose elevation of his opponent, Wolfram von Eschenbach, but he stands alone and unrivalled in the easy flow of his language, in pretty and ingenious playing upon words, thoughts, or images, and in the magically seductive and fascinating art of soul portraiture. This is the well-founded verdict of the editor, Professor Reinhold Bechstein, and it harmonizes completely with what other competent critics have said of Gottfried, whom even his contemporaries admired, praised, and imitated. In spite of particular objections, Gottfried, whose native town is now German once more, "is to be held in honour as one of the most eminent poets to whom Germany has given birth, and as a true classic of our ancient literature." The

ancient British framework of the Tristram saga is to be met with in nearly all parts of Europe; we find it in Provence, in Spain, in Italy, in Scandinavia, even in Bohemia, only not in Greece, as has been said by different historians of literature, and as even Bechstein seems to believe. The error probably owes its origin to Grässe's *Lehrbuch einer Literaturgeschichte*, &c., vol. ii. part 3, p. 205, for the passage there quoted, "von der Hagen, *Minnes.* vol. iv. p. 607," only says that there is still in existence a Middle Greek rhapsody, taken from the legendary cycle of Arthur and the Round Table, in which Tristram appears as one of the chief knights of the Table; which is of course quite a different thing from this being the subject of an independent Byzantine poem.

We come next to Wolfram von Eschenbach, "universally admitted to be the deepest thinker and the most powerful of all the courtly narrative poets of mediæval Germany. He alone has attempted to make the highest problems which agitate the human breast into a subject for epic poetry." With these words the editor, Professor Bartsch, begins his introduction to Wolfram's *Parcival* and *Titurel*, of which latter poem only fragments still remain. Both belong to the Grail cycle of legends, and to those Bartsch gives the necessary references, though enquiries into the origin of the legend are so far from being at an end that they have not hitherto led to any definite result. Oppert, for instance, whose essay on *Prester John* I noticed in the *Academy*, No. 17 (vol. ii. p. 122), in an excursus on the Grail, maintains that belief in its miraculous properties was derived from those which were popularly ascribed to Coral. Paulus Cassel (*Der Graal und sein Name*, Berlin, 1863) sees in the Grail and the food which it dispenses the *panes gradiles* of imperial Rome spiritualised, and so become a symbol of the Last Supper, and similarly *alii aliter*. *Parcival*, as Bartsch remarks, is a psychological epos, showing the inward development of man, as Goethe's *Faust* does in a dramatic form; like *Faust*, it is amongst the hardest of poetical works, and the more so since Wolfram's education was of the scantiest, scarcely coming up to the average standard of his time, so that the great soul, which is struggling to express itself, often finds a difficulty in attaining its purpose, and this occasions an obscurity of language which was made a reproach to him even by his contemporaries. Bartsch has done everything that was possible to reduce this obscurity, and the grateful reader will be able to judge by the few remaining doubts of the extent of his obligations to the editor. Still it cannot be denied that considerable patience, goodwill, and scientific zeal are needed to master all the difficulties which surround Wolfram's great spiritual epic, and that the *Tristan* of Gottfried von Strassburg will always be much more attractive than the *Parcival* to the majority of lovers of poetry.

The last volume of this collection contains *Erzählungen und Schwänke*, selected and edited by Professor Hans Lambel. These poems are the work of a tendency which we do not meet with until the full bloom of the popular and court epos has begun to fade, that is, towards the middle of the thirteenth century. They are, however, in the highest degree interesting and instructive, and they may attract, by their shortness, many readers who might be deterred from venturing upon the greater works. In any case, they form a suitable preparation for the study of early German literature in the original language; besides being connected by their substance, whether serious or jocose, to that cycle of fiction which, since the middle ages, has spread from the East into every part of Europe, and has penetrated so far into every section of society. Various reproduced in prose and verse, they procure us a degree of insight into the real life and

circumstances of different classes which the earlier poems, that do not leave the realms of imagination, are far from affording, and they are therefore at once amusing and instructive. From amongst the vast number of versified tales of this kind, Professor von der Hagen published a whole hundred in his *Gesammtabenteuer*, and Lambel has selected nine, in which these qualities are especially evident. The first is called *Der Pfaffe Amis*; the author, who had also produced a considerable number of such minor poems, was known as *Der Stricker*, "The Knitter," probably from the occupation of his ancestors. He here relates a series of swindling tricks played by an English priest (apparently from some place upon the Thames) in the course of his wanderings in different countries, after which he returned home, was made abbot, and died in the odour of sanctity. The narrative has probably an English original, but it has not yet been indicated. References, however, abound for the history of the single pranks of the priest, and may be found in Kemble, who also discusses *Der Pfaffe Amis* in his book, *The Dialogue of Salomon and Saturnus, with an Historical Introduction* (London: printed for the Aelfric Society, 1848). I may mention, in addition, that the first question put by the bishop to the priests, how much water there is in the sea, for which Kemble refers to Chaucer's *Second Merchant's Tale* (*The History of Beryn*), is also to be found in *Syntipas*, in *The Seven Viziers*, in the *Mischle-Sendabar*, in the *Life of Aesop* by Planudes, and in Plutarch's *Conviv. Septem Sap.* (c. vi.). *Der Meier Helmbrecht* ("Farmer Helmbrecht"), by Werner the Gardener, depicts in the most lively manner the circumstances and incidents of life amongst the villagers of Bavaria and Austria, as (we gather from other contemporary accounts) they either were or may have been in the middle of the thirteenth century. This poem may be looked upon as one of the most interesting in early German literature, but I cannot refrain from regretting that another short poem, *Der Weinschwelg*, "The Tippler," was excluded from this collection on account of its not being in narrative form, but descriptive of the growing delight and growing powers of an invincible toper, as he drains glass after glass. It is a masterpiece of its kind, though unluckily the end is wanting, in which the drunkard fastens on an iron coat of mail lest his belly should burst, but perhaps in the end the coat of mail itself burst. Gervinus, speaking of this poem, observes "that there is nothing more disgusting than solitary swilling, and nothing so contrary to the proper destination of wine, to open the heart and heighten the common rejoicings." He adds, indeed, that the art of the poem is so admirable that one overlooks the ugliness of the subject, but he has himself overlooked the fact that there is nothing in this remarkable poem (as I shall show in detail elsewhere) to indicate a solitary toper, so that his reproach against it on this account appears to be unfounded. But to return to the volume under discussion. *Der Wiener Meervart* ("The Voyage of the Viennese"), by Joyless, the name assumed by the poet, represents a company of tipsy citizens of Vienna, who begin to roll, and therefore imagine they are on board ship, and a storm is driving them hither and thither, so that they make great disturbance in the inn, and when they have slept off their carouse have to pay handsomely for all the damage they have done. The oldest form of this story is in Athenæus (ii. 5, p. 37), where the scene of the adventure is Agrigentum in Sicily. I will end with the *Herzmaere*, "The Tale of the Heart," by Konrad of Würzburg, who is also known by other poems. This is the story of the lover of a noble lady, who, dying in the Holy Land, charges his squire to embalm his heart and bear it to her in a golden casket. When he is near her castle, her husband meets the messenger, takes the

casket from him, and makes his cook prepare the heart and place it before his wife. When she hears what she has eaten, she says that after tasting such precious food she will never eat again, and dies of a broken heart. The legend belongs to a very widely spread group, which is well known from the tragic fate of the Trouvère of North France, Reignault, chatelan of Coucy, and the lady of Fayel, and of the Troubadour Guillem de Cabestant. Of course this volume, like all the rest, is provided with introductions and other necessary explanations.

I have here briefly indicated the contents of this whole collection, and I trust that what I have said of it may help to procure it a friendly reception from those who, out of Germany, may wish to study the classical productions of our early literature without serious labour to themselves. In Germany, as has been said, these volumes met with such speedy and universal acceptance that another enterprise of the same kind has been begun. The centuries immediately before and after the classical period of early German literature present a series of poems which well repay a more careful examination, in spite of their inferior perfection. They stand to the bloom or noonday of that literature in the same relation as the first dawn of spring or morning and as a mild autumn or the afterglow of evening. Accordingly Professor Bartsch has undertaken, in the second of the above named collections, *Deutsche Dichtungen des Mittelalters*, to publish the most considerable of the poetical productions of these two periods, which offer some entirely new features; for the gradual rise of the healthy middle-class spirit of later times, which appears in the *Erzählungen und Schwänke*, and lends a fresh charm to poetry, enlarges the intellectual horizon by the introduction of didactic and satirical subjects, while the drama develops itself into a characteristic, truly popular form. Amongst the works proposed to be published are *König Rother*, Lamprecht's *Alexander*, Freidank's *Bescheidenheit*, Ulrich von Lichtenstein's *Frauendienst*, *Reineke de Vos*, &c., poems to the importance of which every history of German or of general literature bears witness. The plan of the new collection, in which Bartsch is assisted by the same eminent scholars as before, and by others, is nearly the same as that already described, except that the explanations of the meaning of words are less frequently given in the body of the work, while the glossary at the end is fuller. The first volume has already appeared, and contains *König Rother*, edited by Heinrich Rückert. It is preceded by a very valuable introduction, which, however, by comparison with the *Deutsche Classiker*, may be thought to go too much into details uninteresting to the general public. Rückert has forgotten what the former editors always bore in mind, that these editions are not intended for the learned classes, but for persons who will take less interest in acute but prolix researches into the rise and history of a given poem than in a concise account of the results arrived at; he also demands from his readers too exact an acquaintance with the heroic legends of Germany. It might also have been thought that Pfeiffer's essay, above noticed, on the pronunciation and versification of Middle High German in general, would be enough to satisfy the curiosity of the general reader, and that Rückert's twenty-four pages on the special metrical and linguistic peculiarities of the poem edited by him run the risk of being skipped even by those whose thirst for knowledge is strong enough to lead them to wish to read it in the original. But I may perhaps be mistaken as to the intention of this second collection, for it almost seems from the foot-notes as if they were designed to lead the way to a more precise and thorough study of the early German language and literature.

FELIX LIEBRECHT.

Leighton's Works. Five Volumes. Longmans.

THERE are mountains and mountains, and there are mystics and there are mystics: it is only in Worcestershire that Malvern would pass for a mountain, and we might miss the real mystical elevation of Leighton if we did not look up to him across the dead level of eighteenth-century pietism, over which he towers with a modest dignity and sober grace to a really considerable altitude. An objective standard to measure spiritual force is unattainable and undesirable, and so far as an approximation to it is possible, it will be found not in a comparison of the heroes of the spiritual life with one another, but in a comparison of each with his surroundings. The real grandeur of a mountain depends quite as much upon its steepness as its height. These considerations are peculiarly relevant when we try to estimate the writings and character of a man like Leighton. His circumstances were unfavourable to the utmost exaltation of positive attainment, but they favoured both his reputation and his influence. In fact, it might almost be said that his life and his memory were the creatures of accident; or, rather, we should say that his lofty earnestness was a guarantee that he would be something, and that his simplicity left it to Providence to determine what. This union of receptivity and independence gives him an interest unique in its kind. A Covenanter who understood and practised the piety of the counter-reformation, an archbishop whose largeheartedness fascinated Doddridge, a humanist to whom Seneca was "the moralist," as Aristotle was "the philosopher" to St. Thomas and the Schoolmen, an enthusiast who before Coleridge sought the Platonic salvation in the Calvinist conversion—with so many attractions it is not wonderful that, though he is a spiritual writer, he should keep his place among the classics of an unspiritual literature. Indeed to mention this at all among his distinctions sounds like an anticlimax, though he divides the honour, for what it may be worth, with so great a name as Jeremy Taylor. He is like the—

"Western cloud,  
All billowy-bosomed; overbowed  
With many benedictions, sun's,  
And moon's, and evening star's at once."

Of course, under the circumstances, it is difficult to tell what is the real natural colour of the cloud, and one can only conjecture that it must be a very pure delicate neutral grey: men are more individual than clouds; but Leighton's individuality is of a sufficiently neutral description: the only characteristic that is left when we have exhausted the generalities of saintliness is a sweet, wistful, importunate un-earthliness. It is not that he is pining for the glories of heaven: though he speaks much of them, it is only to complain that we do not really desire them, to confess that we cannot imagine them; he has nothing of the fiery passion of mystics like St. Augustin or St. Theresa, nothing even of the hushed glow of the author of the *De Imitatione*, still less anything of the delicious dreamy fever of such writers as Herbert and Vaughan, who, one is tempted to think, found the pains of home-sickness pleasant enough. Leighton is one of the clearest and most practical of writers: one of the most reasonable, if we grant his premises; one of the most plausible, if we differ from him upon first principles. To borrow a distinction of Dr. Newman's, we might say that Leighton gave a "real assent" to the doctrine of the evil of the world that now is, while his assent to the doctrine of the better world to come, though it was given very heartily, and though it occupied very much of his thoughts, was only "notional" after all. He reminds us of one of the fathers of the desert who had a great reputation for wisdom, though he would never speak on any subject but the infirmities and

difficulties of monks. Of course all mysticism tends necessarily to a depreciation not only of ordinary knowledge, but of the intellect itself, but this depreciation may be either positive or relative; the intellect may be cultivated in order to be exhausted before it is transcended, and this is the tendency of mystics like St. Augustin and Swedenborg; or it may be neglected altogether, and this is the tendency of mystics like St. Francis and Boehme; or it may be disciplined and yet despised, dismissed as an unprofitable servant, before its work is begun, and this is the tendency of mystics like St. Bernard, and the author of the *De Imitatione*, and Leighton. This temper, as we see in St. Bernard, may be compatible with the very highest degree of practical ability, with the most unfailing courage, with the readiest intelligence; but it is not only the refinement and repose of the strong, it is also the deliverance and support of those who, without it, might be weak. As we look at Leighton's clear, soft, bright face, we feel that magnanimity and solidity were hardly his natural virtues. His life was a failure as far as influence or usefulness go, and he was not a man to console himself with either a high reputation or an easy conscience. He worked for many years as minister of Newbottle, and we do not read that he regenerated that highly favoured parish. He worked as Professor of Divinity at Edinburgh; he formed a few pupils like Scougal, now forgotten; otherwise he left the university as he found it. He worked as bishop and archbishop, and he did not pacify the Covenanters or save the episcopal establishment; all he achieved was to get his clergy to agree in synod to vague good resolutions; then in another synod the resolutions were renewed; by the third synod Leighton was reduced to write hopelessly and beg they might be acted upon. He postponed his own ordination till he was thirty, because he had noticed that others began to preach too soon and went on too long. When he was meditating the resignation of his see, he apologized, in what was meant to be a farewell letter to his clergy, for troubling the synod with such a trifle. He might almost seem to have taken his own measure accurately. His real success was in the writings which he constantly refused to publish; which he desired to have destroyed: and though these bear witness to his ineffaceable distinction, they bear witness to his limitation too. Not only do the same thoughts, the same phrases, the same quotations repeat themselves from one work to another, but in the *Commentary on St. Peter*, the work by which he is best known, whole pages are repeated with scarcely a variation. The explanation is obvious. Leighton only wrote for edification; he brought in what he considered a useful idea or a telling sentence as often as there was a chance of its producing its effect. He had such a predilection for the First Epistle of St. Peter that he delivered his course of lectures on it more than once, and this is the reason that it is so much the most voluminous of his expository works; either he or some admirers ran the MSS. of the successive courses into one, without a thought of suppressing the repetitions. When a man has his mind full of a limited number of thoughts, it is very much a matter of accident which passage of a book will remind him of one or other of them: and this is always Leighton's method as a commentator; he simply uses his text as a kind of multiplying mirror to reflect from a number of different points the light that is burning within him. This makes him one of the most capricious of expositors, and, in one sense, one of the least satisfactory. He accumulated in his youth a stock of knowledge which was certainly remarkable, but he lived upon it without increasing it; we should hardly be surprised to find that after he was settled at Newbottle he read nothing but his Bible and his commonplace-book. He

puts away everything that he can as a superfluity, and he positively resents anything like controversy. It would be unjust to call him a latitudinarian writer, but anyone who in an age of disputes indulges his impatience to place himself and keep himself at the centre of the narrowing circle of the undisputed is really doing the work of the latitudinarian whom he anathematizes. One reason why Leighton gave way to this temper so readily was, that opinion with him was so much a matter of obedience that it was really an impossibility for him to develop anything that a sturdy partisan could recognise as an honest manly conviction. This is the explanation of his position in the ecclesiastical politics of the time; he did his duty as he understood it under both the presbyterian and the episcopal establishment; and he endeavoured to convert and edify souls under both, without ever quite believing in either. Probably, though his belief in the Covenant was never more than second-hand, it was at one time less hesitating than his preference for episcopacy ever was. But he soon saw that the work of reformation was to be the triumph of a political party, not the elaboration of individual character; he was disenchanted, and the intolerable pretensions, the insane, tyrannical pedantry of the sincere Covenanters, completed the work. Leighton found himself, like most other sensible men, in the ranks of the moderate party, which was managed by Shairpe, a clever, generous man of business, rather indelicate than unscrupulous. If Shairpe was the support of this party, Leighton was one of its most conspicuous ornaments: the court had not made up its mind whether it wished or expected to rely upon energy or conciliation, but the latter alternative was the pleasantest; and if anybody could conciliate, it would be a man like Leighton, who combined the charm of cultivated fervour with the charm of ascetic gentleness. It was inevitable that a bishopric should be pressed upon him: he had really no reason for declining except humility, and he was allowed to escape with the smallest and poorest. It gives the measure of his docility—perhaps we may say, of his scepticism—that he submitted to receive episcopal orders as deacon and priest with much less resistance than Shairpe, only stating his personal opinion that his presbyterian orders were valid so far as they went. He soon found that the character of Shairpe, who was headstrong, though not inflexible, and the vindictive passions of the selfish cliques which had the ear of the government, destroyed any chance there might have been of verifying a plausible theory to which he inclined—that a sort of modified episcopacy, with a synod to prevent a bishop from browbeating the clergy, and a bishop to prevent the synod from tyrannising over the laity, was upon the whole the system likely to work with least friction, and therefore with most edification. He found himself almost exactly in the position of an ecclesiastical Falkland converted to a cause whose success it was impossible for him to promote, and almost more impossible for him to desire. Falkland, at any rate, had the consolation of esteeming and pitying Charles; he might hope for a soldierly death if a manly life were out of the question; but Leighton had to work with Lauderdale, and as he had no enemies, could not hope to be shot like Shairpe. It only remained for him to retire and spend his old age in spiritual conversation, in occasional ministrations, in the daily occupation which took up more and more time, “of dressing and undressing his soul.” He died as he had wished, in an inn, a stranger and a pilgrim to the last upon the earth where he used to say it was beyond angelical obedience to live for ever. He was on a journey to London, in the interest of an unsatisfactory nephew: he was unmarried himself, and lived after he resigned his see with a widowed sister-in-law, who scolded him for his pro-

fuse charities, and asked him if he supposed he could have given away so much if he had had children of his own; he replied, "I know not how it would be; but I know how it ought to be—'Enoch walked with God, and begat sons and daughters.'"

There we have the whole man with his timid, wistful, rapturous unearthliness which, as has been said, seems to give the keynote of his writings. Their real value is that they illustrate a character which may have lessons, which has certainly a fascination even for those who do not care to acquire it, though it is only the last who can hope to understand it. The main outlines of that character as they strike an outsider have been sketched already. Perhaps the most curious of the minor traits is his hankering after the Vulgate; he can never refuse to comment upon its rendering when it has a distinct set of associations, though he does not attempt to vindicate its superior accuracy. This is the more remarkable because he rejects with some disdain, not only the legend of the Three Kings, but also the mystical explanation of their gifts, which is found in almost all the fathers, and because he repeats the commonplace objections to popery with an air of calm conviction which is strange in a man who had learnt so much from papists. On the other hand, he uses St. Bernard and the *De Imitatione* as if the chasm of the Reformation had never yawned between: in many ways his whole turn of mind is mediaeval and scholastic, which shows itself in a taste for thinking by means of etymologies, a point of contact between him and Coleridge (it should be noticed that the etymologies are very fairly accurate). Other traits in his strictly theological writing may be marked in passing. He discouraged more and more decidedly, as he grew older, the craving for "assurance," which is always the crowning doctrine of pure and vital Calvinism, and he emphatically refused to answer the challenge in which all controversy tended increasingly to issue by producing a list of "fundamentals." Perhaps his pleasantest, though not his greatest, works are his academical addresses. The two most remarkable things in them are, first, the persistency with which he represents Christianity exclusively as a discipline of blessedness (and here he coincides with Locke, who escapes from scepticism by maintaining that God has given in Christ *πάντα πρὸς ζωὴν καὶ εὐσέβειαν*); and, secondly, his readiness to use the Neo-Platonists as authorities for the end, while denying them all knowledge of the way. Perhaps if he had maintained this exclusiveness throughout, he would not have committed himself to the Stoical precept of trying to fancy how we should bear trouble before it comes, though he is aware that at best there is something unreal in any victory that can be gained over imaginary antagonists.

We shall look forward with great interest to Mr. West's *Life of Leighton*, for which he has collected fresh materials; and even the existing materials have never been adequately used. Much might be done even from internal evidence to elucidate the very curious problem of Leighton's relation to the Catholicism of the Continent; and Mr. West's illustrations from the devotional literature of the counter-reformation, and from the Platonic pietists of the seventeenth century, show that he is on the right track. Perhaps, as this is the first edition in which anything except edification has been aimed at, we ought not to complain that much is still left for future commentators in the way of tracing both the extent to which Leighton borrowed from others, and the extent to which he repeated himself. It is to be regretted that the theological prepossessions of the editor have led him to ignore the great contemporary Scotch mystic, "sweet Samuel Rutherford," who deserves his name in spite of unmistakable narrowness and occasional coarseness. Of

Leighton's own career as a Covenantor, Mr. West speaks with laudable moderation; and one new view of considerable importance is put forward: many sermons are assigned, on internal evidence, to the periods of Montrose's campaign and Cromwell's domination, which had hitherto been assigned to Leighton's episcopate. The theory is ingenious, and a very little additional evidence, which perhaps the *Life* may contain, might make it certain.

G. A. SIMCOX.

### LITERARY NOTES.

Charles Lever, the indefatigable novelist, has died at Trieste, in his 67th year, prematurely, we might say, judging from the unabated vitality and buoyancy of spirits evidenced in his latest works, though viewed as the author of *Harry Lorrequer* and *Charles O'Malley*, our surprise is, perhaps, rather to find that he has not been with us longer. They belong to the boisterous, inorganic type of fiction, of which Smollett is the great representative; and though they can still be read with amusement, their humour requires to be supplemented by a virtuous consciousness, that one is studying in them an instructive phase in the history of light literature. Lever became popular as a painter of Irish character, and yet no successful novelist ever troubled himself less about character, properly so called. He could tell one good story after another so volubly as to keep up an unbroken chuckle from the first chapter to the last, which stood in lieu of a coherent plot, while his heroes fell in love and out, and won and lost fortunes and battles neither he nor they much cared how or why. But unity of purpose, action, or conception, were not natural to his novels, and when he changed his style, a quarter of a century ago, it was because a fine tact warned him that, for better or worse, the public taste was no longer what it had been. His least successful and characteristic works belong to this period, when he aimed at constructing an ordinary novel of incident without a thoroughly congenial or inspiring motive. In 1858 he became vice-consul of Spezzia, and about that time he hit upon a new vein, which, with varying but considerable success, he continued to work until his death. Instead of the rollicking, happy-go-lucky Irishman of his early works, his hero is henceforward a deep diplomatic conspirator, generally belonging to an obscure nationality, but exercising as mysterious a sway over the fortunes of Europe as any of Mr. Disraeli's magnates. This new type is not more faithful to nature, nor of more permanent artistic value, than the wild Irishman of whom the public had got tired; but Lever's knowledge of the travelling Briton, who is at once his butt and his public, his unflagging spirits and lively invention, which disguise the essential sameness of his subject, were quite enough to account for his fresh success. Without being profound or veracious, he was almost always readable, and it does not detract from his merit that he attained this result by trifling with such contemporary foibles as a taste for ethnological "questions."

The *Cornhill* reprints the substance of a paper read before the Royal Geographical Society in March, by W. G. Palgrave, giving an account of his travels in North-East Anatolia, in 1870, with special reference to the traces of glacial and volcanic action, and to the unexplored mineral riches of the country.

A paper by B. Delbrück, on German Rhyme, in *Im Neuen Reich* (May 31), traces the change from alliteration and assonance to regular rhyme to the growing disposition to place the accent on the root syllable. The Greeks did not use rhyme, because their accented syllables were higher in pitch, not louder or more emphatic. Classical Latin eschewed rhyme for the very reason that recommended it to the barbarian clergy; rhyming syllables were plentiful, but they were mostly terminations, and therefore empty and insignificant. Italian and the other Romance languages do not derive the full benefit from the use of rhyme for the same reason, and English is even richer than German for poetical purposes, because the disuse of case-endings, &c. leaves so many words reduced to one accented significant root syllable.

The historical *Kreisverein* of Swabia and Neuburg—a society which devotes itself to collecting and bringing to light documents bearing on the history of domestic manners rather than political and military operations—has just published a curious *Tour in the Netherlands*, by a military chaplain, in 1651, found in MS. in the library of Augsburg, and containing very lively pictures of the state of things during the Thirty Years' War.

Dr. J. A. Messmer writes to the *Allgemeine Zeitung* (June 1) to announce the discovery of the bronze gates of Byzantine workmanship belonging to the ancient basilica of St. Paul at Rome, which were supposed to have disappeared since the church was nearly destroyed by fire in 1823. The gates, which have been preserved in the adjoining Benedictine convent, are uninjured, and will be restored to their proper place when the church is rebuilt.

The death of F. Gerstäcker, the well-known traveller and *littérateur*, is announced, together with that of Julius S. v. Carolsfeld, the early colleague of Cornelius. The fate of Hippolyt Schaubert, also lately deceased, should be considered by those who believe that there are better tests than popular favour for discovering and rewarding literary merit. In 1867 a prize was offered by Friedrich Halm (Freiherr v. Münch-Bellinghausen) for the best comedy, and was won by *Schack dem König*, the work of an unknown police clerk. Scandal said that the adjudicators believed that they were crowning the work of Rudolf Gottschall, but even if the mistake was made, it was still sufficiently flattering to Schaubert, who "woke and found himself famous." Unfortunately, neither the critics nor the public were induced by this *quasi* official triumph to believe that all the past, and, still less, all the future, works of the poet were titles to immortal fame. Some of his smaller comedies had a complete success, but apparently rather in spite than because of the higher ambitions which he had been led to entertain.

## Art and Archaeology.

### THE PARIS SALON, 1872.

THE reaction of events, the depression and fatigue of the general mind, make themselves felt sensibly enough in the current official exhibition of the French arts in the Champs Élysées. The formal revival is spirited and complete; the universal resumption of artistic activity and production is nothing short of amazing; but it is none the less true that the activity seems to carry marks of deterioration and distress, and the production seems mostly of impaired quality or unsatisfactory kind. In a word, it is not a good Salon, and can scarcely be thought good, except in the eyes of such as are sworn *à priori* to official admiration of whatever may be the results of the last new régime. That the new régime of the Fine Arts in Paris—by which, pending the future of emancipation and private initiative which we are assured is in store for them, the Fine Arts are laid more strictly under State control and regulation than ever—that this régime has done much immediate harm to the exhibition can perhaps hardly be demonstrated. Artists rebel, and justly, against the change of rule which puts the election of the annual jury into the hands of those exhibitors only who have already won prizes or decorations, instead of the whole body of exhibitors as heretofore. That is a rule evidently tending to officialism, fageyism, academism—the principle, call it what you will, which is not unknown under another system nearer home, and which is apt to exclude or repress the efforts of originality and manifestations of the younger artistic mind. And the aspect of the Salon this year is by common consent "official"—unoriginal, with a few ambiguous exceptions, of which anon. Still, one does not hear of any specially unjust or notable exclusions, except that of Courbet out of intestine vindictiveness, and that of two painters of war scenes—one of them excessively skilful—under foreign pressure. The abstention of J. F. Millet, the foremost European painter (and poet) of country life and sentiment; of Stevens, the greatest master of tone and texture in modern interiors; of Bonvin, the strongest of the younger school of still-life painters, and of more notorious masters such as Gérôme and Meissonnier, is due to different causes; but a French exhibition of to-day from which these painters have

abstained, and which contains no remarkable new appearance, while it excludes a painter so powerful in his art as Courbet, and so instructive even in his perverse extremes, must needs be a comparatively tame and unattractive one.

It is scarcely worth while to chronicle the more or less fully accomplished inanities, whether according to the voluptuous, the elegant, or the severe routines of traditional practice, which occupy upon the walls a space quite out of proportion to the attention they command. The "Cigale" of M. Lefebvre, a regulation nudity with blue-black hair and almond-shaped eyes (destined, we believe, for the English market), may count as a leading example of the first class, and save the mention of a hundred other nudities and more, varying only in the forms and attitude of the model, little or not at all in sentiment and significance. One other only, "Le Sommeil" by M. de Gironde, a pupil of Gleyre and Bonnat, may be noticed as a *début* of vigour and promise in its way, quite unconventional in treatment, and really rich in colour and handling. The second or elegant convention finds its leader in M. Bouguereau, with a life-size woman-reaper whetting her scythe, and an idyllic harvest party—both perfectly unreal and full of graceful vapidity and nicely trained artifice; unless indeed a more distinguished name were chosen, and the perfectly feeble and characterless "Giacomina," a costumed portrait of Cabanel, were pointed out, as one of the least fortunate of its painter's efforts. Then there are large "Temptations of Christ" which nobody looks at; large mythologies of "Herakles with the Hydra" (Bin, 143), and "Nessus with Deianira" (Tillier, 1454), which are not good either; an ambitious allegorical "Fortune" of M. Sirovy, which is showy and well-placed, but destitute alike of taste and imagination; an immense "Massacre of the Innocents" by Gustave Doré, invented with some power and originality of that now rather threadbare order which we know so well, coloured and carried out with even more than his usual disagreeable technical incompetence. Upon the whole, we note a considerable tediousness and decrepitude in all the higher, the more ambitious, manifestations of the painter's art; nothing which can be said to belie the exhaustion which one has long traced growing upon both the romantic impulse in serious French figure-painting which starts from Delacroix, and the classical impulse which starts from Ingres. On the other hand, the realistic impulse, which finds its central embodiment in Courbet, is not fairly represented; and M. Jules Breton, who has done some such tender and touching, although unequal, work in the realists' especial field of rural life and labour as they are, leans this time unfortunately to a weak and scarcely sincere convention. Both his pictures seem too large for his strength; the colour of their cold foliage-greens and cold drapery blues or violets is unpleasant, and the modelling and design of the peasant-girl figures, nearly life-size, is neither very frank nor very correct: it is not a good year for M. Breton, in spite of his conspicuousness. M. Manet, the well-known and much-contested talent who represents in an extreme form, and with an executive bravura which is his own, the logical doctrines of the more violent realists—modernists—has no figure-piece in the Salon; only a sea-view, with the fight of the *Kearsage* and *Alabama*; the deep blue-greens of the sea, the blacks of the ships' hulls and smoke, the tones of the sky, are seized with a forcible precision, and struck upon the canvas in rough traits which disguise a good deal of real subtlety, both in colour and drawing, under a wanton manifestation of slapdash. Richness and pleasantness in the actual management of paint are things sought by few French artists; and among these few M. Bonnat has a right to count; but in the clever Oriental piece, "Cheiks d'Akabah," he exaggerates this aim, and makes an excessive impasto cover real defects of thoroughness, a strained monumentalism of arrangement and composition serve instead of real dignity of drawing. Very much better, and powerful both in character and colour, is his portrait of an old woman of the Basque province (163). M. Gérôme finds an imitator, if not a substitute, in his pupil Lecomte du Nouÿ, whose picture of a Pharaoh receiving evil tidings, of which he imperturbably decapitates the bearers one after another, has a good deal of the master's power and accuracy, as well as more than enough of his cynical imagination and cruelty. A second (and this time a draped) "Sommeil" on a large scale—it is a young mother and child solidly painted, with rich coloured reddish and greenish coverings—has to be noticed as a first and considerable success by a pupil of Gleyre, M. Eugène Lecadre.

Turning to decorative ideals, the "Idylle" of M. Henner and "Espérance" of M. Puvis de Chavannes furnish two very opposite kinds of example. M. Henner is an Alsatian artist almost as well-known for frigid academical composition as for charming and spirited portraits of children which do not look as if they could be done by the same hand: this "Idylle," however, is neither one nor another, but a little classical dream of two naked women by a well on a hill slope, conceived in a fresh and simple spirit, and not only well drawn, but charmingly painted in an original key of pearly colour. M. Puvis de Chavannes' work is always flatly tinted, more in the manner of tapestry decoration than of oil-painting; he has a refined sense of colour, and a certain fanciful rigidity and archaism which remind one of some English contemporaries; this "Hope" is not a successful example. M. Ernest Aubert may be remarked, with his "Fil rompu," as a fair follower in the decorative path of Hamon; also the "Eve" of M. Laurent Bouvier. One of the very good pictures of the year, in a direction rather English as one would say, is the "Heure de la Marée" of M. Billet; a Normandy sea-side, with the fisher population among their beached boats inspecting and collecting the haul; very pleasant colour and spirit in the men, women, and children, with nice oppositions of rosy cheeks and blue jackets, and a quite natural and unforced sense of life, movement, and sea-swell.

*Genre*-painting, says current criticism, and not history-painting, is the strength of this year's Salon. Yet it does not contain much that is really remarkable in the way of *genre*: there is M. Caraud, of course, with his clever soubrettes in costume; there are some, but not many, of the followers of Alfred Stevens. The three names that I should be inclined to select in this field are the little known ones of M. Léon Saunier, whose two little out-door lady groups are painted with some discordance of tone, but with an extreme delicacy of drawing and expression, and a charming adjustment in their backgrounds of landscape; M. Claude, who sends the best Rotten Row scene of any that has been attempted—it is quite small, but catches admirably the pictorial effect and sentiment of the scene—and a careful and brilliant little interior, "l'Antichambre," with a lady and dog; lastly, M. Chenu, who has caught some provincial bourgeois types with great spirit and accuracy, and set them to drive a-visiting in a sunny weather, of which he renders the effect admirably. So is M. Jules Héréau's "Omnibus Station at Batignolles" an excellent piece of its kind.

There remain the class of war pictures, the class of landscape, and the class of portraits (and the sensation of the year has been made by a great pair of portraits): these, together with the sculptures, must be reserved for another number.

SIDNEY COLVIN.

### ART NOTES.

Under the title, *Histoire de l'Ornement russe du X<sup>e</sup> au XVI<sup>e</sup> siècle*, a work is in course of publication which is of considerable importance in a special department of art. It consists of a collection of initials and other examples of ornamental design selected from Byzantine and Russian MSS. and printed in colours. The collection is arranged in chronological order, and accompanied by an explanatory and historical text. The Russian government, besides contributing a considerable sum towards the expenses of this very costly undertaking, has subscribed for 500 copies. Two hundred only come into the market, and may be procured from A. Morel, Paris.

In the present number of the *Zeitschrift für bildende Kunst*, Dr. Engelmann continues his valuable notice of the recent excavations in Pompeii and Herculaneum; Professor Conze contributes a notice of an early Christian sarcophagus discovered at Salona, and now placed in the museum at Spalatro; and Carl Klaus concludes his paper on the contemporary school of sculpture in Dresden.

M. Léopold Flameng, who is well known by his excellent work in the *Gazette des Beaux-Arts*, has undertaken to illustrate a forthcoming edition of Victor Hugo's *L'Année terrible*.

The first part of Lübke's *Geschichte der deutschen Renaissance* has now appeared. After an introductory chapter, the

author passes into the description of the commencement of the new style amongst the painters and sculptors of the sixteenth century, and closes with an analytical examination of German Renaissance architecture. The next three numbers will treat of the now remaining monuments arranged in topographical order. It is expected that the entire work will be out before the end of the year.

The exhibition of the competitive designs for the German Houses of Parliament was opened at Berlin on May 2. There are fifteen English competitors, amongst whom we find the names of Gilbert Scott, Godwin and Edis, Kerr, Emerson, Turner of Dublin, W. W. Robertson, S. Williamson, and others. The accepted plans, we now learn, are those of an architect of Gotha; Mr. Gilbert Scott and Mr. J. Scott being bracketted second.

The miniatures of the Allègre collection were sold on May 14 and 15. A very fine miniature, on vellum, by van Blarenberghe (signed and dated 1763); 30,100 frs. The subject was the "Foire de Saint-Germain."—Collection Sompayo: An oval miniature, on ivory, by Hall, representing the artist's wife, sister, and child; 19,000 frs.—Sainte sale and collection Daugny: Oval miniature, on ivory, by Fragonard, the portrait of a boy in harlequin's costume; 3320 frs. A small round miniature, on ivory, by Hall, in a gold locket, the portrait of the celebrated Sophie Arnould; 2120 frs. Miniature portrait of the no less celebrated Mlle. Du Thé, by Augustin; 4300 frs. "Le Triomphe d'Amphitrite," and "La Toilette de Venus," by Charlier; 6850 frs.—Collection Hope: Oval miniature, by Sicardi, "Harlequin and Columbine"; 6020 frs.—We find that the best of the Roëll-Hodshon collection will find its way to England. Sir Richard Wallace is said to have been the principal purchaser. To him fell the gem of the collection, the "Interior of a Church," by Emanuel de Witte, the price of which, 29,700 gulden, can hardly be considered out of the way, though it is perhaps ten times as much as any picture of de Witte's ever before reached. Sir Richard also became the possessor of the fine "Wooded Landscape," by Hobbema; of the "Boeren Binnenhuis," by L. Bourse (dated 1556); and of the very fine female portrait by Netscher. This last went for the very moderate sum of 660 gulden. A far inferior example of the same master, "Four Children on a Balcony," was bought by Mr. Holloway for the absurd price of 16,610 gulden; but he acquired a first rate van de Velde, of his early period, "Still Sea, with Ships," for 14,550.

The new number of the *Jahrbücher für Kunstwissenschaft* (May 10) opens with a series of corrections and amplifications to the *Cicerone* of W. Burckhardt, by Dr. W. Bode. Travellers using the *Cicerone* as a guide-book (and for travellers in search of art it is the best and indeed the one guide-book) will do well to furnish themselves with this appendix; and such an appendix, by so well qualified a hand as Dr. Bode's, might usefully be repeated at intervals. The necessity for correction lies rather in re-arrangements or new discoveries of works of art—sometimes, unluckily, in their decay—than in original errors or oversights of description. Florence, where so much has lately been done for the preservation and exhibition of treasures, takes naturally the largest place.—The same review contains a discussion of W. Schmidt on the signatures and attributions of doubtful pictures in the galleries of Munich and Schleissheim, and a chapter of *Holbeiniana* by the same writer, going minutely over the much trodden ground, and deciding on the whole for the date 1517 instead of 1514 (which, is the question) as that of the elder Holbein's departure from Augsburg.—But the most important piece in the number is the set of unpublished documents in relation to the building of the cathedral at Siena, drawn by Mr. Charles Eliot Norton from the archives of the city, and here printed by him with a running commentary. The eight documents run from 1260 to 1388, through the greatest prosperity of the city down to its decline, and the consequent abandonment of the scheme for turning the existing cathedral into the transept of a vaster new one, which resulted after the devastations of the plague in 1348. They constitute as complete and minute a picture as exists, both in spirit and detail, of the mode in which the great monuments were undertaken and carried on by the civic bodies of the middle ages and their workmen; and Mr. Norton's observations are thoroughly luminous and intelligent.

Appropos of the completion of Theodor Grosse's frescoes in the Leipzig museum, Herr Max Jordan, the German translator of Crowe-Cavalcaselle, takes the opportunity of giving (*Im Neuen Reich*, 22) an essay on the art and history of fresco-painting generally, justly enough claiming for his countrymen since Overbeck and Cornelius the credit of having stood alone as revivers of the pure practice—*buon fresco*—and ranking Theodor Grosse as one of the most distinguished of their successors. The artist has filled the vaulted divisions of a hall of moderate dimensions with an abundance of mythological, allegorical, and historical inventions—the successive incidents of the Mosaic Creation, the Birth of Eve, the Fall, the Expulsion, Michael overthrowing Satan, the Four Great Seers of the Old Testament; elsewhere Eros and the Graces, Imagination riding upon a Sphinx, the Fates, the Virtues, Egypt representing Architecture, Greece, Sculpture; Italy, Painting; and Germany, Music.

The *Chronique des Arts* relates the improvement made in the arrangements of the local museum at Orleans since the appointment of its new director, M. Eudoxe Marcille, the distinguished amateur who, with his brother (director of the museum of Chartres), possesses by inheritance the choicest as well as the largest extant collection of the French masters of the eighteenth century.

The snuff-boxes and bonbon-boxes of the Allègre collection have been sold at the Hôtel Drouot with great success, at prices ranging from 4,000 to 25,000 francs.

In a pamphlet recently published at Vienna, entitled *Eine Studie über chinesische Emailvasen*, M. Lippmann, its author, traces in an interesting manner the art and manufacture of Chinese pottery, from the days of the Shang Dynasty (1743–1112 B.C.) to comparatively modern times. Native archaeologists have devoted much time and labour to the exploration of the same field, and the existence of numerous works on the subject, notably the *Po-koo-too*, in sixteen large volumes, and the *Sesing-koo-keer*, in forty-two folio volumes, attests the scholarly and imperial interest taken in this branch of antiquarian research. From both of these works M. Lippmann has drawn much of the valuable information contained in his pamphlet, and from their numerous illustrations he has reproduced a few engravings of typical specimens of the art. But M. Lippmann has also studied the art in Europe, and is thus enabled to furnish us with a considerable amount of original matter. In common with other writers, he looks upon "chinesische Emaille als Tochter der byzantinischen Emailkunst."

## Music.

### THE WAGNER FESTIVAL AT BAYREUTH.

Bayreuth, May 22.

It is now scarcely ten years ago since Wagner, in the preface to his dramatic version of the *Nibelungen Saga*, first hinted at the possibility of having his great work performed by the voluntary assistance of his nation. The chances of such an enterprise were at that time the most unfavourable that could be imagined. Although the success of Wagner's first three operas, wherever they had been adequately performed, was an undeniable fact, still his more advanced ideas of the fundamental reorganization of the music-drama had found so little responsive sympathy amongst the German nation—if such a nation could be said to exist at all—that the utter derision with which Wagner's appeal was received by the hostile press seemed but too well justified.

Amongst the causes which have removed all these obstacles and now assembled a crowd of enthusiastic admirers at Bayreuth, I would mention—besides the irresistible power of his genius as realised in the successive works of Wagner—the great political events of the last two years, in which the various German tribes, so long divided by internal animosities and party struggles, have at last recovered the feeling of solidarity. For a philosophic people like the Germans there soon arose the necessity of symbolizing the newly recovered political unity in a work of artistic import; and it was therefore only natural to see the best amongst the nation turn towards the purest sources of old Teutonic inspiration as Wagner has embodied them in his grand dramatic work.

The master's call therefore for the means necessary to secure a worthy performance of his *Nibelungen* drama was responded to with a most promising willingness; and it was the laying of the foundation-stone of a theatre to be erected for the purpose that had assembled the friends of Wagner from all parts of the world.

I shall not intrude upon your space with a description of the ceremony, which proved a failure because of a most pertinacious rain, nor of the banquet, the horrors of which from a culinary point of view would be scarcely realisable to the English mind. The programme of the concert which formed the most interesting feature of the Bayreuth festival consisted only of the Ninth Symphony of Beethoven, preceded by Wagner's *Kaisermarsch*, the latter being chosen mainly as a representative embodiment of German national feeling. With great tact Wagner had refrained from entering into competition with Beethoven's gigantic work, and concentrated all the energy of his mind in the service of doing justice to the great teacher's aspirations. At the same time the choice of Beethoven's Symphony in D Minor was the most appropriate that could be made on this occasion, because it forms as it were the foundation of the great development of modern German, and especially of Wagner's own, music. The principle of this new phase in art, as the present writer has expressed it on former occasions, is the demand for a poetical basis of music; that is to say, a latent impulse of passionate inspiration which guides the composer's hand, and the conditions of which are in themselves by far superior to the demands of music in its independent development. The rules arising out of these demands are in the Ninth Symphony violated, indeed completely overthrown, with a freedom of purpose and grandeur of conception that can be explained only from Beethoven's fundamental idea as it gradually rises to self-consciousness in the words of Schiller's ode *An die Freude*. In his celebrated programme to the Ninth Symphony, which Wagner wrote five-and-twenty years ago, he has interpreted Beethoven's poetical intentions by illustrative quotations from Goethe's *Faust*, connecting in this way the two greatest works that German genius ever conceived. He there declares this symphony to be the struggle of the human heart for happiness. In the first movement this longing for joy is opposed and overshadowed by the black wings of despondency. In the plaintive notes of the orchestra we hear the sad burden of Faust's words:

"Entbehren sollst Du, sollst entbehren."

The second movement, on the other hand, with its quick and striking rhythmical formation, describes that wild mirth of despair which seeks respite and nepenthe in the waves of physical enjoyment. The trio again might be considered as a dramatic rendering of the village scene in *Faust*. The adagio, with its sweet pure harmonies, appears after this like a dim recollection of former happiness and innocence—

"So sad, so strange the days that are no more."

In the fourth movement at last Beethoven leaves the limits of his own art entirely. The repetition of the main motives of the foregoing movements, always interrupted by the tremendous recitative of the double basses, is absolutely unexplainable from a purely musical point of view. It is the highest effort of dramatic characterization instrumental music has ever made, and seeing that it has reached the limits of its own proper power, it has to call the sister art of worded poetry to its aid. Beethoven has done this in a way "in which," to speak with Wagner, "we do not know whether to admire more the master's bold inspiration or simple *naïveté*." To the grand choral piece which follows, the words of Schiller's ode form the best comment. It is obvious how the introduction in this way of words as the necessary complement of musical expression even at its climax of perfection became the stepping-stone to the further development of poetical music as we discern it in what is generally called the "music of the future." It is equally clear that it requires more than the common intellect of the general run of conductors to grapple with the intellectual (not to speak of the musical) difficulties of such a work. Hence there is scarcely another composition in existence which has been injured so much by the traditional routine of musical philistinism. I candidly confess that, although I have heard the Ninth Symphony at least three score and ten times, I never quite understood its wonderfully grand and harmonious structure till to-day. Wagner indeed seems the born interpreter of this monumental work of musical genius. With a wonderful power of congenial receptivity, he conceives the grand intentions of his master Beethoven, and moreover he is in a most eminent degree a conductor. It is difficult to say what are the mysterious conditions of musical leadership; they are certainly nearest akin to the qualities of a great military commander; and one

can only agree with good old Emperor William, who, himself entirely innocent of musical knowledge, said after Wagner's late performance of Beethoven's C Minor Symphony, at Berlin, in his homely way: "Now you see what a good general can do with his army." It is indeed one of the most interesting sights to see the immediate *rapport* established between Wagner and his orchestra as soon as he raises his baton. Each individual member, from the first violinist to the last drummer, is equally under the influence of a personal fascination, which seems to have much in common with the effects of animal magnetism. Every eye is turned towards the master; and it appears as if the musicians derived the notes they play not from the books on their desks, but from Wagner's glances and movements. I remember reading in Heine a description of Paganini's playing the violin, and how every one in the audience felt as if the virtuoso was looking at and performing for him or her individually. A gun aimed in the direction of many different persons is said to produce a similar illusory effect; and several artists in Wagner's orchestra and chorus assured me that they felt the fascinating spell of the conductor's eye looking at them during the whole performance. Wagner in common life is of a rather reserved and extremely gentlemanly deportment; but as soon as he faces his band, a kind of demon seems to take possession of him. He storms, hisses, stamps his foot on the ground, and performs the most wonderful gyratory movements with his arms; and woe to the wretch who wounds his keen ear with a false note. At other times, when the musical waves run smoothly, Wagner ceases almost entirely to beat the time, and a most winning smile is the doubly appreciated reward of his musicians for a particularly well executed passage. In brief, Wagner is as great a virtuoso on the orchestra as Liszt on the pianoforte, or Joachim on the violin.

The result of this masterly performance of the Ninth Symphony will, we have no doubt, be a very beneficial one, the more so as many of the most eminent artists and conductors of Germany were present amongst the audience or performers. We mention only the names of Messrs. Riedel and Swendsen from Leipzig, Cornelius from Munich, Richter from Pesth, and Dannreuther from London. The solo-quartet consisted of Messrs. Niemann and Betz and Mesdames Lehmann and Jachmann-Wagner.

To judge from the energy of Wagner, and the admiring devotion of the whole audience, as shown on this occasion, the final success of the master's grand scheme may be expected with certainty.

I shall take an early opportunity of pointing out the more striking differences between Wagner's interpretation of the Ninth Symphony and the traditional way in which this work is generally performed both in Germany and in this country. This, however, cannot be done without frequent references to score and metronome, and would therefore exceed by far the scope and limits of this letter. F. HÜFFER.

#### NOTE.

Liszt's Concerto for Pianoforte in E Flat was performed with great success at the Sixth Philharmonic Concert, by Mr. F. Hartvigson. This is the third time that the work has been played in London, and by each consecutive hearing it seems to gain more and more upon the audience. The genuine and unanimous applause which rewarded Mr. Hartvigson's brilliant rendering at the most conservative of our musical Institutes seems indeed to indicate a strong current of public opinion in the direction of more advanced art-tendencies. It might be interesting from a psychological as well as from a musical point of view to draw a parallel between the three excellent pianists to whom we owe the reproduction of Liszt's work within the last two years. As far as brilliancy of technical execution and verve is concerned, Mr. Hartvigson need not shun a comparison with either Mr. Bache or Mr. Dannreuther, while we sometimes missed in his playing that poetical appreciation of the finest intentions of the composition which more than fully make up for what the latter artist may here and there want in physical strength. In Mr. Bache we most admire the firm grasp of the whole rhythmical and melodious purpose of the work, as shown in his masterly way of phrasing and declaiming the single musical passages. During the whole performance on Monday we remarked a slight tendency (we must suppose on the part of the conductor) to take the tempo in the cantabile passages too quickly, while Mr. Manns, at the Crystal Palace performance, seemed rather inclined to do a little too much in the other direction.

#### Philosophy and Physical Science.

*Darwinism in Morals, and other Essays*. By Frances Power Cobbe. Williams and Norgate.

THIS book consists partly of popular essays on religious history and biography, and partly of discussions which, without being less popular in tone, have a more scientific aim, and show more independent thought. Among these latter is the essay which gives the title to the book. Miss Cobbe, while welcoming Evolutionism as rather helpful than hostile to religion properly understood, attacks Mr. Darwin's special view of the evolution of morals: under two heads, "first, his theory of the nature of conscientious repentance, which represents it as solely the triumph of a permanent over a transient instinct; secondly, his frank admission that though another animal, if it became intelligent, might acquire a moral sense, yet that he sees no reason why this moral sense should be the same as ours." On the former point Miss Cobbe argues effectively, first, that the peculiar quality of Remorse (as distinct from regret) is unexplained; and, secondly, that the being in whom "instincts of sympathy and goodwill to his fellows" are normal and selfish impulses exceptional is scarcely ancient—or even modern—man, as history shows him. There is probably some carelessness of statement in Mr. Darwin's exposition of his own theory. If in the "permanent social impulse" we include not merely goodwill towards other men, but also desire of their approbation and dread of their displeasure both in itself and its consequences (not omitting the displeasure of superhuman beings), the view becomes more plausible. And Mr. Darwin seems to have intended to include these, as Mr. Spencer and others have expressly done. On the general subject of evolution in morals, Miss Cobbe's remarks, though intelligent and often eloquent, seem to involve one or two common confusions of ideas. First, the unhappy ambiguity of the term "Utilitarianism" leads her to confound the derivation of the *form* of duty (with the peculiar emotions that accompany it) from experiences of *individual* utility with the reference of the *matter* of duty to the standard of *universal* utility. Otherwise the historical genesis of the moral faculty ought to be comparatively indifferent to her, on her general

principle that "the ancestry does not degrade the progeny." If man has sprung from the Ascidian, and yet is no less man, Duty may have sprung from Pleasure and Pain, and yet be no less Duty. Again, the issue between Utilitarianism and Intuitionism as a theory of Practice is only indirectly connected with any evolutionary hypothesis: and a further distinction is necessary between an explanation of common-sense morality as it is and an exposition of morality as it ought to be. Because a utilitarian holds that the current rules of social behaviour have a general reference to the well-being of the community, he does not therefore regard them as the final *axiomata media* of scientific Utilitarianism. This distinction—for want of which both Locke and Mr. Spencer have been unfairly attacked—Miss Cobbe does not sufficiently bear in mind in criticizing Mr. Darwin's well-known suggestion of the hypothetical morality in an intellectualised bee-hive, where "unmarried females would think it a sacred duty to kill their brothers, and mothers would strive to kill their fertile daughters." It is on these habits that the well-being of the bee-community would seem at present to depend; and we may grant that they would be represented as rules in the conscience of an average member of the hive. But a superior bee, we may feel sure, would aspire to a milder solution of the Population-question: and if we compare Mr. Darwin's hypothesis with the *actual* human conscience, we can find a tolerable parallel in the moral sense of an Eleazar or an Alva. And Miss Cobbe does not sufficiently put herself at the point of view of Utilitarianism to see that its principle admits of almost any degree of variation in actual rules without giving up the absoluteness of Duty.

In two essays on "Unconscious Cerebration" and "Dreams," Miss Cobbe, while giving an excellent popular exposition of Dr. Carpenter's theory, bases on it a peculiar argument for the non-dependence of soul on body. In dreams, as due to unconscious cerebration, the real, responsible Ego, the essence of which is Will, is not concerned: hence, argues Miss Cobbe, we find, as we should expect, that the sense of voluntary effort and the phenomena of moral emotion are curiously absent from our dream-life. The argument is ingenious: and if the facts on which it rests are ascertained by a wide induction, they are certainly striking. But Miss Cobbe seems scarcely to contend for their universality: my own experience affords opposite instances: and I should have thought that the consciousness of violent voluntary effort was incident to most nightmares, and that moral feeling was rather both present and absent incongruously (like other dream-phenomena) than absent altogether. Moreover, in the whole discussion, it is not sufficiently observed that the phenomena of dreams are not in themselves unconscious, though involuntarily originated: and that as conscious, they cannot be clearly thought as purely material changes.

The remaining essays show the same transparent liveliness of style, the same good sense, wide and ready sympathy, frank and vivacious optimism, as the other writings of the author. Miss Cobbe is an excellent populariser, and treats of the phenomena of religious history in a thoroughly intelligent and well-instructed manner, with much sobriety of judgment and occasionally penetrating suggestiveness. The tone of the essays is not so much scientific as docile to and receptive of science. Pure Theism appears here in a somewhat sectarian attitude, if we may apply the term "sectarian" to indicate a polemical purpose carried out with no bitterness or unfairness, but everywhere apparent: whether she points to the Oriental exaggeration of verbal inspiration, parallels Aryan with Semitic sacred literature, or notices the serpent and tree worship in Eden.

Perhaps the best thing in the book is a discussion of "Auricular Confession": unfortunately few of those to whom the question is one of practical importance are prepared to argue it merely on the basis of spiritual experience.

H. SIDGWICK.

## Notes of Discoveries and Scientific Work.

### Psychology.

Mr. Roden Noel contributes to the June number of *Contemporary Review* a remarkably vigorous and original, but at the same time singularly incoherent article on the Philosophy of Perception. The incoherence is partly due to plethora of matter: Mr. Noel attempts not merely to expound a somewhat complicated theory of his own, but to present it in relation to the views of Berkeley, Kant, Hamilton, Mill, Martineau, with incidental notices of Hegel and others: moreover, Mr. Noel does not confine himself to the Philosophy of Perception, but indulges in swift, abrupt digressions into cognate subjects, which break the continuity of his exposition. But there seems to be some deeper incoherence in his theory itself, due, we think, to a source fertile in confusion in later English philosophy, a Kantian element imperfectly harmonized with indigenous notions. Mr. Noel holds that we have intuitive and certain knowledge of the non-ego, as that which resists our effort: that reflection shows us percipient of this non-ego as having primary and secondary qualities, and that the supposed scientific grounds for rejecting this affirmation are not really valid. But to the question whether these qualities exist, as perceived, out of perception he offers two different answers, between which he seems to hesitate. The first is that secondary qualities, and to some extent primary, are "created in perception . . . comparatively dark external qualities being brought into relation with corresponding internal capacities, the vari-coloured flame of consciousness springs between." Whatever may be said for this theory, it certainly does not "satisfy common sense": accordingly, Mr. Noel offers for more complete satisfaction his second answer. Colour, as we perceive it, may be a property of the luminiferous ether: the different undulations may actually be coloured red, blue, &c.: and similarly in the case of sound, though it is less clear that we naturally conceive resonance (as distinct from vibration) to exist in things when perceived. Here again the divergence from common sense is greater than Mr. Noel seems to see: a rose, causing red undulations in the space between it and our eyes, is not the red rose that we naturally believe in. A deeper difficulty emerges when Mr. Noel adds suddenly that "the whole external thing and its qualities . . . is phenomenal as well as noumenal. It is in time and space." But if what is in space is phenomenal, primary qualities are only known to us as they appear, *i. e.* other than they are apart from our apprehension: and we seem landed in the first theory again. Part of the article is taken up with a subtle and closely reasoned polemic against Theism—or rather against Divine Creation as an explanation of the origin of the universe.

### Geography.

**Lake Tanganyika.**—The welcome telegram from Zanzibar which confirms Dr. Livingstone's safety also decides the long vexed question of whether Lake Tanganyika belongs to the Nile basin in the negative, and apparently leaves no other possible outlet for the fresh waters of this great lake than the unvisited Lufiji river, which reaches the east coast in Lat. 8° S. It does not, however, contain any opinion as to the ultimate outflow of the Chambeze lake-chain, and this may be to westward.

**New Guinea.**—A very interesting *résumé* of the efforts now being made to explore this the least known, though perhaps the largest, of the East India Islands, its area being more than double that of the British Isles, is given in *Petermann's Mittheilungen*. The causes which have now made this equatorial island a centre of attraction appear to be as varied as the nationalities among which interest has been excited. A Russian expedition, having the scientific exploration of New Guinea for its chief object, left St. Petersburg in October 1870 (see *Academy*, vol. ii. p. 442), and, passing through the Straits of Magellan by Tahiti and the Samoan Archipelago, rested at Astrolabe Bay, a deep inlet of Papua, in September 1871. Letters received from the leader of the expedition, N. v. Maklai, state that he contemplated remaining at this station for a few months to study the habits and language of the natives before attempting to penetrate into the interior. The Papuans of this coast are exceedingly savage, have no knowledge whatever of the use of iron, and few had ever seen Europeans. An expedition from Italy, under Odoardo Beccari, a botanist known through his travels in Borneo and the Bogos country, and de Albertis, is also believed to be at present in the neighbourhood of New Guinea. Commercial relations have recently sprung up between the islands of Torres Strait and the south coast of New Guinea, and these trade channels may afford useful

openings for exploration. Last year the London Missionary Society founded a number of stations on the south-eastern peninsula, under charge of educated natives of the Tonga Archipelago; the missionaries Murray and Macfarlane, under whose superintendence these stations were established, describe the splendid tropical scenery of Redscar Bay, closed inland by the massive heights of Stanley Mountains, rising 13,000 feet. At this place an earthen jar was presented by the natives to one of the missionaries, and the gold dust used in its composition giving evidence of the presence of the precious metal in this neighbourhood, a vessel carrying sixty gold-diggers was fitted out at Sydney in January 1872 to explore the coast; it suffered shipwreck on the reefs during the passage. A movement favouring a German colonization of New Guinea [having been propagated in Australia, the Dutch have been awakened to a sense of their property in the island, and a vessel has left Batavia to take formal possession of that district which does not fall within the nominal limit of their territories in the East Indies.

**The Russian Geographical Societies.**—The explorations recently carried on under the auspices of the Imperial Geographical Society of Russia and its branches at Irkutsk, Tashkend, Orenburg, and Tiflis, along the whole vast line of Asiatic and European frontier, forms the subject of an essay by Herr Spörer in the above mentioned journal. In the farthest corner of Asiatic Russia, the expedition of 1870 to the land of the Tchukchees has led to the publication of a new general map of North-eastern Siberia, while the meteorological station founded at Verkhoiansk has already added to our knowledge of the climate of the far north. The important journey of the Archimandrite Palladius in the Amur-Ussuri region and Manchuria has already been noticed in the *Proceedings of the Royal Geographical Society*; the map of his companion, the topographer Nachwalnych, is a most valuable addition to Asiatic geography. Of not less import was Prschewalski's expedition to the land of the Ordos tribes and the Koko Nor, though the results of his travels have not yet been made public. In Western Mongolia official journeys have been made to Khobdo and Uliassutai; then we have Fedchenko's exploration through Kokand to the borders of Eastern Turkestan; and the labours of M. Struve, who has determined the accurate cartography and longitudes of many points in Western Turkestan. Kuldsha has been taken possession of by Russia, and this is the starting-point for an examination of the range of the Thian Shan. Along the East Caspian coast the garrisoned positions of Krasnovodsk, Michaelovsk, and Mulla-Kari, appear to be a failure from a commercial and strategic point of view, as they are rendered almost uninhabitable from their barren and waterless condition, and are separated by the desert from the trade of Khiva. The meteorological stations founded at Krasnovodsk and Fort Alexandrovsk, on the peninsula of Mangischlak, on the other hand, are a real gain to science. A railway connecting the Black Sea with the Caspian through Tiflis, as is proposed, would greatly facilitate commerce with Persia. The frontier country of Trans-Caucasia is being examined by the experienced explorers Radde and Sivers, and very interesting results respecting the vertical distribution of vegetation are being collected.

**The Movement of Depression of the Andes.**—The number of *Ausland* for May 13 gives a list of the altitudes of some of the more important points in the Andes, determined at distinct intervals of time. The heights were found to have diminished on each occasion that they were measured. Quito was found by La Condamine in 1745 to be 9596 feet above the sea; by Humboldt in 1803, 9570 feet; by Boussingault in 1831, 9567 feet; by Orton in 1867, 9520 feet; and by Reiss and Stübel in 1870, 9350 feet. Quito has sunk 246 feet in 125 years, and Pichincha 218 feet in the same period. Its crater has sunk 425 feet during the last twenty-six years, and Antisana 165 feet in sixty-four years. Numbers are given in each case tracing their gradual descent.

A paper on recent geographical work in the United States appears in the *American Journal of Science* for May. During the past years the triangulation of Lakes Superior, Michigan, St. Clair, and Champlain, has been in progress, while other surveys are being carried on by Wheeler, in Nevada and Arizona, of the territory south of the Central Pacific Railway; by Raymond of the River Yukon in Alaska, as well as that of the Fortieth Parallel by Professor King. Many surveys and reconnaissances have been made by the Engineer Corps, or are in progress, of the Western River; among them one of the vicinity of Vicksburg, "the key of the Mississippi valley," was undertaken through a too well founded apprehension that the river will seek a new channel at that point and leave Vicksburg an inland town. The reconnaissance of a second railway route across the continent by way of the Upper Missouri and the Columbia Valley has added greatly to the knowledge of that country.

An important original paper, illustrated with a map, describing the mountainous country which forms a continuation of the highland of Abyssinia to the northward, and its inhabitants, now under Egyptian rule, has been published by "Pasha" Munzinger, the well-known explorer, in *Petermann's Mittheilungen*. An account of this journey by Dr. Beke was given in the *Athenaeum*.

The *Zeitschrift der Gesellsch. für Erdkunde zu Berlin*, No. 36, contains a synopsis, extending over more than seventy pages, of books, essays, maps, and plans, that have appeared, either separately or in journals, between December 1870 and the end of November 1871, on matters relating to geography. It is prepared by Dr. Koner, the editor of the *Zeitschrift*, and is very useful for reference.

### Zoology.

**On a Malformation of the Palate in Young Lions.**—In a paper "On Hereditary Transmission of Structural Peculiarities" (*British and Foreign Med.-Chir. Review*, April) Dr. Ogle has collected a number of more or less well-authenticated cases referring to this subject. The observations made on the breeding of lion-cubs in our Zoological Gardens are of some practical interest. The author has been informed by Mr. Bartlett, the superintendent of the gardens in Regent's Park, that he had seen about fifty lion-cubs born in that menagerie, and that more than 90 per cent. had cleft palates. They are unable to suck the mother, and soon perish. On the other hand, in the Dublin Zoological Gardens not less than eighty-six lion-cubs have been successfully reared, this number representing rather more than nine-tenths of those born. Professor Haughton considers that this difference is not attributable to climate, but is due to the different method of feeding the parents; while in London the lions are fed on beef and horse-flesh, with bones which they may gnaw, but of which they are unable to eat any portion, Professor Haughton feeds the lionesses in Dublin twice a week on goat's meat. They devour the entire animal, bones and all, thus acquiring the requisite amount of bone phosphates for the perfect development of the cubs. Any other small animal will answer as well as the goat. Before this plan was adopted in the Dublin gardens, the cubs born there perished from the same malformation of the palate as in London. Professor Haughton's experience is in perfect accordance with another fact, viz. that birds of prey which are taken when very young from the nest, and fed exclusively on meat without bone, never acquire sufficient strength of bone to be able to fly or even to stand. Although they grow to nearly the normal size, their skeleton lacks the earthy matter, and remains so soft that the bones are easily bent or broken.

The Zoological Society of London have just issued the third part of their *Proceedings* for the year 1871, and the concluding portion of the seventh volume of their *Transactions*. There can be no question that these publications are unrivalled in periodical zoological literature, in respect of variety and quantity of contents and beauty of illustration, and are not surpassed by any other similar work as regards the importance of some of the memoirs. And it is one of the greatest boons to the working zoologist that the flourishing state of the finances of the society allows these valuable publications to be delivered to the fellows and members for the low price of a guinea. We could not give here in any detail a list of the contents of this volume of the *Proceedings*. It consists of 823 pages, and is illustrated with 76 plates (most of them coloured), and a large number of woodcuts. Among the 154 communications we find some 20 noteworthy papers on Mammals, 47 on Birds, 10 on Reptiles, 7 on Fishes, 16 on Mollusks, one on Crustaceans, one on Arachnids, 7 on Insects, and 8 on the remaining lower animals.—The seventh volume of the *Transactions* contains 609 pages, and is illustrated with 73 plates, the following being the most recently published memoirs:—7. P. L. Selater, "On Certain Species of Deer now or lately living in the Society's Menagerie" (pp. 333-352). 8 and 9. R. Owen, "On *Dinornis*," parts xv. and xvi. (pp. 353-396). 10. W. Peters, "Contributions to the Knowledge of *Pectinator*, a Genus of Rodent Mammalia from North-Eastern Africa." 11. J. Murie, "Researches upon the Anatomy of *Pinnipedia*; part i. On the Walrus" (pp. 411-464). 12. J. Murie, "On the Dermal and Visceral Structures of the Kagu, Sun-bittern, and Boatbill" (pp. 465-492). 13. R. O. Cunningham, "On some Points in the Anatomy of the Steamer-duck (*Micropterus cinereus*)" (pp. 493-502). 14. J. Murie, "On the Female Generative Organs, Viscera, and Fleshy Parts of *Hyaena brunnea*" (pp. 503-512). 15. R. Owen, "On the Dodo; part ii. Notes on the Articulated Skeleton of the Dodo (*Didus ineptus*) in the British Museum" (pp. 513-526). 16. J. Murie, "Researches upon the Anatomy of the *Pinnipedia*; part ii. Descriptive Anatomy of the Sea-lion (*Otaria jubata*)" (pp. 527-596).

**Annali del Museo civico di Storia naturale di Genova.**—The second volume of this periodical has just been issued; it is published under the auspices of the Marquis J. Doria, to whom his native city is indebted for the foundation of a museum of natural history, which appears to be developing into one of the most important scientific institutions in Italy. The present volume contains the following papers:—1. G. Canestrini, "On Italian *Ophionidae*" (pp. 5-48). 2. P. M. Ferrari, "The *Aphididae* of Liguria" (pp. 49-85). 3. S. Trinchese, "A New Genus of the Family of *Aeolididae* (*Ercolania*, from the Mediterranean)" (pp. 86-132). 4. G. Mayr, *Formicidae borneenses* (pp. 133-155). This volume is illustrated with thirteen beautiful plates, part of which are coloured.

*Faune des Vertébrés de la Suisse*, par Victor Fatio. Vol. III. : *Histoire naturelle des Reptiles et des Batraciens*. Genève et Bâle. With 5 plates.—The first volume of this work, containing the mammals, appeared in 1869; the second, which will contain the birds, is in the course of preparation. Although the subject of this volume is partly the same as that of Leydig's *Saurians*, which was noticed in the *Academy*, No. 44 (vol. iii. p. 112), it is treated in a very different manner, the author's original observations being directed more to the habits and external characters of the various species than to their internal structure. The work will be found of great service to the local naturalist, but for the general student it contains too much matter regarding questions of classification, derived from standard works on herpetology. It is, however, of interest to know Dr. Fatio's reasons which induce him to distinguish two kinds of tessellated snakes (*Tropidonotus viperinus* and *T. tessellatus*), and two of brown frogs (*Rana temporaria* and *Rana agilis*).
